

INCH-POUND

MIL-PRF-32402

19 March 2013

PERFORMANCE SPECIFICATION

CONTAINER, CARGO
TRIPLE CONTAINER 5 (TRICON 5)

This specification is approved for use by all Departments and Agencies of the Department of Defense.

1. SCOPE

1.1 Scope. This specification describes a 6 feet (ft) 5-1/2 inches long by 8 ft wide by 8 ft high (1968 millimeters (mm) by 2438 mm by 2438 mm) (external measurements) reusable International Standards Organization (ISO) compliant triple container 5 (Tricon 5) used for the storage, transportation and distribution of dry cargo.

1.2 Description. Tricon 5s will be manufactured to the latest ISO standards and their corresponding amendments as described in this document. Three Tricon 5s, when coupled together, will be an ISO compliant empty shell container with tie downs and will measure 19 ft 10-1/2 inches long by 8 ft wide by 8 ft high (6058 mm by 2438 mm by 2438 mm) (external measurements) and will be in accordance with this specification. Throughout this document, three Tricon 5s coupled together are referred to as a 20-foot module.

2. APPLICABLE DOCUMENTS

2.1 General. The documents listed in this section are specified in sections 3, 4, or 5 of this specification. This section does not include documents cited in other sections of this specification or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, or 5 of this specification, whether or not they are listed.

Comments, suggestions, or questions on this document should be addressed to U.S. Army RDECOM, Tank Automotive Research, Development and Engineering Center, ATTN: RDTA-EN/STND/TRANS MS #268, 6501 E. 11 Mile Road, Warren, MI 48397-5000 or sent by email to usarmy.detroit.rdecom.mbx.tardec-standardization@mail.mil. Since contact information can change, you may want to verify the currency of this address information using the ASSIST Online database at <https://assist.dla.mil>.

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

MIL-PRF-32402

3. REQUIREMENTS

3.1 First article. When specified (see 6.2), a sample shall be subjected to first article inspection in accordance with 4.2.

3.2 Materials. The Tricon 5 containers and connecting couplers shall be fabricated from materials that are inherently corrosion resistant. The materials shall have no adverse effect on the health of personnel when used for its intended purpose. Toxic chemicals, hazardous substances, or ozone depleting chemicals (ODCs) shall not be used. No radioactive materials, mercury, or cadmium plating shall be used. Care shall be exercised during design and in all material selection to reduce or eliminate the need for hazardous materials and emissions of volatile organic compounds (VOCs) throughout the product's lifecycle.

3.2.1 Dissimilar metals. Dissimilar metals shall not be used in intimate contact with each other unless protected against galvanic corrosion in accordance with MIL-STD-889.

3.2.2 Recycled, recovered, or environmentally preferable materials. Recycled, recovered, or environmentally preferable materials should be used to the maximum extent possible provided that the material meets or exceeds the operational and maintenance requirements, and promotes economically advantageous life cycle costs. Used, rebuilt or remanufactured components, pieces, and parts shall not be incorporated into Tricon 5 containers.

3.3 Corrosion prevention.

3.3.1 Material deterioration prevention and control. The Tricon 5 containers shall operate for an expected 20-year service life without performance degradation due to corrosion. No actions beyond normal washing and pressurized washing with a minimum pressure of 90 pounds per square inch (psi), scheduled maintenance (exclusive of paint touch up), repair of accidentally damaged areas (not a result of intended use, deficiency in design, materials, manufacturing or normal wear), and replacement of damaged paint shall be necessary to keep the corrosion prevention in effect. The connecting couplers (see 3.6.3) shall be considered part of the Tricon 5 container and shall also meet the 20-year service life; regardless that normal use of couplers could degrade standard corrosion protection methods.

3.3.1.1 Nuclear, biological and chemical (NBC) survivability. Materials shall be selected which can be decontaminated without degradation when cleaned with currently approved DoD military decontamination solutions per FM 3-11.5. This requirement shall only apply to Tricon 5s that use CARC systems.

3.3.2 Chemical Agent Resistant Coating (CARC) system. Unless otherwise specified (see 6.2), Tricon 5s shall be coated with a CARC system. Except as specified in 3.3.2.1 thru 3.3.2.3, the containers shall be cleaned, pretreated, primed and topcoated in accordance with the coating manufacturer's recommendations for the specific coating system that is used.

MIL-PRF-32402

3.3.2.1 CARC cleaning and pretreatment. Galvanized steel shall be pretreated with zinc phosphate per TT-C-490.

3.3.2.2 CARC primer. Any welds and heat affected zones in galvanized steel shall be coated by zinc rich primer or thermal spray zinc to restore the zinc finish or provide equivalent protection provided by the zinc. All organic zinc rich coatings shall be in accordance with A-A-59745 with exception that the zinc content shall be 85% or higher by weight in dry film.

3.3.2.3 CARC topcoat. The application of the CARC system shall be performed in accordance with MIL-DTL-53072 on all interior and exterior metal surfaces unless otherwise specified (see 6.2). Topcoat color shall be Green 383, Color Number 34094 of FED-STD-595 unless otherwise specified (see 6.2). Topcoat color may also be Tan 686A, Color Number 33446; Gray, Color Number 36463; or White, Color Number 37875 of FED-STD-595 when specified (see 6.2). The coating system shall be selected to provide resistance to environmental degradation and coating chipping (see 4.5.3.2). The color of interior surfaces shall be Green 383, Color Number 34094 of FED-STD-595 unless otherwise specified (see 6.2). The interior paint color should match exactly to the exterior paint color as the default. If a contrasting interior color is required, it should be applied to the ceiling, floor and both interior side walls; 4 surfaces total. Note: The interior of the cargo door panels should be painted to match the exterior color of the container as the open cargo doors can be folded back against the side walls of the container.

3.3.3 Non-CARC paint. When specified (see 6.2), Tricon 5s shall be coated with a non-CARC paint system. Non-CARC Tricon 5s shall be painted in accordance with best commercial practices for shipping containers, except that the minimum requirements described in 3.3.3.1 thru 3.3.3.3 shall be met.

3.3.3.1 Non-CARC cleaning and pretreatment. Tricon 5s shall be cleaned and pretreated in accordance with SSPC-SP10 such that the surface is a near-white blast cleaned surface, when viewed without magnification. All Tricon 5 surfaces shall be free of all visible oil, grease, dirt, dust, mill scale, rust, paint, oxides, corrosion products, and other foreign matter, except for staining. Staining shall be limited to no more than five percent of each square-inch (in²) of surface area and may consist of light shadows, slight streaks, or minor discoloration caused by stains of mill scale, or stains of previously applied paint. Before blast cleaning, visible deposits of oil or grease shall be removed by any of the methods specified in SSPC-SP1.

3.3.3.2 Non-CARC primer. A zinc epoxy primer shall be used as a corrosion preventive measure with a minimum wet film thickness of 3.5 mils but not greater than 5.3 mils, and a minimum dry film thickness of 2.0 mils but not greater than 3.0 mils. The zinc content of the zinc epoxy primer shall be a minimum of 65 percent by weight.

3.3.3.3 Non-CARC topcoat. A topcoat shall be applied and shall have a minimum wet film thickness of 5.4 mils but not greater than 13.5 mils, and a minimum dry film thickness of 2.0 mils but not greater than 5.0 mils. Topcoat color shall be Green 383, Color Number 34094 of FED-STD-595 unless otherwise specified (see 6.2). Topcoat color may also be Tan 686A, Color Number 33446; Gray, Color Number 36463; or White, Color Number 37875 of FED-STD-595

MIL-PRF-32402

when specified (see 6.2). The coating system shall be selected to provide resistance to environmental degradation and coating chipping. The color of interior surfaces shall be Green 383, Color Number 34094 of FED-STD-595 unless otherwise specified (see 6.2). The interior paint color should match exactly to the exterior paint color as the default. If a contrasting interior color is required, it should be applied to the ceiling, floor and both interior side walls; 4 surfaces total. Note: The interior of the cargo door panels should be painted to match the exterior color of the container as the open cargo doors can be folded back against the side walls of the container.

3.3.4 Undercoating. When specified (see 6.2), in addition to painting, the underside of the containers shall be coated with Tectyl 121B 2.8 Volatile Organic Content (VOC) (Daubert Chemical Company) or equal to further prevent corrosion.

3.4 Operating and design requirements.

3.4.1 Construction. Unless otherwise specified herein, the container shall meet the requirements of ISO 1496-1, including applicable amendments, for a 1C container. The grapppler arm optional feature is not required.

3.4.1.1 Dimensions. The minimum internal dimensions and the actual external dimensions and tolerances shall be in accordance with table I. Interior length dimensions from the interior back wall sill to the edge of the connector-locking holder device (see 3.6.3) located on the bottom half of the interior of the right door shall be no less than 67.32 inches (1710 mm). The external dimensions of three Tricon 5s coupled together as a 20-foot module shall be 19 ft 10-1/2 inches by 8 ft by 8 ft (6058 mm by 2438 mm by 2438 mm). Unless otherwise specified herein, the minimum internal dimensions, actual external dimensions, tolerances, and diagonal differences of the container shall be in accordance with ISO 668. Each Tricon 5 shall have a minimum storage capacity of 343 cubic feet (9.73 cubic meters) when measured without shelving, decking beams, and rack and cabinet systems.

TABLE I. Tricon 5 dimensions.

	Length	Width	Height
Interior (minimums)	70.94 inches (1,802 mm)	93.70 inches (2,380 mm)	88.82 inches (2,256 mm)
Exterior	77.50 (+0, -0.079) inches (1969 (+0, -2.0) mm)	96.0 (+0, -0.188) inches (2438 (+0, -5.0) mm)	96.0 (+0, -0.188) inches (2438 (+0, -5.0) mm)

3.4.1.2 Weight. The tare weight of the empty Tricon 5 shall not exceed 2,800 pounds (1,270 kg) without shelves.

3.4.1.3 Gross weight ratings. The maximum gross weight rating of an individual Tricon 5 shall be 14,900 pounds (6,758 kg). The three Tricon 5s coupled as a single container shall have a maximum gross weight rating of 44,700 pounds (20,280 kg).

MIL-PRF-32402

3.4.1.4 Payload. Container payload is as defined in ISO 1496-1.

3.4.1.5 Doors. Tricon 5s shall have two sets of double doors, located on both the rear end and front end of the container. Doors shall conform to ISO 1496-1 except as specified in this paragraph and in table II. Each door shall have a mechanically attached gasket (seal) capable of meeting all operating environment requirements of 3.5, 3.5.1, and 3.5.2, including conditions of high heat and relative humidity (RH) combined (+140 °F and 95% RH) to provide a weathertight seal. Doors shall be hung on the 96-inch (2438-mm) container frame (external width) and shall open to not less than the dimensions specified in table II. Each door shall be provided with a minimum of one exterior heavy-duty, handle operated cam-locking device with anti-rack provisions, which through lever type action aids in releasing the door seal from the doorframe. Each locking device handle must be capable of accepting a padlock and security seal. All locking rods (see figure 3) shall be mounted such that they cannot be removed by mechanical means from the exterior side of the container to deter pilfering and gain access to the container contents. Means shall be provided to hold and secure the doors in the full open position and shall be of a material which shall not scrape or chafe the container when the doors are closed. All moving parts of the door locking mechanism and door hinges shall be permanently lubricated. Each door shall swing out to the fully open position of 270 degrees for ease of loading. The starting position for the door swing measurement shall be at the horizontal centerline of each door while in the closed position. The distance between the centerline of each container door handle shall not be less than 35.5 inches (901.7 mm) and not greater than 36 inches (914.4 mm) from the bottom of each Tricon 5 (see figure 10). The height of the primary door locking bar saddle shall be a minimum of 4 inches (101.6 mm) to permit improved security.

TABLE II. Tricon 5 door opening dimensions (all dimensions are minimums).

Height	Width
84.92 inches (2157 mm)	92.00 inches (2337 mm)

3.4.1.6 Side walls and end walls strength. All Tricon 5 end and side walls, including walls that contain doors, shall meet the ISO 1496-1 strength requirements for side walls.

3.4.1.7 Floor.

3.4.1.7.1 Floor strength. The floor shall be designed and installed to support the container's payload.

3.4.1.7.2 Floor construction. The floor shall be watertight and shall be permanently attached to its bottom side rails and cross members.

MIL-PRF-32402

3.4.1.8 Roof.

3.4.1.8.1 Roof strength. The roof shall exhibit not more than 1/4 inch (6.35 mm) permanent deformation when loaded as described in the ISO 1496-1 roof strength test.

3.4.1.8.2 Roof draining. The roof shall be self-draining. No water shall leak into the assembled 20-foot module or any individual Tricon 5 container, and the roof shall retain not more than 1/8 inch of water when the Tricon 5 is tested in accordance with the ISO 1496-1 weatherproofness test and is level to within 5 degrees.

3.4.1.9 Lifting from top corners. When loaded and lifted as described in the top corner lifting test in ISO 1496-1, no part of the base of the 20-foot module shall deflect more than 1 inch (25.4 mm) below the plane formed by the bottom faces of the bottom corner fittings. The container shall be able to be lifted from the top corners without permanent deformation, dislocation, damage to or failure of the containers or connectors. These requirements shall also apply to individual Tricon 5s.

3.4.1.10 Lifting from bottom corners. 20-foot modules shall meet the requirements for lifting from the bottom corners as described in ISO 1496-1.

3.4.1.11 Container strength. 20-foot modules shall meet the requirements of ISO 1496-1 for the following loading conditions:

- a. longitudinal restraint
- b. transverse rigidity
- c. longitudinal rigidity
- d. lifting from forklift pockets

3.4.1.12 Seams. Tricon 5 seams shall be sealed with chloroprene/neoprene type sealant where necessary such that the Tricon 5 shall be weathertight.

3.4.1.13 Anti-pilferage provisions. Hinge-pins and screws, bolts, and other fasteners used for securing the hinges and closing devices to the container, and for holding the essential parts of the sides, ends and roof, shall be welded or otherwise secured in such a manner as to prevent access to the interior of the container without leaving visible signs of tampering. Where such welding destroys the protective coating on the items being welded or on other container parts, the protective coating and the surrounding areas shall be restored to the original condition. All locking device handles shall be furnished with provisions for padlocking and customs sealing. When specified (see 6.2), the locking provisions shall include a steel locking bar and security seal system to deter pilfering, and to permit the rapid identification of tampering used to gain access to the container. When connected and when specified (see 6.2), the locking bar shall be secured to both the left and right door locking rod on each set of double doors provided, and the security seal or cable shall be connected to both the locking rod (see figure 3) and the door catch mechanism in lieu of a padlock (the security seal or cable shall be a bright color such that it is easily recognizable when it has been removed and tampering has occurred). All locking rods

MIL-PRF-32402

(see figure 3) shall be mounted such that they cannot be removed by mechanical means from the exterior side of the container to deter pilfering and gain access to the container contents. The Transport Internationale des Routiers (TIR) plate (see 3.8.3) shall be mounted on the interior flange of the secondary door as identified on figure 10 to further deter pilferage from prying. The distance as measured from the bottom of the Tricon 5 to the centerline of the TIR plate shall not be less than 82.5 inches (2,095.5 mm) and not greater than 83 inches (2,108.2 mm). A padlock protection box shall be provided such that the box shall prevent bolt cutters from being used on the padlock. The padlock shall be accessible through the bottom of the box, and the box shall be composed of two sections. The section on the right-hand, or primary door, shall contain a covered protection box with a slotted plate designed to receive the protruding plate attached to the left hand, or secondary door. The left-hand, or secondary door, shall contain a protruding plate with a padlock shackle hole in it, and the protruding plate shall be designed to pass through the slotted plate on the right-hand door. When both doors are closed the protruding plate shall pass through the slotted plate and expose the padlock shackle hole inside the protection box. The padlock shackle shall be able to be passed through the padlock shackle hole in the protruding plate of the left hand, or secondary door; and the padlock shall be able to be secured without tools. The padlock protection box shall be composed of minimum 1/4-inch corrosion resistant steel. When specified (see 6.2), each Tricon 5 shall be provided with a Type P01 captive padlock conforming to ASTM F833 with two keys.

3.4.1.14 Shoring slots. Tricon 5s shall have shoring slots on both interior walls, immediately adjacent to each set of double doors, from floor to ceiling. All shoring slots shall begin inside the Tricon 5 not more than 3-3/4 inches (95.2 mm) from the closed-doors to restrain the cargo and prevent it from forcing the door open during sudden stops or tilts of the container during transportation. The shoring slots shall be a minimum of 1-5/8 inches (41.2 mm) wide to allow for the attachment of round shoring support bars. The shoring slot shall support loading equal to 0.4 times the maximum permissible payload of an individual Tricon 5 container (P_g in ISO 1496-1) applied in the longitudinal direction at any point along the shoring slot. Door opening dimensions as specified in 3.4.1.5 shall not be obstructed by the shoring slots. The spacing of the shoring slot tie downs, in each shoring slot, shall be every 15 inches (381 mm) starting at the floor. Shoring slot tie downs shall be fabricated from 0.5-inch (12.7-mm) round bar, and shall be located in each slot. Door opening dimensions shall not be obstructed by the shoring slots.

3.4.1.15 Vertical logistic tracks. Each Tricon 5 shall contain a total of six Series E or Series A vertical logistic tracks (see 6.5) which are made of high strength 12-gauge steel. Each set of three vertical logistic tracks shall be individually welded and equally spaced on the Tricon 5 roadside and curbside walls, and as identified on figure 1. A Series E or A vertical logistics track shall be near the center of each roadside and curbside wall, within the limits of the corrugation pitch, and the remaining four shall be near each corner of each roadside and curbside wall. The 1-inch (25.4-mm) minimum welds, equally spaced apart a minimum of 4 inches (101.6 mm) from center to center, shall be used on each side of each vertical logistic track. The distance from the container floor to the centerline of the first slot from the floor of each vertical logistic track shall be a maximum of 9 inches (228.6 mm), and the distance from the container ceiling to the centerline of the first slot from the ceiling of each vertical logistic track shall be a

MIL-PRF-32402

maximum of 9 inches (228.6 mm). All vertical logistic tracks shall be one continuous length, and shall correspond with one another and be of the same distance from the floor (± 0.12 inches) (± 3.048 mm).

3.4.1.16 Shelf decking beams and shelving.

3.4.1.16.1 Shelf decking beams and shelving. Each Tricon 5 shall be provided with 6 shelf decking beams when specified (see 6.2). The length of the shelf decking beam shall be adjustable to accommodate variations in the distance between vertical logistic tracks caused by distortion during use. Shelf decking beams, when connected to the Series E or Series A vertical logistic tracks, shall be positively secured in all directions (i.e., right to left, and up and down). The shelf decking beam connection shall have some type of locking device that secures the shelf decking beam to the Series E or Series A vertical logistic track. This locking device shall allow easy and quick installation and removal of the shelf decking beam without the use of any tools. Each full size decking shelf shall have a working load capacity rating of not less than 2,000 pounds (907 kg) uniformly distributed over a shelf spanning three shelf decking beams as depicted on figure 2, and connected at the same level to each vertical track. Additional shelf decking beams shall be provided when specified (see 6.2).

3.4.1.16.2 Shelf material. Shelving shall be comprised of a non-absorbing composite material.

3.4.1.16.3 Type 5 Tricon with 1 shelf. When specified (see 6.2), this shelf system shall consist of 1 longitudinal full shelf consisting of two pieces each measuring a minimum of 64.25 inches long by 46.50 inches wide and shall be 1 inch thick. A minimum of three (3) decking and shoring beams shall be included with this shelf system.

3.4.1.16.4 Type 5 Tricon with 2 shelves. When specified (see 6.2), this shelf system shall consist of 2 longitudinal full shelves consisting of 4 pieces each measuring a minimum of 64.25 inches long by 46.50 inches wide and shall be 1 inch thick. Each full shelf shall consist of 2 pieces and a minimum of three (3) decking and shoring beams, and therefore a minimum of six (6) decking and shoring beams shall be required with this shelf system.

3.4.1.17 Tie downs. Tricon 5s shall be provided with top rail, bottom rail, shoring slot tie downs, and recessed floor tie downs per 3.4.1.17.1, 3.4.1.17.2, and 3.4.1.17.3. All tie downs shall be capable of accepting snap hooks or 1-inch (25.4 mm) wide metal strapping without tearing the strapping. Adequate clearance shall be provided at the tie down for attachment of a metal hook with adjustable webbing, and with minimum hook dimensions as specified on figure 7. The tie down provisions shall restrain the load without weld failure, permanent deformation, cracking, loosening, or breaking of the provision or its connecting structural components.

MIL-PRF-32402

3.4.1.17.1 Top and bottom rail tie downs.

3.4.1.17.1.1 Top and bottom rail tie down placement. A total of 20 top and bottom rail loop tie downs shall be provided in each Tricon 5 as depicted on figure 1 and as described in table III. Tricon 5s shall have 5 loop tie downs welded on the top and bottom rails of the roadside and curbside walls for a total of 20 loop tie downs as shown in table III. All loop tie downs shall be constructed of 1/2-inch (12.7 mm) rod steel and formed into a loop as depicted on figures 1 and 8. All top and bottom rail loop tie downs shall be positioned as shown on figure 1. There shall be a minimum distance of 90-1/4 inches (2292 mm) between the inside of each bottom rail loop tie down on each side wall and the inside of the corresponding tie down on the opposite side wall. The measurement shall be taken parallel to the floor and perpendicular to the end walls.

3.4.1.17.1.2 Top and bottom rail tie down load rating. All top and bottom rail loop tie downs shall withstand a 4,000-pound load at an angle of 45 degrees from the horizontal and 45 degrees from the vertical without permanent deformation.

3.4.1.17.2 Corner post and shoring slot tie downs.

3.4.1.17.2.1 Corner post and shoring slot tie down placement. A total of 20 shoring slot tie downs shall be provided in each Tricon 5 as shown on figure 1 and in table III. Tricon 5s shall have 5 shoring slot tie downs on each door side corner post, and they shall be positioned at 15, 30, 45, 60, and 75 ($\pm 1/2$) inches (381, 762, 1143, 1524, and 1905 (± 12.7) mm) respectively, starting from the floor as shown on figure 1 and in table III. Corner post and shoring slot tie downs shall be constructed of 1/2-inch (12.7 mm) rod steel and welded to the corner post as shown on figure 1 and as required in 3.4.1.14.

3.4.1.17.2.2 Corner post and shoring slot tie down load rating. All shoring slot tie downs shall withstand a 4,000-pound load at an angle of 45 degrees from the horizontal and 45 degrees from the vertical without permanent deformation.

3.4.1.17.3 Recessed floor tie downs.

3.4.1.17.3.1 Recessed floor tie down placement. A total of 8 recessed floor tie downs shall be provided in each Tricon 5 as depicted on figure 1 and in table III. Tricon 5s shall have 3 recessed floor tie downs on each door side, and 1 recessed floor tie down on both the roadside and curbside wall sides. The door side tie downs shall be 6 inches from each door sill, and the roadside and curbside tie downs shall be located along the centerline of the road and curbside walls; each 5 inches from their respective walls.

3.4.1.17.3.2 Recessed floor tie down load rating. All recessed floor tie downs shall withstand a 4,000-pound load at an angle of 45 degrees from the horizontal and 45 degrees from the vertical without permanent deformation.

MIL-PRF-32402

TABLE III. Configuration of tie downs.

Top Rails	Bottom Rails	Recessed floor	Shoring slot
10 total (5 on curbside wall and 5 on roadside wall).	10 total (5 on curbside wall and 5 on roadside wall).	8 total (One 5 inches from roadside wall and one 5 inches from curbside wall; and three 6 inches from each door wall).	20 total (5 each door side corner).

3.4.1.18 Vents. All containers shall have minimum of two passive ventilating systems comparable to those used on commercial ISO containers. The vents shall be located in upper diagonal corners on opposite walls or doors such that they provide maximum diagonal cross airflow and hot air exhaust, and they shall be designed to deflect rain or spray and prevent water ingress. As a minimum, the external venting surface area of each vent shall be 452 mm² (0.7 in²) to permit depressurization of the Tricon 5 during air transportation. When specified (see 6.2), vents shall be able to be opened and closed, without tools, from the outside of the Tricon 5. There shall be no air flow through the vents when they are in the closed position. These opening and closing vents shall be able to lock in place in both the open and closed positions such that they shall remain in their set position.

3.4.1.19 Manifest box. When specified (see 6.2), two manifest boxes shall be provided on each container. One shall be securely and rigidly fastened to the inside of the right hand door, and one to a flat surface of the outside upper portion of the right hand door as depicted on figure 3. The manifest box on the inside shall not interfere with the shelving area at any level. The manifest box on the outside shall be designed and located in an area that minimizes interference or damage with forklift carriages and backrests being used to lift the Tricon 5. The manifest box shall be weathertight with a hinge type cover, painted to match the interior or exterior color. The manifest box shall be designed to hold an 8-1/2 inches by 11 inches by 1-1/4 inches thick document (215.9 mm by 279.4 mm by 31.75 mm).

3.4.1.20 Rack and cabinet systems. Rack and cabinet systems shall be provided when specified (see 6.2).

3.4.1.21 Voids, recesses and protrusions. The Tricon 5 container shall be constructed to minimize recesses and voids where moisture can accumulate. No part of the Tricon 5 container shall protrude beyond the outside plane surfaces of the corner fittings.

3.5 Operating environmental requirements. The container shall operate under the following environmental conditions without degradation in performance, material failures, or permanent deformation. The container shall be capable of uncovered long term storage in extreme hot and cold climate, high humidity, blowing sand, dust, heavy snows, mud, soft ground, earthquakes, debris, or combination of the above, as defined in AR 70-38 to include stowage on Pre-Positioning (PREPO) afloat vessels up to 30 months without loss of mission essential functions with routine unit-level (i.e., -10 level) maintenance performed every six

MIL-PRF-32402

months. Mission essential functions shall be defined as being transportable by all modes in 3.7 through 3.7.5, and being able to safely stow a full payload without any damage or deformation.

3.5.1 Storage and transit temperature. The container shall not be damaged by storage or transit in temperature conditions from -60 °F (-51 degrees Celsius (°C)) to +160 °F (+71.1 °C).

3.5.2 Operation in rain. The container shall not exhibit water leakage when subjected to the ISO 1496-1 weatherproofness test.

3.6 Interface requirements.

3.6.1 Forklift pockets and relief notches. The container shall have forklift pockets that conform to ISO 1496-1, Annex C, unless otherwise specified. Tricon 5 containers shall have four-way entry, and the entry points shall not interfere with the doors or door height requirements in 3.4.1.5. A relief notch shall be provided along the bottom rail at the corner block on all four sides of each Tricon 5. The forklift pockets on both the front and rear walls shall be a minimum 4.0 inches high by 14.5 inches wide. The forklift pockets on both the curbside and roadside walls shall be a minimum 4.5 inches by 14.5 inches wide and shall conform to ISO 1496-1. Each pair of door wall forklift pockets shall measure a minimum of 34.73 inches from center to center.

3.6.2 Corner fittings. All eight corner fittings on each Tricon 5 shall be bottom corner fittings as specified in ISO 1161 to permit horizontal coupling between containers. The corner fittings shall be mounted to the container so that the elongated top and bottom apertures are parallel to the side walls of the Tricon 5.

3.6.3 Connecting couplers, quantity and storage. Each container shall be provided with three connecting couplers. All connecting couplers shall be one-piece assembly units, and all connecting coupler parts shall be capable of being operated and connected to the container without any tools. Each connecting coupler shall be capable of being securely fastened to a single container's corner fitting allowing the connection to be made first to one container and then to another. The currently used coupling is NSN 3040-01-387-4048, although all connecting couplers that meet the requirements specified herein shall be permitted. Tricon 5 connecting couplers shall meet operating and storage temperature requirements specified in 3.5.1. A connector-locking holder device shall be provided to secure and store three connecting couplers. The device shall be located on the bottom half of the interior of the right door. The depth of the device shall not exceed 4-5/8 inches (117.475 mm). The length and width of the device shall be reasonably sized to allow for adequate storage and ease of use, and shall not reduce the specified internal dimensions of the container or interfere with the capability of shelves to be raised up or down.

3.6.4 Tricon 5 coupling and uncoupling. Three Tricon 5s shall be coupled with connectors to form an integral 20-foot module, which is dimensionally equivalent to, and does not violate, ISO envelope requirements for the standard ISO 1C container, unless otherwise specified herein. The coupling process shall not take more than 30 minutes using the connecting

MIL-PRF-32402

couplers provided with the three containers, 2 guides, and one forklift truck to position and assist in the connection.

3.6.5 Convention for Safe Containers (CSC) certification. The container design and each Tricon 5 shall be certified in accordance with 49CFR, Parts 450 through 453.

3.6.5.1 Container stacking. The 20-foot module shall support the following loads representing the load of eight ISO 668 1C containers stacked on top of the 20-foot module:

- a. test force per container, represented by three Tricon 5s coupled together; on all four corners simultaneously shall be 3,767 kN (846,855.3 lbf)
- b. test force per pair of end fittings shall be 1,883 kN (423,315.2 lbf)
- c. superimposed mass represented by the test force shall be 213,360 kg (470,380 lb).

The CSC plate data shall show the 9-high stacking certification.

3.7 Transportability. Individual Tricon 5s and three Tricon 5s coupled together to form an equivalent ISO 1C container, unless specified herein, shall be transportable by air, highway, marine and rail assets as specified herein. The individual container, and three containers coupled together, shall also be capable of being stacked and transported by military and commercial vehicles, and trailers, trains, marine vessels, aircraft, dolly sets, forklifts, and cranes; and shall withstand the impact forces encountered in shipment and loading without damage or permanent deformation.

3.7.1 Air transportability. Three coupled Tricon 5s, and individual Tricon 5s, shall be internally air transportable by C-130, C-5, and C-17 aircraft. Three coupled Tricon 5 containers, and individual Tricon 5s, shall be externally transportable by CH-47, V-22, CH-53, and UH-60 helicopters by sling. Individual Tricon 5 containers being shipped by air shall be capable of being attached to an approved Land, Sea and Air (LSA) Adapter. The Tricon 5 will be configured to 463L pallet dimensions when attached to the LSA adapter permitting it to be loaded on military fixed wing aircraft as identified in this paragraph.

3.7.2 Rail transportability. Three Tricon 5s coupled together as a 20-foot module, and individual Tricon 5s, shall be rail transportable in CONUS and NATO countries without restriction.

3.7.3 Marine transportability. Three Tricon5s coupled together as a 20-foot module, and individual Tricon 5s, shall be transportable by breakbulk cargo ships, Roll-On/Roll-Off (RORO) ships; C-8 and larger, Lighter Aboard Ship (LASH); barge carrying ships (SEABEE); Lighter, Amphibious, Resupply, Cargo (LARC)-LX, and larger lighter vessels; Landing Craft Utility (LCU); Landing Craft Mechanized (LCM); Landing Craft Utility (LCU) 1646 and LCU 2000 lighters and the Logistics Support Vessel (LSV); and Army barges and lighters in accordance with MIL-STD-1366. Individual Tricon 5s and three Tricon 5s coupled as a 20-foot module shall withstand, without damage, the shock, rolling and pitching normally experienced in marine transportation on the deck or in the hold of the cargo vessel. Marine transportation shall include,

MIL-PRF-32402

but not be limited to, Vertical Replenishment (VERTREP) missions and Connected Replenishment (CONREP) missions.

3.7.4 Highway transportability. Three Tricon 5s coupled together as a 20-foot module, and individual Tricon 5s, shall be capable of unrestricted highway transport.

3.7.5 Loading and handling equipment. Individual Tricon 5s, and Tricon 5s coupled in the two and three configuration, fully loaded, shall be able to be lifted and handled by suitably rated forklifts and cranes so that they may be transported in all the modes described in 3.7 through 3.7.4.

3.8 Support and ownership requirements.

3.8.1 Exterior markings. Each Tricon 5 shall be marked in accordance with ISO 6346. Example locations for the required markings are provided on figures 3 through 6, although other locations may be used provided that they conform to ISO 6346 and contain all the required data and information (see 6.2). The location of the other optional markings (see 6.2) may be specified at the time of purchase by the customer. If specified at the time of purchase, the contractor may obtain the user's serial numbers from the contracting officer (see 6.2). Unless otherwise specified, the contractor shall stencil in 1-inch (25.4 mm) letters on the exterior of the left hand door panel in the area below the CSC data plate, and as shown on figure 3: "CARC" and the month and year the Tricon 5 was painted, using a two digit numerical format. Exterior markings shall withstand pressurized washing with a minimum pressure of 90 psi without degradation.

3.8.2 Interior markings. The owner's code, serial number, and check digit, as defined by ISO 6346, shall be stamped in characters not less than 1/2-inch (12.7 mm) high. The unit number shall be located on either the top surface of the curb side rear, bottom corner fitting (close to the data plate on the door side), or on the interior surface of the curb side door header within 18 inches (457.2 mm) from the interior of the curb side, front, top corner fitting where it shall not be obscured.

3.8.3 Approval plates. The following plates or plaques shall be obtained from a designated approval authority and attached and displayed as required by the CSC, in accordance with 49CFR450 through 49CFR453:

- a. International Convention for Safe Containers (CSC)
- b. Transport Internationale des Routiers (TIR)
- c. Timber Component Treatment (TCT) Requirements of the Australian Department of Health (if applicable)

Each Tricon 5 shall be affixed with the seal of the approval authority.

MIL-PRF-32402

3.8.4 Consolidated data plate. The TACOM Natick approved consolidated data plate shall contain:

- a. International Convention for Safe Containers (CSC) data required in 3.6.5
- b. Transport Internationale des Routiers (TIR) markings
- c. Manufacturer's data plate markings

The height of the data plate shall be no less than 250 mm (9.8425 inches). The location of the consolidated data plate shall be as depicted on figure 3. The container identification number will be placed on line 3 of the CSC safety approval plate per IMO CSC.1/Circ. 138 and the example provided by 49CFR451.25. The container identification number can be the manufacturer's serial number. The container identification number may also be the ISO number, as defined by ISO 6346, which consists of the owner code (see 6.10.4), equipment category identifier (see 6.10.5), the registered serial number (see 6.10.6), and the check digit number (see 6.10.7); permitting it matches the ISO number stenciled on the container. The data required in 3.8.3, this paragraph and 3.8.5 may be included in a consolidated data plate in lieu of any separate plates.

3.8.5 Tank-automotive and Armaments Command (TACOM) data plate. Each Tricon 5 shall contain a TACOM Natick approved data plate with the following information:

- a. the Tricon 5 specification number (MIL-PRF-32402)
- b. TACOM Natick part number
- c. manufacturer's serial number
- d. TACOM assigned National Stock Number (NSN)
- e. model number
- f. contract number
- g. Department of the Army Technical Manual (DATM) number (if applicable)
- h. tare weight in pounds and kilograms
- i. and the manufacturer's name, CAGE, location and date of manufacture with ISO number per ISO 6346

3.9 Workmanship. Each Tricon 5 shall have no evidence of cracks, dents, scratches, burrs, sharp edges, pinching hazards, loose parts, missing fasteners, distortions, spatter, foreign material, or any other cosmetic or structural defects which may degrade the performance of the container.

4. VERIFICATION

4.1 Classification of inspections. The inspection requirements specified herein are classified as follows:

- a. First article inspection (see 4.2).
- b. Conformance inspection (see 4.3).

MIL-PRF-32402

4.2 First article inspection. When a first article inspection is required (see 6.2), inspection procedures are performed on an individual Tricon 5 except for the procedures indicated in table V that are carried out on three Tricon 5s coupled together as a 20-foot module. This inspection shall include the examination of 4.4 and the tests indicated in table V.

4.3 Conformance inspection. Conformance inspection shall include the examination of 4.4.

4.4 Examination. Each Tricon 5 production unit shall be examined for compliance with requirements as specified in table IV. Examination methods include visual and functional inspection, measurement by standard inspection equipment, and inspection of contractor records providing proof or certification that design, construction, processing, and materials conform to requirements. Applicable records shall include drawings, specifications, design data, receiving inspection records, processing and quality control standards, vendor catalogs and certifications, industry standards, test reports, and rating data. Nonconformance to any specified requirements or the presence of one or more defects shall be cause for rejection.

TABLE IV. Classification of defects.

Category	Defect	Method of Examination
<u>Major</u>		
101	Non-CARC painting missing or not as specified (see 3.3.3)	Doc
102	Non-CARC cleaning and pretreatment not as specified (see 3.3.3.1)	Doc
103	Non-CARC primer not as specified (see 3.3.3.2)	Doc
104	Non-CARC topcoat missing or not as specified (see 3.3.3.3)	Visual, Doc
105	Undercoating not as specified (see 3.3.4)	Visual, Doc
<u>Minor</u>		
201	Materials not as specified (see 3.2)	Doc
202	Dissimilar metals are not effectively insulated from each other (see 3.2.1)	Visual, Doc
203	Used, rebuilt, or remanufactured components, pieces, or parts used (see 3.2.2)	Doc
204	Material deterioration prevention and control not as specified (see 3.3.1)	Doc
205	NBC survivability not as specified (see 3.3.1.1)	Doc
206	CARC system missing or not as specified (see 3.3.2)	Doc
207	CARC cleaning and pretreatment not as specified (see 3.3.2.1)	Doc
208	CARC primer not as specified (see 3.3.2.2)	Doc
209	CARC paint missing or not as specified (see 3.3.2.3)	Doc
210	Color not as specified (see 3.3.2.3 and 3.3.3.3)	Visual, Doc

MIL-PRF-32402

TABLE IV. Classification of defects - continued.

Category	Defect	Method of Examination
211	Construction not as specified (see 3.4.1)	Visual, Functional, Doc
212	Dimensions not as specified (see 3.4.1.1)	SIE
213	Weight not as specified (see 3.4.1.2)	SIE
214	Weight ratings not as specified (see 3.4.1.3)	Doc
215	Doors missing or not as specified (see 3.4.1.5)	Doc, SIE, Functional
216	Side walls missing or not as specified (see 3.4.1.6)	Visual, Doc
217	End walls missing or not as specified (see 3.4.1.6)	Visual, Doc
218	Floor missing or not as specified (see 3.4.1.7)	Visual, Doc
219	Roof missing or not as specified (see 3.4.1.8)	Visual, Doc
220	Seams not as specified (see 3.4.1.12)	Visual, Doc
221	Anti-pilferage provisions missing or not as specified (see 3.4.1.13)	Visual, Functional, SIE
222	Shoring slots missing or not as specified (see 3.4.1.14)	Visual, SIE
223	Vertical logistic tracks missing or not as specified (see 3.4.1.15)	Visual, SIE
224	Vertical logistic track welds missing or not as specified (see 3.4.1.15)	Visual, SIE
225	Shelf decking beams missing or not as specified (see 3.4.1.16.1)	Visual, Functional
226	Shelf material not as specified (see 3.4.1.16.2)	Doc
227	Shelving missing or not as specified (see 3.4.1.16.3 and 3.4.1.16.4)	Visual, SIE
228	Tie downs missing or not as specified (see 3.4.1.17)	Visual, SIE
229	Top and bottom rail tie downs missing or not as specified (see 3.4.1.17.1.1)	Visual, SIE
230	Corner post and shoring slot tie downs missing or not as specified (see 3.4.1.17.2.1)	Visual, SIE
231	Recessed floor tie downs missing or not as specified (see 3.4.1.17.3.1)	Visual, SIE
232	Vents missing or not as specified (see 3.4.1.18)	Visual, Functional, SIE
233	Manifest box missing or not as specified (see 3.4.1.19)	Visual, SIE
234	Rack and cabinet systems not as specified (see 3.4.1.20)	Visual
235	Voids, recesses and protrusions not as specified (see 3.4.1.21)	Visual
236	Operating environmental requirements not as specified (see 3.5)	Doc
237	Storage and transit temperature not as specified (see 3.5.1)	Doc
238	Forklift pockets and relief notches not as specified (see 3.6.1)	Visual, SIE

TABLE V. Classification of inspections.

Requirement	Section 3	Section 4	First Article Test	
			Individual Tricon 5	20-foot module
Material deterioration prevention and control	3.3.1	4.5.2	X	
CARC coating thickness	3.3.2.2, 3.3.2.3	4.5.3.1	X	
CARC coating adhesion	3.3.2.3	4.5.3.2	X	
Non-CARC coating thickness	3.3.3.2, 3.3.3.3	4.5.4.1	X	
Non-CARC coating adhesion	3.3.3.3	4.5.4.2	X	
Side walls and end walls strength	3.4.1.6	4.5.5		X
Roof strength	3.4.1.8.1	4.5.6	X	
Lifting from top corners	3.4.1.9	4.5.7	X	X
Lifting from bottom corners	3.4.1.10	4.5.8		X
Container strength	3.4.1.11	4.5.9		X
Shoring slots	3.4.1.14	4.5.10	X	
Shelf decking beams	3.4.1.16.1	4.5.11	X	
Tie downs	3.4.1.17	4.5.12	X	
Top and bottom rail tie downs load rating	3.4.1.17.1.2	4.5.13	X	
Corner post and shoring slot tie down load rating	3.4.1.17.2.2	4.5.14	X	
Recessed floor tie down load rating	3.4.1.17.3.2	4.5.15	X	
Weatherproofness	3.5.2	4.5.16		X
Tricon 5 coupling and uncoupling	3.6.4	4.5.17	X	X
Container stacking	3.6.5.1	4.5.18		X

MIL-PRF-32402

4.5 Methods of inspection.

4.5.1 Testing criteria. Except as specified herein, any loss of form, fit, or function of the Tricon 5s during testing shall be considered a failure. Expendable items (identified prior to the test) shall retain their function for their intended service life and are not subject to these criteria.

4.5.2 Material deterioration prevention and control. Conformance to 3.3.1 shall be verified by conducting the following procedure:

- a. All container, container connecting couplers, and Tricon 5 designs shall be evaluated for corrosion prevention and control by the GMW14872, (UB), All, 4 salt sprays per cycle, Method 1/2, Exposure D cyclic corrosion laboratory test for 120 cycles to qualify the system (pretreatment, coating type(s) and coating thicknesses). To evaluate corrosion resistance, a minimum of six test coupons for each material variation and process shall be manufactured with the substrate and coating system that shall be used in production. Test coupons (4 inches (101.6 mm) by 12 inches (304.8 mm)) shall be scribed through the coating system to the substrate prior to testing. Test coupons shall be fabricated with and without CARC topcoat. There shall be no more than 1 mm scribe creep (measured from one side of the scribe) after scraping with a metal putty knife after 120 cycles of testing. There shall be no blistering and no more than 5 rust spots in any 24 in² (15,483.84 mm²) of test surface. All twelve test coupons of each test variation shall meet these acceptance requirements to be considered an acceptable design.
- b. A minimum of four connector couplings for each material variation and process shall be manufactured with the substrate and coating system that shall be used in production. Connector couplings shall be scribed through the coating system to the substrate prior to testing. Connector couplings shall be fabricated with and without CARC topcoat. There shall be no more than 1 mm scribe creep (measured from one side of the scribe) after scraping with a metal putty knife after 120 cycles of testing. There shall be no blistering and no more than 5 rust spots in any 2 in² (1290.32 mm²) of test surface. All 8 connector couplings of each test variation shall meet these acceptance requirements to be considered an acceptable design.

Any loss of form, fit, or function shall be considered a corrosion failure. Expendable items (identified prior to the test) shall retain their function for their intended service life and are not subject to these criteria.

4.5.3 CARC system. Conformance to 3.3.2 thru 3.3.2.3 shall be verified by visual inspection and by inspection of contractor records providing proof or certification that materials and processing conform to requirements. Applicable records shall include drawings, specifications, design data, receiving inspection records, processing and quality control standards, vendor catalogs and certifications, industry standards, test reports, and rating data.

MIL-PRF-32402

4.5.3.1 CARC coating thickness. Top-coat and primer coating thicknesses shall be measured in accordance with MIL-DTL-53072. Nonconformance to 3.3.2.2 or 3.3.2.3 shall constitute failure of this test.

4.5.3.2 CARC coating adhesion. Coating adhesion shall be verified by ASTM D3359 Method B and MIL-DTL-53072. Nonconformance to 3.3.2.3 shall constitute failure of this test.

4.5.4 Non-CARC paint. Conformance to 3.3.3 thru 3.3.3.3 shall be verified by visual inspection and by inspection of contractor records providing proof or certification that materials and processing conform to requirements. Applicable records shall include drawings, specifications, design data, receiving inspection records, processing and quality control standards, vendor catalogs and certifications, industry standards, test reports, and rating data.

4.5.4.1 Non-CARC coating thickness. Top-coat and primer coating thicknesses shall be measured in accordance with ASTM B499 for both wet film and dry film thickness. Nonconformance to coating thicknesses specified in 3.3.3.2 and 3.3.3.3 shall constitute failure of this test.

4.5.4.2 Non-CARC coating adhesion. Coating adhesion shall be verified as described in MIL-DTL-53072 for film builds less than 5 mils. Failure criteria is defined in MIL-DTL-53072.

4.5.5 Side walls and end walls strength. Conformance to 3.4.1.6 shall be verified by conducting the side wall and end wall strength tests in ISO 1496-1. Loading conditions specified for side walls shall be used for both the side wall and end wall tests. After completion of the test, permanent deformation of the container causing non-conformance to any requirements of this specification shall be cause for rejection.

4.5.6 Roof strength. Conformance to 3.4.1.8.1 shall be verified by conducting the roof strength test in ISO 1496-1. Permanent deformation of the roof of greater than 1/4 inch or other permanent deformation of the container causing nonconformance to any requirements of this specification shall be cause for rejection.

4.5.7 Lifting from top corners. Conformance to 3.4.1.9 shall be verified by conducting the top corner lifting test described in ISO 1496-1 on a 20-foot module and on an individual Tricon 5 and measuring deflection of the base. Deflection of the base that exceeds 1 inch (25.4 mm) below the plane formed by the bottom faces of the bottom corner fittings, and permanent deformation, dislocation, damage to or failure of the containers or connectors shall constitute failure of this test.

4.5.8 Lifting from bottom corners. Conformance to 3.4.1.10 shall be verified by conducting the bottom corner lifting test described in ISO 1496-1 on a 20-foot module. Nonconformance to requirements stated in ISO 1496-1 for condition of the container after performing the test shall constitute failure of this test.

MIL-PRF-32402

4.5.9 Container strength. Conformance to 3.4.1.11 shall be verified by conducting the following tests as specified in ISO 1496-1:

- a. longitudinal restraint
- b. transverse rigidity
- c. longitudinal rigidity
- d. lifting from forklift pockets

Failure to conform to requirements stated in ISO 1496-1 for container condition after test completion for each respective test shall constitute failure of the corresponding test.

4.5.10 Shoring slots. A 1-5/8 inches (41.275 mm) wide, rigid metal bar is to be inserted in each pair of shoring slot supports so that it runs transversely across the Tricon 5 between the two supports. Loading equal to 0.6 times the payload of an individual Tricon 5 container (P_g in ISO 1496-1) is to be distributed across the middle 915 mm (3 ft) of the bar such that the load is applied horizontally towards the Tricon 5's doors. The doors shall be fully opened during this test. This load shall be maintained on the bar for at least 2 minutes. Nonconformance to 3.4.1.14 shall constitute failure of this test.

4.5.11 Shelf decking beams. The shelf decking beams shall meet the working load capacity as specified in 3.4.1.16.1. A 3/4-inch (19.05 mm) shelf shall be used for the purpose of conducting this test. The shelf shall span the entire length and width of the Tricon 5 interior. Install the first 3/4-inch (19.05 mm) plywood shelf at 2 ft \pm 2 inches (609.6 \pm 50.8 mm) from the floor of the Tricon 5, and then install three subsequent 3/4-inch (19.05 mm) plywood shelves equally spaced every 16 inches (406.4 mm) above the initial shelf. Uniformly load and secure each shelf with not less than 2,000 pounds (907 kg). The load shall remain on each shelf for all drop tests. Close the Tricon 5 doors and center a nominal 4 inches (101.6 mm) by 4 inches (101.6 mm) piece of lumber under the bottom rail of the door end of the Tricon 5. Raise the opposite side of the Tricon 5 to a height of 12 (+3/4, -1/4) inches (304.8 (+19.05, -6.35) mm) and then allow it to fall freely onto a concrete surface using the 4 inches (101.6 mm) by 4 inches (101.6 mm) piece of timber as a pivot. As a minimum, the Tricon 5 lift height shall be measured at each corner of the Tricon 5. The same procedures shall be completed for each of the sides of a Tricon 5; with the raised side always on the side opposite the timber. Lift the entire Tricon 5 12 (+3/4, -1/4) inches (304.8 (+19.05, -6.35) mm) and then allow the Tricon 5 to fall freely onto a flat concrete surface. Following completion of each individual test, the Tricon 5 and shelves shall be inspected. Permanent deformation, dislocation, damage to, and/or failure of the E or A vertical logistic tracks, welds, shelf decking beams, or related components shall be cause for rejection. Nonconformance to 3.4.1.15 through 3.4.1.16.1 shall constitute failure of this test.

4.5.12 Tie downs. To verify conformance to 3.4.1.17, an interface test shall be conducted on each type of tie down provision using a hook with minimum dimensions as specified on figure 7. Inability of the hook to fully engage with the tie down provision, blocking or restricting movement of the hook by the container wall or post, restriction of strapping adjustment, and tearing or other damage to the strapping shall constitute failure of this test.

MIL-PRF-32402

4.5.13 Top and bottom rail tie down load rating. Conformance to 3.4.1.17.1.2 shall be verified as follows:

- a. A load of 6,000 pounds shall be applied statically and independently at an angle of 45-degrees from the horizontal and 45 degrees from the vertical, and shall be conducted on each tie down provision; and each tie down provision may be tested individually.
- b. The 6,000 pound load shall be applied statically and independently for not less than 6.0 seconds.
- c. The points used to apply the load to the tie down shall be located so they do not interfere with or reduce the loading on the structural member next to the tie down provisions.

Loads applied to each tie down provision shall be measured with an appropriate measuring device, such as a load cell. Failure of the tie down provisions to perform as specified in 3.4.1.17.1.2 shall constitute failure of this test.

4.5.14 Corner post and shoring slot tie down load rating. Conformance to 3.4.1.17.2.2 shall be verified as follows:

- a. A load of 6,000 pounds shall be applied statically and independently at an angle of 45 degrees from the horizontal and 45 degrees from the vertical, and shall be conducted on each tie down provision; and each tie down provision may be tested individually.
- b. The 6,000 pound load shall be applied statically and independently for not less than 6.0 seconds.
- c. The points used to apply the load to the tie down shall be located so they do not interfere with or reduce the loading on the structural member next to the tie down provisions.

Loads applied to each tie down provision shall be measured with an appropriate measuring device, such as a load cell. Failure of the tie down provisions to perform as specified in 3.4.1.17.2.2 shall constitute failure of this test.

4.5.15 Recessed floor tie down load rating. Conformance to 3.4.1.17.3.2 shall be verified as follows:

- a. A load of 6,000 pounds shall be applied statically and independently at an angle of 45-degrees from the horizontal and 45 degrees from the vertical, and shall be conducted on each tie down provision; and each tie down provision may be tested individually.
- b. The 6,000 pound load shall be applied statically and independently for not less than 6.0 seconds.

MIL-PRF-32402

- c. The points used to apply the load to the tie down shall be located so they do not interfere with or reduce the loading on the structural member next to the tie down provisions.

Loads applied to each tie down provision shall be measured with an appropriate measuring device, such as a load cell. Failure of the tie down provisions to perform as specified in 3.4.1.17.3.2 shall constitute failure of this test.

4.5.16 Weatherproofness test. Conformance to 3.5.2 and the self draining requirement of 3.4.1.8.2 shall be verified by performing the ISO 1496-1 weatherproofness test with the container level to within 5 degrees. The weatherproofness test shall be completed after all other required ISO 1496-1 tests have been completed. Nonconformance to 3.5.2 and 3.4.1.8.2 shall constitute failure of this test.

4.5.17 Tricon 5 coupling and uncoupling. Conformance to 3.6.4 shall be verified by demonstration. Three Tricon 5 containers shall be coupled with their supplied connectors in the locked position to form an integral 20-foot module in not more than 30 minutes. A maximum of one forklift truck shall be used to position and assist in the connection of the Tricon 5s to form an ISO equivalent 20-foot module. The Tricon 5s shall be uncoupled, after being lifted, in not more than 30 minutes with one forklift truck. The connecting couplers shall be returned to their original storage area in each Tricon 5 container during the 30 minutes.

4.5.18 Container stacking. Conformance to 3.6.5.1 shall be verified by conducting the ISO 1496-1 container stacking test using the following loading conditions:

- a. test force per container, represented by three Tricon 5s coupled together, on all four corners simultaneously shall be 3,767 kN (846,855.3 lbf)
- b. test force per pair of end fittings shall be 1,883 kN (423,315.2 lbf)
- c. superimposed mass represented by the test force shall be 213,360 kg (470,380 lb)

Failure to conform to requirements stated in ISO 1496-1 for container condition after test completion shall constitute failure of this test.

5. PACKAGING

5.1 Packaging. For acquisition purposes, the packaging requirements shall be as specified in the contract or order (see 6.2). When packaging of materiel is to be performed by DoD or in-house contractor personnel, these personnel need to contact the responsible packaging activity to ascertain packaging requirements. Packaging requirements are maintained by the Inventory Control Point's packaging activities within the Military Service or Defense Agency, or within the military service's system commands. Packaging data retrieval is available from the managing Military Department's or Defense Agency's automated packaging files, CD-ROM products, or by contacting the responsible packaging activity.

MIL-PRF-32402

6. NOTES

(This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.)

6.1 Intended use. The Tricon 5 covered by this specification is intended for the storage, transportation and distribution of dry cargo. These Tricon 5s are based on commercial designs and manufactured using commercial processes. They are further modified for military unique requirements which are identified within this specification for operation in an extreme environment, under conditions typically found in military operations. Military unique requirements include, but are not limited to the following: NBC survivability; military tie downs, corrosion resistance; storage and transit in temperatures from -60 °F (-51 °C) to +160 °F (+71.1 °C); internally air transportable by a variety of military aircraft; and externally air transportable from a CH-47 helicopter by sling. Further military unique modifications to Tricon 5s may include, but are not limited to the following: field petroleum systems; field hygiene systems; command and control posts; and chapels. Army users should contact the Tank-automotive and Armaments Command (TACOM) Natick Integrated Logistics Support Center (ILSC) - AMSTA-LC-CESI, (508) 233-6002 for Tricon 5 ordering requirements. Other services may also contact the TACOM ILSC for Tricon 5 ordering requirements. CARC Green 383, color number 34094 of FED-STD-595 is the default paint requirement for the Tricon 5 described within this specification, and the NSN for this Tricon 5 is 8150-01-609-6513. Other NSNs are available for ordering CARC and additional interior and exterior colors for Tricon 5s manufactured to this specification (see 6.2 and table VI). Contact the Natick ILSC for further guidance and ordering.

6.2 Acquisition requirements. Acquisition documents should specify the following:

- a. Title, number, and date of this publication.
- b. If required, the specific issue of individual documents referenced (see 2.2.1 and 2.3).
- c. When first article testing is required (see 3.1 and 4.2).
- d. Tricon 5 variant (see 6.9)
- e. When CARC is required (see 3.3.2).
- f. Exterior color (see 3.3.2.3 and 3.3.3.3).
- g. Interior color (see 3.3.2.3 and 3.3.3.3).
- h. When non-CARC paint is required (see 3.3.3).
- i. When undercoating is specified (see 3.3.4).
- j. When locking bar and security seal or cable is specified (see 3.4.1.13).
- k. When a Type P01 captive padlock conforming to ASTM F833 with two keys is specified (see 3.4.1.13).
- l. When additional shelf decking beams are required (see 3.4.1.16.1).
- m. When a Type 5 Tricon with 1 shelf is specified (see 3.4.1.16.3).
- n. When a Type 5 Tricon with 2 shelves is specified (see 3.4.1.16.4).
- o. When opening and closing vents are specified (see 3.4.1.18).
- p. When manifest boxes are required (see 3.4.1.19).
- q. When rack and cabinet systems are required (see 3.4.1.20).

MIL-PRF-32402

- r. When serial numbers are specified (see 3.8.1).
- s. Location of optional markings (see 3.8.1).
- t. Packaging requirements (see 5.1).

6.3 First article inspection. When a first article inspection is required, the item(s) should be a first article production unit. The contracting officer should include specific instructions in acquisitions' documents regarding arrangements for examinations, approval of the first article test results, and disposition of the first article(s).

6.4 Corrosion control methods. Corrosion control can be achieved by a combination of design features as in TACOM Design Guidelines for Prevention of Corrosion in Combat and Tactical Vehicles, March 1988, material selection (e.g. composites, corrosion resistant metal, galvanized steel), organic or inorganic coatings (e.g. zinc phosphate pre-treatment, corrosion resistant plating, E-coat, powder coating) and production techniques (e.g. coil coating, process controls, inspection and documentation). To obtain high level of corrosion resistance/paint adhesion, the manufacturer may want to consider the use of new high performance, "Combat Grade" Powder Coat Primers. These primers can only be applied by approved applicators. The Specification controlling both the primers and their application are available upon request from the U.S. Army Tank Automotive Research, Development and Engineering Center (TARDEC), by emailing usarmy.detroit.rdecom.mbx.tardec-standardization@mail.mil.

6.5 Series E and A vertical logistic tracks. Series E and A vertical logistic tracks are available from, but not limited to, the suggested sources identified below:

ANCRA International, Eastern Region
3300 Turfway Road, Suite 110
Erlanger, KY 48018
Phone (800) 233-5138
Facsimile (800) 347-2627

Kinedyne Corporation
3701 Greenway Circle
Lawrence, KS 66046-5442
Point of Contact: Mr. Joe Takacs
Phone (785) 841-4000

6.6 Loop tie down hooks and web assemblies. Web assembly NSN 3990-01-204-3009 with hooks that meet tie down interface requirements is available from, but not limited to, the suggested sources identified below:

Davis Aircraft Products Co., Inc.
1150 Walnut Avenue
Bohemia, NY 11716
Phone (631) 563-1500
Facsimile (631) 563-1117

MIL-PRF-32402

ANCRA International LLC
4880 W. Rosecrans Ave.
Horthorne, CA 90250-6614

Facsimile (785) 841-3668

6.7 Locking bar and security seal or cable. When specified (see 6.2) locking bars with security seals or cables are available from, but not limited to, the suggested sources identified below:

American Seals
P.O. Box 841003
Pembroke Pines, FL 33084
Phone (954) 438-8323
Facsimile (954) 438-8077

PJ Murray Associates, Inc.
P.O. Box 472627
Charlotte, NC 28247
Phone (704) 844-8600
Facsimile (704) 849-9197

6.8 Disclaimer. Reference herein to any specific commercial company, product, process, or service by trade name, trademark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or the Department of the Army, and will not be used for advertising or product endorsement purposes.

6.9 Tricon 5 variations. Tricon 5s are available in the variations shown in table VI (see 6.2).

MIL-PRF-32402

TABLE VI. Tricon 5 Variations (with and without shelves).

Tricon Type	Color	Finish	Part #	# of Shelves	NSN	Shelving Description
Type 5	Green 383, or other color as specified (see 6.2).	Non-CARC	5-13-9842-5	None	8150-01-609-6513	No shelves.
Type 5	Green 383, or other color as specified (see 6.2).	Non-CARC	5-13-9842-5-1S	1 shelf	8150-01-609-6531	A Type 5 Tricon with 1 shelf includes one longitudinal full shelf consisting of two pieces each measuring a minimum of 64.50 inches long by 46.50 inches wide by 1 inch thick. A minimum of three (3) decking and shoring beams are included with this shelf system (see 3.4.1.16.3 and 6.2).
Type 5	Green 383, or other color as specified (see 6.2).	Non-CARC	5-13-9842-5-2S	2 shelves	8150-01-609-6536	A Type 5 Tricon with 2 shelves includes two longitudinal full shelves consisting of 4 pieces each measuring a minimum of 64.50 inches long by 46.50 inches wide by 1 inch thick. Each full shelf consists of 2 pieces and a minimum of three (3) decking and shoring beams, and therefore a minimum of six (6) decking and shoring beams are included with this shelf system (see 3.4.1.16.4 and 6.2).

MIL-PRF-32402

TABLE VI. Tricon 5 Variations (with and without shelves) - continued.

Tricon Type	Color	Finish	Part #	# of Shelves	NSN	Shelving Description
Type 5	Green 383, or other color as specified (see 6.2).	CARC	5-13-9842-6	None	8150-01-609-6513	No shelves.
Type 5	Green 383, or other color as specified (see 6.2).	CARC	5-13-9842-6-1S	1 shelf	8150-01-609-6531	A Type 5 Tricon with 1 shelf includes one longitudinal full shelf consisting of two pieces each measuring a minimum of 64.50 inches long by 46.50 inches wide by 1 inch thick. A minimum of three (3) decking and shoring beams are included with this shelf system (see 3.4.1.16.3 and 6.2).
Type 5	Green 383, or other color as specified (see 6.2).	CARC	5-13-9842-6-2S	2 shelves	8150-01-609-6536	A Type 5 Tricon with 2 shelves includes two longitudinal full shelves consisting of 4 pieces each measuring a minimum of 64.50 inches long by 46.50 inches wide by 1 inch thick. Each full shelf consists of 2 pieces and a minimum of three (3) decking and shoring beams, and therefore a minimum of six (6) decking and shoring beams are included with this shelf system (see 3.4.1.16.4 and 6.2).

MIL-PRF-32402

6.10 Definitions.

6.10.1 Dissimilar metals. For its purpose, this document considers metals dissimilar when two specimens in contact with each other promote accelerated galvanic corrosion (see 3.2.1).

6.10.2 Recovered materials. For the purpose of this document, recovered materials are those materials that have been collected from solid waste and reprocessed to become a source of raw materials, as distinguished from virgin raw materials (see 3.2.2).

6.10.3 Tricon 5. A Tricon 5 is a rigid metal container which measures 6 ft 5-1/2 inches long by 8 ft high by 8 ft wide (1968 mm by 2438 mm by 2438 mm) (external measurements). Three Tricon 5s coupled and locked together at their corner fittings form a 19 ft 10.5 inches by 8 ft by 8 ft (6058 millimeters (mm) by 2438 mm by 2438 mm) ISO compliant container. Tricon is an abbreviation of and originates from the words triple and container combined together.

6.10.4 Owner code. The owner code consists of three capital letters of the Latin alphabet such as USA for United States Army, to indicate the owner or principal operator of the container. This code needs to be registered at the Bureau International des Containers in Paris to ensure uniqueness world-wide. The code must be supplied to the contractor by the United States Army.

6.10.5 Equipment category identifier. A capital letter from the Latin alphabet that identifies the equipment category.

6.10.6 Serial Number. The serial number consists of 6 (Arabic) numeric digits, assigned by the owner or operator, uniquely identifying the container within that owner/operators fleet.

6.10.7 Check Digit. The check digit consists of one (Arabic) numeric digit that follows the serial number, and provides a means of validating the recording and transmission accuracies of the owner code and serial number.

6.11 Subject term (key word) listing.

Connecting couplers
Corner fittings
Corner post
End walls
Forklift pockets
Shoring slot
Side walls

MIL-PRF-32402

NOTES:

1. See 3.4.1.14, 3.4.1.17, 3.4.1.17.1 and 3.4.1.17.2 for more detail.
2. Tricon 5 (40) total tie downs on walls plus (8) recessed tie downs in floor.
3. Tie downs shall be positioned as close as possible to the innermost face of the side wall sections without intruding into the usable cargo area. Locations shown are approximate.
