**PERFORMANCE SPECIFICATION
VECTOR PRODUCT INTERIM TERRAIN DATA (VITD)**

**This specification is approved for use by all
Departments and Agencies of the Department of Defense.**

1. SCOPE

1.1 Scope. This specification defines the content and format requirements of the Defense Mapping Agency's (DMA) Interim Terrain Data (ITD) product in the Vector Product Format (VPF). This product will replace the current ITD for users requiring this data on Compact Disc - Read Only Memory (CD-ROM). The data base from which VITD is produced is referred to as the Terrain Analysis Data Set (TADS).

1.2 Purpose. The purpose of this specification is to assure uniformity of treatment among all mapping and charting elements engaged in a coordinated production program for this product. VITD is a vector-based digital product that portrays selected military geographic information containing features of tactical military significance in a standardized georelational structure. VITD is designed to support tactical military and Geographic Information System (GIS) applications for selected geographic areas.

1.3 Classification. The VITD is primarily based on the feature content of the ITD (MIL-I-89014) produced by DMA. In turn, the ITD is based on the content and feature definitions contained

Beneficial comments (recommendations, additions, deletions) and any pertinent data which may be of use in improving this document should be addressed to: Director, Defense Mapping Agency, ATTN: ATC, ST A-13, 8613 Lee Highway, Fairfax, VA 22031-2137, by using the Standardization Document Improvement Proposal (DD Form 1426) appearing at the end of this document or by letter.

**DISTRIBUTION STATEMENT A. Approved for public release;
distribution is unlimited.**

MIL-PRF-89040A

in DMA's Tactical Terrain Analysis Data Base (TTADB) (MIL-T-89304). Sources used in the compilation of this product may include information derived from aerial photography, topographic maps, soil surveys, hydrographic studies, land use inventories, and transportation reports. Information may have been derived from hardcopy TTADBs at a scale of 1:50,000 or conversion from ITD in Standard Linear Format (SLF). VITD, ITD, and TTADB are all individually organized into single subject thematic overlays, files, or layers/coverages consisting of Surface Configuration (Slope), Vegetation, Surface Materials (Soils), Surface Drainage, Transportation (ITD and VITD have enhanced road networks), and Obstacles. Thus, VITD feature and attribute content is consistent with associated hardcopy TTADB products. These products cover only selected areas of the world.

2. APPLICABLE DOCUMENTS

2.1 General. The documents listed in this section are specified in sections 3 and 4 of this specification. This section does not include documents cited in other sections of this specification or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements documents cited in sections 3 and 4 of this specification, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those listed in the current Department of Defense Index of Specifications and Standards (DoDISS) and the supplement thereto, cited in the solicitation (see 6.2).

(Unless otherwise indicated, copies of the above specifications, standards, and handbooks are available from the Standardization Documents Order Desk, Building. 4D, 700 Robbins Avenue, Philadelphia, PA 19111-5094).

2.2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this document to the extent specified herein. Unless otherwise specified, the issues are those cited in the solicitation.

- a. DMA Technical Manual (DMA TM) 8358.1 - Datums, Ellipsoids, Grids, and Grid Reference Systems. (Stock Number DMATM83581TEXT)
- b. DMA Technical Report (DMA TR) 8350.2 - Department of Defense World Geodetic Systems, 1984. (Stock Number DMATR83502WGS84)

(Copies of a. and b. above are available from the Defense Mapping Agency, Consumer Interface (OCI), 6001 MacArthur Boulevard, Bethesda, MD 20816-5001.)

MIL-PRF-89040A

- c. Digital Geographic Information Exchange Standard (DIGEST), Part 4, Feature and Attribute Coding Catalogue (FACC).
- d. DMA Procedural Instruction (PI) 813-102, Guidelines for Labeling The Defense Mapping Agency's CD-ROMs, and Printing and Finishing of Jewel Case Liners/Cardboard Sleeves, and Information Booklet.

(Application for copies of c. and d. should be addressed to: Director, Defense Mapping Agency, ATTN: ATI, 8613 Lee Highway, Fairfax, VA 22031-2137.)

2.3 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of the documents which are DoD adopted are those listed in the issue of the DoDISS cited in the solicitation. Unless otherwise specified, the issues of documents not listed in the DoDISS are the issues of the documents cited in the solicitation (see 6.2).

- a. ANSI/IEEE 754-1985. IEEE Standard for Binary Floating Point Arithmetic.

(Application for copies should be addressed to the publisher: IEEE, Inc., 345 East 47th St., NY, 10017.)

- b. ISO 9660. 1988 (E). International Organization for Standardization Information Processing-Volume and File Structure of CD-ROM for Information Interchange.

(Application for copies should be addressed to the American National Standards Institute, 1430 Broadway, New York, NY 10018.)

2.4 Order of precedence. In the event of a conflict between the text of this document and the references cited herein (except for related associated specifications, specification sheets, or MS standards), the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. REQUIREMENTS

3.1 First article. When specified (see 6.2), a sample shall be subjected to first article inspection in accordance with 4.2.

3.2 Accuracy.

3.2.1 Horizontal accuracy. A formal horizontal accuracy for VITD has not been defined by the users of this product.

3.2.2 Vertical accuracy. A formal vertical accuracy for VITD has not been defined by the users of this product.

MIL-PRF-89040A

3.2.3 Relative accuracy. A formal relative accuracy for VITD has not been defined by the users of this product

3.3 Datum.

3.3.1 Horizontal datum. The horizontal datum shall be referenced to WGS84. If the source map sheets are not referenced to WGS84, then they will be converted from their original horizontal datum to WGS84.

3.3.2 Vertical datum. Vertical datum shall be Mean Sea Level.

3.4 Security.

3.4.1 Security classification. The security classification of the products generated by the use of these specifications will be the lowest category practicable. When it is necessary to assign a security classification to the product, it shall be in accordance with established national security procedures.

3.4.2 Security classification of product. CD-ROM discs containing the VITD data vary in classification depending on the geographic location covered by the data. The CD-ROM will carry the classification of the most restrictive classification of any library contained within that particular compact disc. (TBR)

3.4.3 Security classification of specification. This performance specification is UNCLASSIFIED.

3.5 Continuity. Both the VITD product and TADS database consist of multiple libraries, each library contains the equivalent size of the associated ITD cell, which may cover the general geographic extent of the older TTADB hardcopy overlays. No data overlap should exist in the libraries. Features crossing library boundaries will match as well as the currency of the source material or method of data collection permits. In some cases older cells may not match more recently compiled cells. All VITD/TADS data is subject to the inclusion conditions as stated in Appendix A, Section 6.

3.6 Thematic layer organization. The VITD product and TADS database are organized into thematic layers. Each thematic layer is stored as a single coverage. The CCXXXXXX library each contains six thematic layers (coverages), (see TABLE 1).

3.7 Units of measure. Units of measurement in this product specification are given in the metric system. Actual units of measurement for specific attribute categories are defined in Appendix A, Section 6. Primary units are meters, decimeters, and centimeters.

3.8 VITD/TADS feature and attribute coding scheme. Both the VITD product and TADS database utilize the Digital Geographic

MIL-PRF-89040A

TABLE 1. Thematic layers for CCXXXXXX library.

CCXXXXXX ¹ library thematic layers	Coverage name
Obstacles	OBS
Slope/Surface Configuration	SLP
Soil/Surface Materials	SMC
Surface Drainage	SDR
Transportation	TRN
Vegetation	VEG

NOTE:

1. Representative name for which CC represents a country code and XXXXXX represents ITD cell code, e.g., USW64462.

Information Standard (DIGEST), Part 4, Feature and Attribute Coding Catalogue (FACC) to define features, attributes, and attribute values. See Appendix A, Section 6, for a listing of the feature codes, attribute codes, and attribute values allowable for VITD and TADS thematic files.

3.8.1 Unknown, not applicable, and null values. In cases where FACC does not assign an unknown or null attribute value, and one is required to populate a field, refer to Attribute Format Table in Appendix A, Section 7, for the appropriate unknown and null value for the attribute column.

3.8.2 Unknown value condition.

a. The FACC system supports the use of an attribute value which signifies an "unknown" condition. Generally, with few exceptions, FACC implements a value of "0" to represent an unknown data condition for integer values. For text data types of fixed length, the character string "UNK" is entered with the appropriate blank-fill. For text data types of variable length, the character string "UNK" is entered.

b. During data capture, it may not be possible to determine the value of an attribute using the inclusion conditions or collateral data sources. When FACC provides an attribute value to support the "unknown" condition, it must be used. In cases where the "0" value is already used to represent a valid number, an alternative value is needed to represent the unknown condition. These values may be found in Appendix A, Section 6.

c. The following criteria shall be used to implement unknown values not defined in the FACC catalog:

(1) When an "Unknown" value is needed for an attribute and the value "0" is not already used to represent a numeric or other alphanumeric value, then the attribute value "0" will be assigned to represent the attribute definition "Unknown."

MIL-PRF-89040A

(2) If the value "0" is already used to represent another definition, then the range of all positive values should be evaluated and the highest necessary positive value should be used to represent the "Unknown" condition that is composed of all 9s. The standard value used in this specification is 999, which is implemented for DMT Density Measure-Trees and SGC Gradient/Slope attribute categories.

3.8.3 Null value conditions.

a. Some feature classes may have attribute columns present in the feature table that are defined for some features, but not others. In this case a null value is entered for those attribute values when they do not apply to the feature code. The null value will be present in a field when an attribute column is not defined for a feature code.

b. In general, the value -MAXINT, maximum negative integer, is used to represent a null value for integer. For text data types such as the attribute, Text Attribute, the variable length text will have zero length for a null value. For a more thorough description refer to MIL-STD-2407, section 5.5.

3.9 Coordinate system. VITD/TADS data shall be stored in decimal degrees as geographic coordinates. The horizontal resolution for the geographic coordinates shall be stored to the equivalent precision of 0.01 arc-seconds or 0.000002 decimal degrees.

3.10 Data format. VITD and TADS will be produced in Vector Product Format (VPF), which provides a standard format for storing digital vector cartographic data. Refer to the VPF Military Standard (MIL-STD-2407) for more detail on VPF format and structure. This specification, MIL-PRF-89040A, provides guidance for the specific implementation of VITD and TADS in VPF.

3.11 Database description. The TADS database is a vector-based product implemented in VPF. This product is designed to support specialized military GIS applications at a tactical level. Data at this resolution are separated into six thematic layers, where each layer contains a thematically consistent grouping (see TABLE 1). Each coverage contains a set of files that describe and locate the features in that thematic layer.

3.11.1 File structure. TADS data shall utilize the standard Disk Operating System (DOS) directory structure as specified in the VPF DoD Standard, MIL-STD-2407.

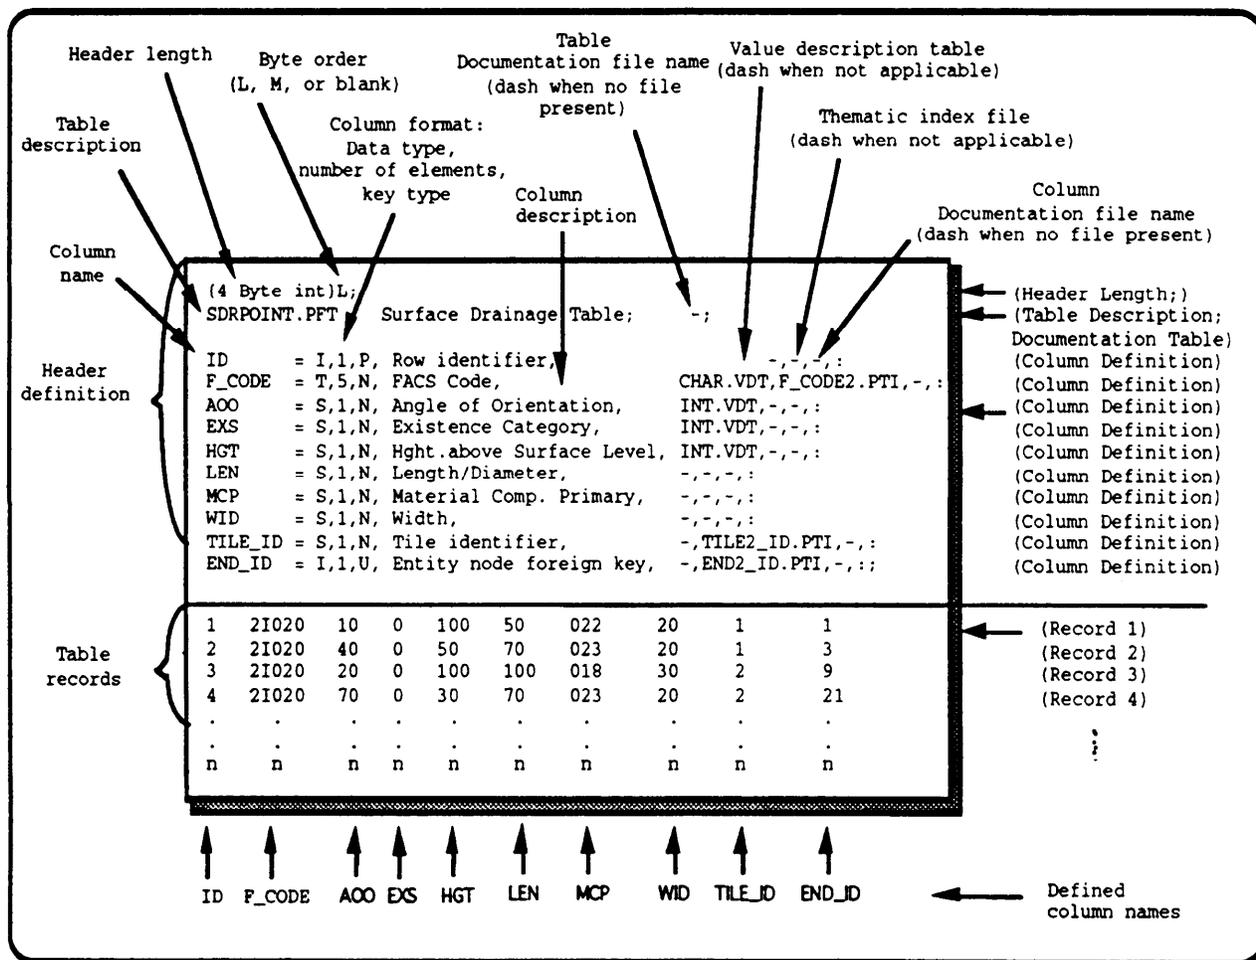

3.11.2 Distribution medium. TADS (and VITD) will be distributed on CD-ROM disc implementing ISO 9660 for CD-ROM formatting. Multiple libraries may exist on one CD-ROM.

MIL-PRF-89040A

3.12 VPF table and file structure. Three types of VPF files are implemented in the TADS database: directories, tables, and indexes.

3.12.1 Directories. All TADS database files are contained in a hierarchy of system-level directories in accordance with MIL-STD-2407. Contained within these directories are the tables and indexes that provide information about the database.

3.12.2 VPF tables. Each directory within a TADS database contains VPF tables. A VPF table consists of two parts: (1) a header and (2) data records. See FIGURE 1.

**NOTES:**

1. The VPF tables defined in this specification shall include all columns specified.
2. Spaces are not a part of the header and are shown for clarity, TADS is untiled, and primitive IDs follow directly after the feature IDs.

FIGURE 1. Illustration of a VPF table.

(This is an approximated example of feature table.)

MIL-PRF-89040A

3.12.2.1 Header.

a. The header of a VPF table defines the table contents, including the column names, column format, and descriptive information. Since all VPF tables are attribute tables, any VPF table may be extended to include additional attribute columns to further describe the characteristics of a database.

b. Each table header is divided into four sections: header length, table description, documentation (or narrative) file name, and the column information that is repeated for each column in the table. A semicolon signifies the end of each header section.

c. The first section contains the header length in bytes, represented as the total length minus the first four bytes that store the header length. This value is immediately followed by a byte order designator, which for TADS is least-significant first and shall be represented by L.

d. The second section provides a textual description of the VPF table contents. A description must be present.

e. The third section defines an optional documentation file for the table. When a documentation file is not applicable to the table, the section will contain a dash character (-).

f. The fourth section contains an entry for each column defined in the table. Entries in this section are delimited by an equal sign (=) or comma (,). The end of each column definition is denoted by a colon (:).

g. The column information is composed of eight entries that are repeated for each column defined for the table. These entries include: column name, data type, number of elements in field, key type, column description, an optional value description table, an optional thematic index name, and an optional documentation file for the column. When a value description table, index file, or documentation table is not present, the field must contain a dash (-). The last column defined in a header must terminate with a colon followed by a semicolon.

h. TABLE 2 provides a description of the format of each entry for a column definition. The spaces depicted in FIGURE 1 are not incorporated into the VPF header, and are shown only for clarity.

3.12.2.2 Column format. The column format provides the field definition for each attribute column of a VPF table. A column format contains three types of information found in the header of the table: the data type, the number of elements (or count), and the key type.

MIL-PRF-89040A

TABLE 2. Schema for VPF header structure.

Header Field	Description	Field Type and Size
Header length	The length in bytes of the ASCII header text string	I,1
Byte order	Byte order in which table is written: L - least-significant first (semicolon separator)	T,1 T,1
Table description	Textual description of table (semicolon separator)	T,n (n<=80) T,1
Documentation (Narrative) file name	Name of optional file with additional descriptive information about the related table (semicolon separator)	T,n (n<=12) T,1
Column definition	<i>The following fields repeat for each column defined in the table</i>	
Column name	The name of the column (equal sign separator)	T,n (n<=16) T,1
Data type	The data type of the field (comma separator)	T,1 T,1
Number of elements ¹	The number of elements in the field (comma separator)	T,n (n<=3) T,1
Key type	The type of key (comma separator)	T,1 T,1
Column description	Textual description of the column name or meaning (comma separator)	T,n (n<=80) T,1
Value description table name	Name of an optional VDT that relates to the table (comma separator)	T,n (n<=12) T,1
Thematic index file	Name of optional thematic index (comma separator)	T,n (n<=12) T,1
Documentation (narrative) file name	Name of optional documentation file with additional descriptive information about the column or attribute (comma separator)	T,n (n<=12) T,1
End of column	(colon separator) (repeat for each column)	T,1
End of header	(semicolon separator)	T,1

NOTE:

1. This field contains the number of occurrences of the data type specified, not the number of bytes. For example, if there is only one integer value in the field, the header will contain the number "1" in that field. For text fields only, the value indicates the maximum number of bytes allowed for that column. For example, if a maximum of 12 characters are allowed in the field, then the number of elements is specified as "12". The number of bytes specified for a particular text field are shown in subsequent tables in this specification.

MIL-PRF-89040A

3.12.2.2.1 Data type. The data type is represented by a single character that depicts how the data for that column are stored (e.g., I for long integer, T for text). The data types permitted in the TADS database are depicted in TABLE 3.

3.12.2.2.2 Number of elements. The second value of a field definition represents the number of occurrences of the specified data type in the field. It does not reflect the size of the field in bytes. The number of elements can be translated to bytes using TABLE 3. For example, one count or element of a short integer is 2 bytes.

TABLE 3. Data types permitted in the TADS database.

Data Type	Description	Length in Bytes
I	Long integer	4
S	Short integer	2
F	Short floating point	4
T,n	Fixed-length text string	n
T,*	Variable-length text string	n+4
C,*	2-coordinate string	8n+4
C,n	2-coordinate array (short floating point)	8n
X	Null field	-
D	Date and time	20

3.12.2.2.3 Key type. The third character in the column definition is the key type. The "key type" column is represented by a single character that indicates whether a column is implemented as a primary key, unique key, or nonunique key (TABLE 4).

TABLE 4. Key types permitted in the TADS database.

Key Type	Description
P	Primary key
U	Unique key
N	Non-unique key

3.12.2.3 Data records. Following the header of every VPF table are one or more data rows (or records). Each row contains a set of fields or columns corresponding to the column definitions specified in the table header. (Columns can be of fixed-length or variable-length.) A row identifier, or ID, is required as the first column of every table record and contains sequential integers beginning with the number 1. Column values store the information pertaining to each defined column in each row. Rows can be fixed or variable-length as defined in the header. The column names in every TADS table are unique, and are defined by field type, count of elements, and key type.

MIL-PRF-89040A

3.12.3 Indices. The TADS product contains four types of index files: spatial index files, thematic index files, variable-length index files, and feature index tables. In the TADS product, tables that have an associated index file are all those with variable-length records; all primitive tables; all feature tables; and any metadata tables where a thematic index is defined.

3.12.3.1 Spatial index file.

a. Spatial indices will be defined for all primitive tables. The index is based on the value of the minimum bounding rectangle (MBR) for the face and edge primitive tables. For node primitives, the index is based on the coordinate column in the node primitive table. A spatial index provides the capability to use a set of coordinates to identify a primitive and its associated feature attributes. Spatial indexes are implemented for reduction of data access time for geographic coordinate queries of the TADS database.

b. The spatial indices are: FSI (face spatial index), ESI (edge spatial index), NSI (entity node spatial index), and CSI (connected node spatial index). The format of a VPF spatial index (TABLE 5) is a sequential file of data that is partitioned into three sections:

TABLE 5. Format for a spatial index (*SI) file.

Starting Position (Bytes)	No. of Bytes	Field Type	Description
0	4	Integer	Number of primitives
4	4	Float	Bounding rectangle x1
8	4	Float	Bounding rectangle y1
12	4	Float	Bounding rectangle x2
16	4	Float	Bounding rectangle y2
20	4	Integer	Number of nodes in index
HDR + n * 8	4	Integer	Offset of primitive list for node n
HDR + n * 8 + 4	4	Integer	Primitive count in integer units
HDR+BIN+os+c*8 + 0	1	Byte	Primitive bounding rectangle x1
HDR+BIN+os+c*8 + 1	1	Byte	Primitive bounding rectangle y1
HDR+BIN+os+c*8 + 2	1	Byte	Primitive bounding rectangle x2
HDR+BIN+os+c*8 + 3	1	Byte	Primitive bounding rectangle y2
HDR+BIN+os+c*8 + 4	4	Integer	Primitive ID

NOTES:

- HDR is the length of the index file header record.
Where: n ranges from 0 to the number of nodes minus 1
The variable c is {0 ... number of primitives for a node}; the value c for the first primitive is 0.
BIN is the summed length of all the bin array records.
os is the value of the offset variable in the corresponding bin array record.
- The bucket size of 8 shall be used for the creation of spatial indexes.

MIL-PRF-89040A

3.12.3.1.1 Header record. A header containing an integer defining the number of primitives, the bounding rectangle of the spatial extent of the library, and the number of nodes in the index.

3.12.3.1.2 Bin array record. This record is a two-dimensional array that is the length of the number of primitives defined in the header record. This array contains a long integer offset that points to the beginning of the bin data record and a long integer primitive count for each bin. The offset for the first bin always has a value of zero. For bins that contain no primitive, the value assigned to the count variable is zero and the offset value is undefined. By convention, the offset value of an empty bin points to the end of the data records for the previous bin.

3.12.3.1.3 Bin data record. This file contains the number of primitive records declared in the header. Each record contains four 1-byte integers defining the MBR for primitive and one long integer (4 bytes) for the primitive identifier (ID). These primitive IDs point into the associated primitive tables.

3.12.3.2 Thematic file index.

a. A thematic index file associates the feature code for each feature table to support efficient query response capabilities. The TADS database implements a thematic index on these columns for each point, line, area, and text feature table. Thematic indices are also carried for feature index tables and feature join tables. For the feature index table the feature class identifier (FC_ID), the primitive identifier (PRIM_ID), and feature identifier (FEA_ID) columns are indexed. For the join table the feature identifier (FEA_ID) and primitive identifier (PRIM_ID) columns are indexed.

b. The format of a VPF thematic index is a sequential data file (TABLE 6) that is partitioned into three sections:

3.12.3.2.1 Thematic index header. A fixed-length header of 60 bytes that specifies the associated feature table and the column within that table being indexed.

3.12.3.2.2 Index directory. A directory consisting of a repeating number of records for each distinct element being indexed. The number of entries is stored in the header record.

3.12.3.2.3 Index data.

a. A set of data records, one for each index entry consisting of row IDs from the table being indexed. For each index entry there exists a data record consisting of either a list of row IDs from the indexed file or bit array.

MIL-PRF-89040A

TABLE 6. Format for thematic index (*.TI) file.

Starting Position (Bytes)	No. of Bytes	Field Type	Description
0	4	Integer	Combined length of the index file header and index directory.
4	4	Integer	Number of directory entries. This is the number of items being indexed by a particular index file.
8	4	Integer	Number of rows in the data table being indexed.
12	1	Char	Type of index file ("I" for inverted list index).
13	1	Char	Type of data element being indexed: one of: I, T, or S.
14	4	Integer	Number of data elements comprising one directory entry (usually 1); except for a thematic index built on a text field.
18	1	Char	Type specifier for the data portion of the index file. Record IDs in inverted list index can be stored using either type "S" (2-byte integer) or type "I" (4-byte integer).
19	12	Char	Name of the VPF table being indexed with no path.
31	25	Char	Name of the column in the VPF table being indexed.
56	1	Char	Ordering flag ("S" indicates ascending order in the index directory).
57	3	Char	Unused.
60+n*(d+8)	d	Char Short float Integer Float Double	The element being indexed (the code value from the attribute column of the table being indexed).
60+n*(d+8)+d	4	Integer	The byte offset from the beginning of the file where the row of IDs associated with this index entry is located.
60+n*(d+8)+d+4	4	Integer	The number of indexed items associated with this entry.
os	-	-	Record IDs from the table being indexed.

LEGEND:

n ranges from 0 to number of index entries minus 1

d = size of (indexed type)

os = offset value at a given location (60+n*(d+8)+d)

MIL-PRF-89040A

b. Thematic indexes are contained within files having one of five suffixes: ATI (area thematic index), LTI (line thematic index), PTI (point or node thematic index), FTI (feature table index), and JTI (join table index).

3.12.3.3 Variable-length index file.

a. A variable-length index file is mandatory for all VPF tables containing variable-length text or variable-length coordinate fields. The index file specifies the starting position in bytes for variable-length text or coordinate records, and the length in bytes for each variable-length record in the table. This index is a separate file containing two parts, a header and a data array that specifies the byte offset from the beginning of the file for each record. Byte offset refers to a location with respect to the beginning of a file. The first byte of a file has an offset of zero. These indexes are implemented to permit direct data access for records having variable-length fields; direct access accelerates data retrieval. The format for a variable-length index file is presented in TABLE 7.

TABLE 7. Format for variable-length index (*.**X or **X) files.

Starting Position (Bytes)	No. of Bytes	Data Type	Description
0	4	Integer	Number of records (N) in table being indexed
4	4	Integer	Number of bytes in header of VPF table being indexed
8	8N	Integer	A two-dimensional array of N integers defined as: [n][0]=Byte offset from beginning of file [n][1]=Number of bytes in table record where n ranges from 1 to N

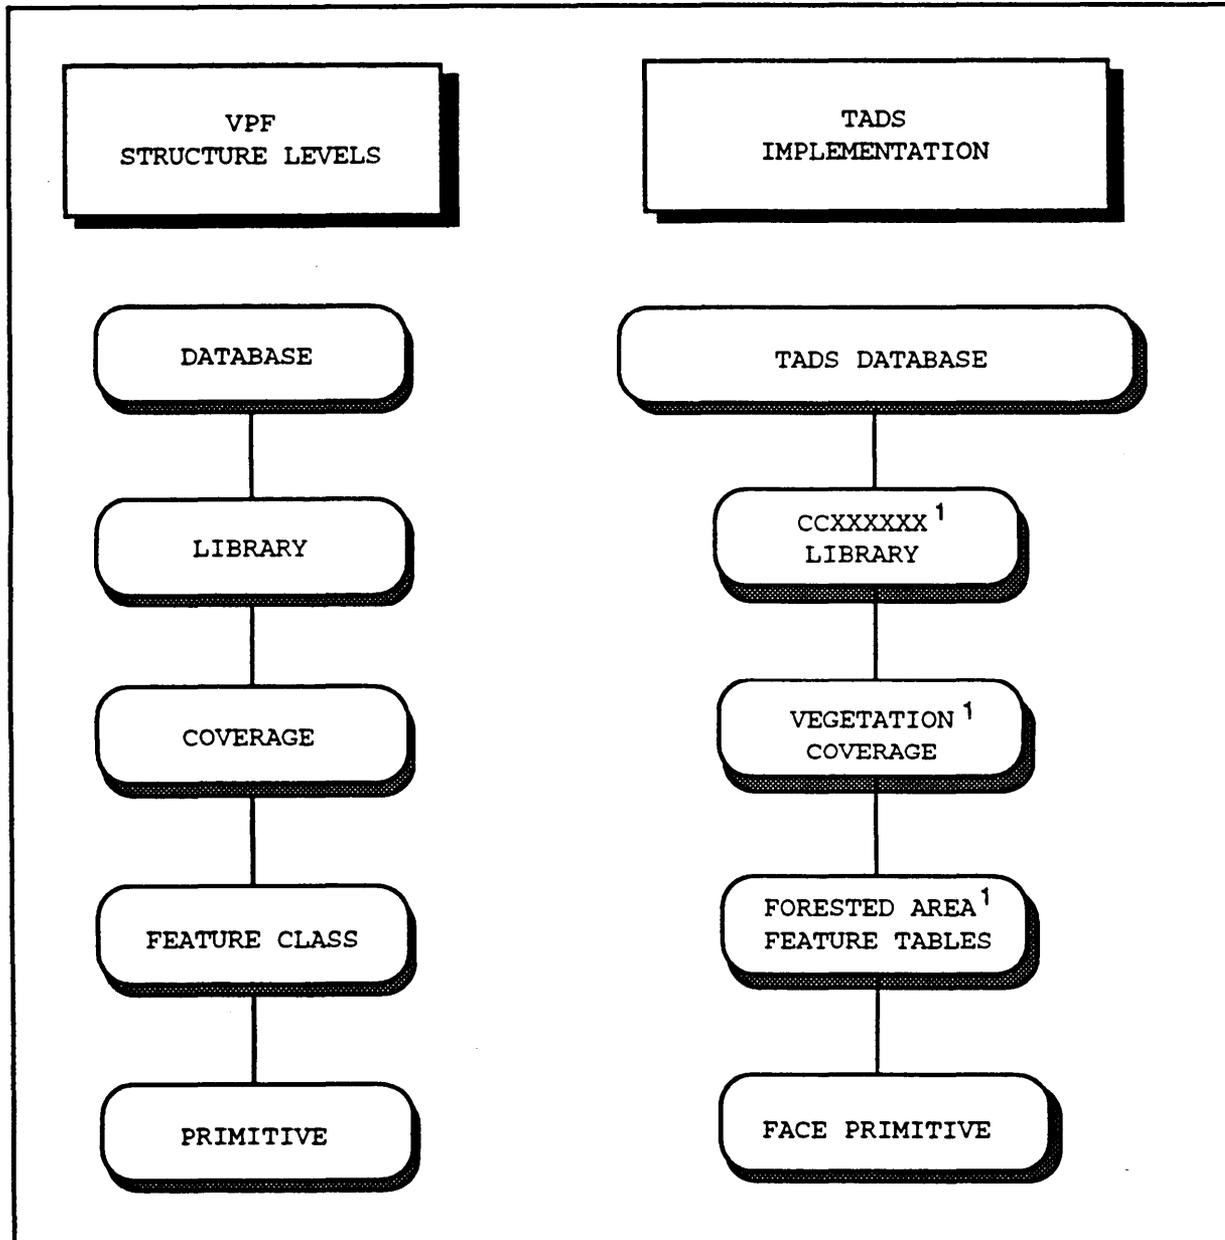

b. Variable-length index file names have a prefix that is the same as the VPF table prefix. The first two characters of the index file suffix are the first two characters of the VPF table suffix. The third character must be 'X'. The one exception to this convention is for the FCS, whose variable-length index shall be named FCZ.

3.12.3.4 Feature index table. A feature index table is implemented for TADS (refer to 3.14.4.1.3).

MIL-PRF-89040A

3.13 TADS directory organization.

3.13.1 Structure-level directories. TADS digital files are organized in directories that correspond to VPF structure levels (FIGURE 2). The directories representing VPF structure levels include database, library, coverage, and feature class.

**NOTE:**

- Names for example only

FIGURE 2. VPF structure levels and TADS implementation.

MIL-PRF-89040A

3.13.2 Library directories. Each TADS library directory may contain six thematic coverage directories (SLP, SMC, VEG, SDR, TRN, and OBS). Library directory names shall reflect the geographic extent of the library and will be provided to the producer as part of the source package.

3.14 VPF structure levels, tables, and files.

a. The following sections describe the tables and files present according to VPF structure level. The structure levels are presented as follows: database, library, coverage, feature class, and primitive. All directory names and file names shall be represented in lower case (most examples in this document are shown in capital letters). Each VPF directory contains files in the form of VPF tables and indices that provide information about the TADS database.

b. The record layout and content of the TADS VPF tables and files are described in Appendix A.

3.14.1 Database-level directory files. TADS contains one database directory. The TADS directory shall be present on each CD-ROM containing TADS libraries. The files contained in the TADS database level are described below. A representation of files appearing in the TADS database level are depicted in FIGURE 3.

3.14.1.1 Database metadata. The database directory contains two required VPF metadata tables. The required tables include the Library Attribute (or Extent) Table (LAT), and Database Header Table (DHT). (See TABLE 8.)

TABLE 8. TADS database-level table and file names and description.

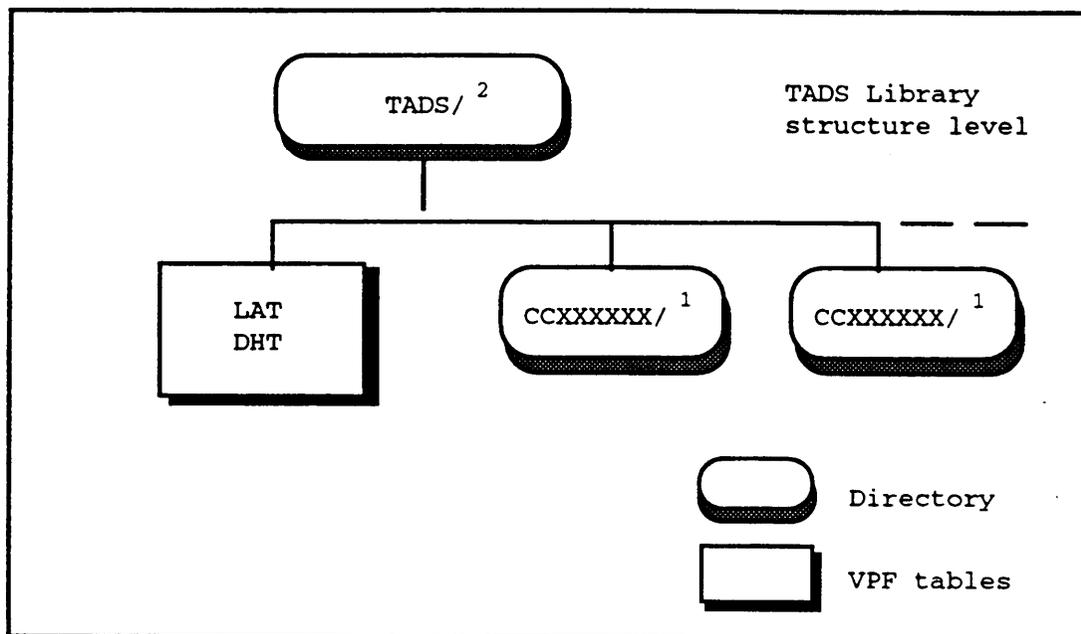

Table or File Description	Table or File Name
TADS database directory	TADS
Library Attribute (Extent) Table	LAT
Database Header Table	DHT
Library directories	CCXXXXXX/1

NOTE:

1. This is a representative directory name for a TADS library.

a. The LAT defines the names of each library in the TADS database and the geographic extent of each library. The LAT contains an XMIN and YMIN column that represent the longitude and latitude of the southwest corner of a library. The XMAX and YMAX columns represent the longitude and latitude of the northeast corner of a library.

MIL-PRF-89040A

**NOTES:**

1. This is a representative directory name for TADS libraries; the format will be ccxxxxxx, where cc represents a country code and xxxxxx represents ITD cell code.
2. Actual database names may vary based on geographic area and number of libraries per database.

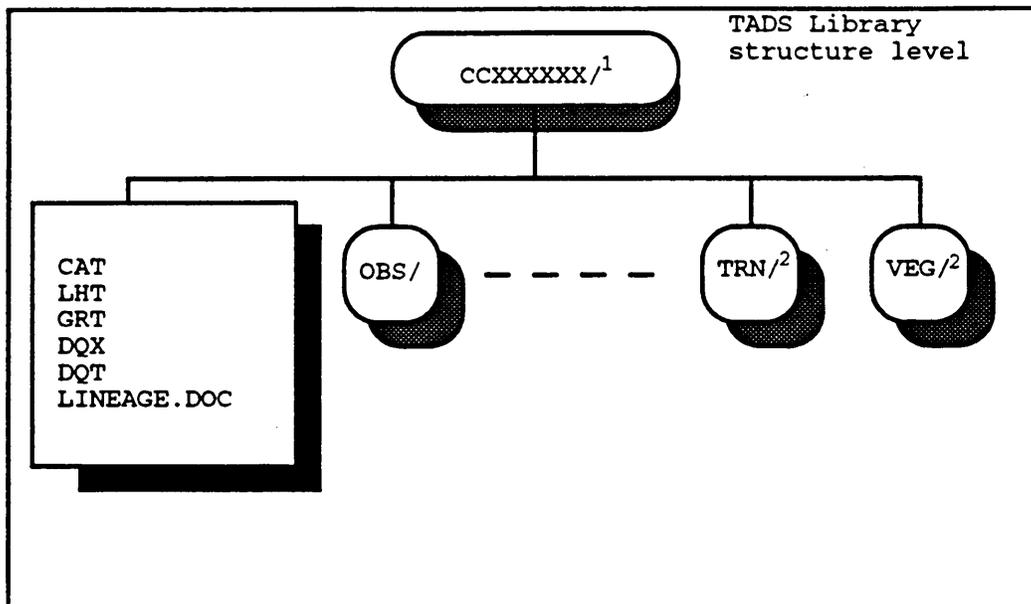

FIGURE 3. TADS database structure-level tables and files.

b. The DHT provides information pertinent to the entire TADS database. The database header table provides information such as the VPF version used to implement the database and security information for the entire database.

3.14.2 Library-level directory files. The contents of each TADS library are stored in a directory whose name shall be no more than eight characters in length. The entire contents of one or more TADS libraries shall be contained on a CD-ROM. A representation of files present in the TADS library level is given in FIGURE 4.

3.14.3 Library metadata. Each library directory shall contain four required metadata tables, one variable-length index, and optional narrative table. These include the coverage attribute (description) table (CAT), library header table (LHT), geographic reference table (GRT), data quality index (DQX), data quality table (DQT). Each TADS library must contain these four VPF files, the index, and an optional narrative (.DOC) table (See TABLE 9).

MIL-PRF-89040A

**NOTES:**

1. This is a representative directory name for TADS libraries, format CCXXXXXX
2. These represent coverage-level coverage directories.

FIGURE 4. TADS library structure level.TABLE 9. TADS library level directories, tables, indices, and description.

Table or File Description	Table or File Name
Library Directory	CCXXXXXX/1
Coverage Attribute (Description) Table	CAT
Library Header Table	LHT
Geographic Reference Table	GRT
Data Quality Index File	DQX
Data Quality Table	DQT
Lineage Documentation File	LINEAGE.DOC

NOTE:

1. This is a representative directory name for TADS libraries.
 - a. The CAT contains the name of each coverage (stored at the coverage level) present in a library, including a brief description of each coverage and its topology level. The coverage description column is the equivalent of the thematic layer name. For a discussion of topology see MIL-STD-2407.
 - b. The LHT identifies the library name, contains information regarding source data, and provides security information.

MIL-PRF-89040A

c. The GRT contains geographic reference metadata regarding the ellipsoid, datum characteristics, and projection information for each TADS library.

d. The DQX is a variable-length index file to the DQT. The DQT contains data quality information pertinent to the particular TADS library.

e. The DQT contains information pertaining to the feature completeness, consistency, compilation date, attribute accuracy, and positional accuracy of the data. The DQT table contains variable-length text records and therefore has an associated variable-length index file (DQX) to reference variable-length text fields.

f. The LINEAGE.DOC table is a data quality file. The table describes how the data were processed for the database. It provides a textual description of the sources used to compile the data in each TADS library.

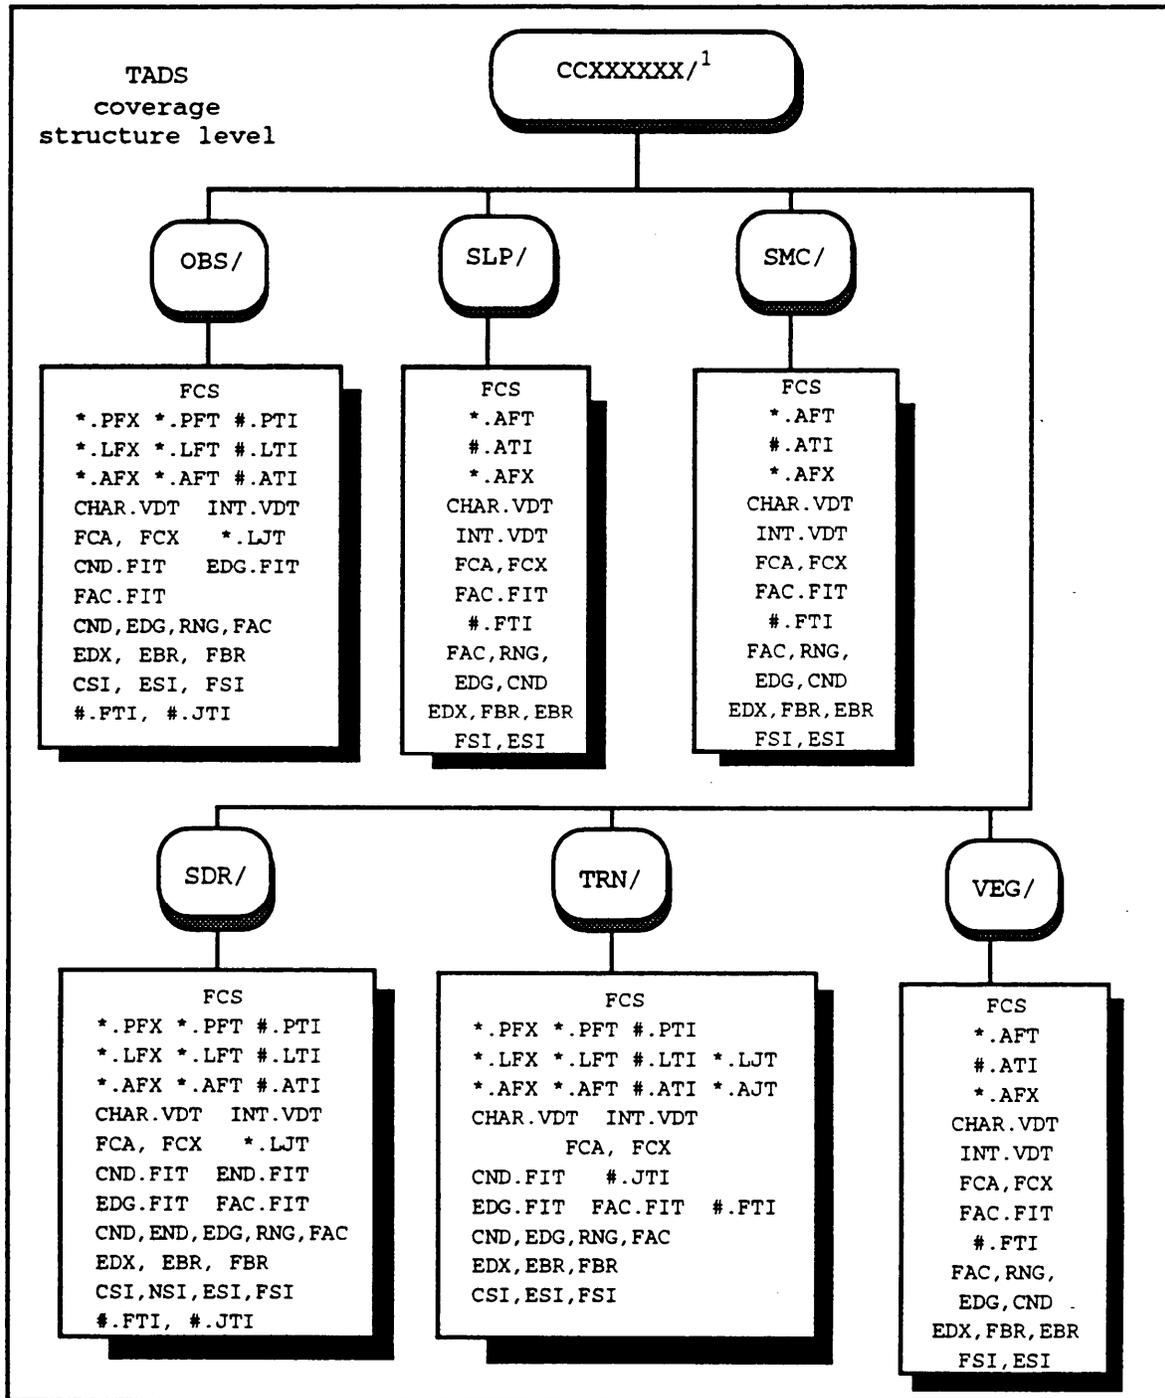

3.14.4 Coverage-level directory files. All six thematic coverages are contained within a library directory. Thematic coverages share the same coordinate system, are spatially registered to one another, and contain primitive tables. A representation of files in the TADS coverages are depicted in FIGURE 5. A list of the TADS coverage directories and brief description are shown in TABLE 10.

TABLE 10. Coverage directories and descriptions for CCXXXXXX coverages.

Coverage Description	Coverage Name
Obstacles	OBS
Slope/Surface Configuration	SLP
Soil/Surface Materials	SMC
Surface Drainage	SDR
Transportation	TRN
Vegetation	VEG

3.14.4.1 Coverage metadata. The metadata tables present and their content will vary with each coverage. Each coverage directory shall contain one feature class schema table (FCS). All coverages that contain feature tables having the FACC feature code column will have a character value description table (CHAR.VDT). If additional FACC attributes are present that require description of their values, then an integer value description table (INT.VDT) may be present. The metadata tables at the coverage level are shown in TABLE 11.

MIL-PRF-89040A

**NOTES:**

1. These are representative TADS library directory names.
- * The asterisk is replaced with the prefix of the point, node, line, or area feature class name.
- # The pound sign is replaced with the prefix of the thematic index name, which is based on the column name to which the index refers.

FIGURE 5. Coverage level roadmap.

MIL-PRF-89040A

TABLE 11. TADS coverage-level metadata tables and description.

Table Name	Table Description
FCS	Feature class schema table
CHAR.VDT	Character value description table
INT.VDT	Integer value description table
FCA	Feature Class Attribute table
FCX	Variable Length Text file for FCA

3.14.4.1.1 Feature class schema table. Each TADS coverage shall contain one feature class schema table (FCS). The FCS defines the relationship between two tables, principally between a feature table and its associated primitive table. The FCS may also define relationships between feature tables and related attribute tables.

3.14.4.1.2 Value description tables. The VDTs provide descriptions (or meanings) of unique FACC attribute values contained in a feature table. A value description table shall be referenced for all coded attribute values. CHAR.VDT tables provide the meanings of the FACC feature codes that are stored as a character data type. INT.VDT tables provide meanings for FACC attribute values that are represented as either long or short integers. Each record in a value description table contains a feature table name, an attribute name, the attribute value, and the meaning specified for that value. Attribute names are repeated in subsequent records when multiple attribute values exist for the feature tables in a coverage. For example, the FACC attribute BCC-Bridge Bypass Condition may have 0, 1, 2, and 3 as possible coded values. These values would be described in an integer value description table. In this case the integer value description table will contain four records, each containing the meaning of these values ("Unknown", "Easy to Cross", "Difficult to Cross", and "Impossible to Cross", respectively.) The name of the value description table associated with an attribute column is indicated in the header of each feature table. The value description tables implemented in each coverage are provided in Appendix A, Section 6.

3.14.4.1.3 Feature index.

a. A feature index is created for each data coverage. This index is composed of (1) a feature class attribute table (FCA) and (2) a number of feature index tables (FIT). Feature index tables allow quick retrieval of feature information when given a selected primitive. In a coverage there will be one FIT for each primitive type that has a relationship to a feature table. When a FIT is defined for a coverage, all feature classes in that coverage will be indexed. All FCA and FITs reside at the coverage level.

MIL-PRF-89040A

b. The Feature Class Attribute table (see TABLE 12) will have the following columns: a feature class ID column (ID), a feature class name column (FCLASS), the feature type (TYPE) and a feature class description column (DESCR).

TABLE 12. Feature class attribute table (FCA) definition.

{Header Length}L; Feature Class Attribute Table;-; ID=I,1,P,Row Identifier,-,-,-,; FCLASS=T,8,U,Feature Class Name,-,-,-,; TYPE=T,1,N,Feature Type,CHAR.VDT,-,-,-,; DESCR=T,*N,Description,-,-,-,;			
1	SDRPOINT	P	Dam on area
2	SDCLINE	L	Canal and river line
3	SDRAREA	A	Open water and island
:	:	:	:
n	n	n	n

c. Every primitive/feature reference results in one entry in the appropriate FIT for that primitive and the corresponding feature.

d. Feature Index Tables (see TABLE 13) contain the feature class ID (FC_ID) and the feature ID (FEATURE_ID) columns to properly identify an individual geographic feature, and the primitive ID (PRIM_ID) for a primitive. Available FIT names are EDG.FIT, CND.FIT, END.FIT, and FAC.FIT.

TABLE 13. Format and example of content for feature index table (END.FIT) for an entity node.

{Header Length}L; Feature Index Table;-; ID=I,1,P,Row Identifier,-,-,-,; PRIM_ID=I,1,N,Primitive ID,-,END1FIT.FTI ¹ ,-,; FC_ID=I,1,N,Feature Class ID,-,END2FIT.FTI,-,; FEATURE_ID=I,1,N,Feature Table ID,-,END3FIT.FTI,-,;			
1	23	1	1
2	189	1	56
3	566	1	787
4	76	1	452
:	:	:	:
n	n	n	n

NOTE:

1. Example name of the index based on the primitive type and referenced columns (1=primitive, 2=feature class, and 3=feature) of FIT.

MIL-PRF-89040A

3.14.4.1.4 Feature join tables. These tables are used to combine multiple feature tables, primitive tables, and attribute tables into relational form. A feature join table connects the row of the feature with rows of a feature or primitive table. A join is used to relate one column in a table with a column in a second table. TABLE 14 defines a feature join table contents.

TABLE 14. Example of line join table.

(Header Length)L;		
TRRLINE.LJT,Railroad Line Join Table;-;		
ID=I,1,P,Row Identifier,-,-,-,;		
TRRLINE.LFT_ID=I,1,N,Feature Key,-,TRRLINE4.JTI,-,;		
EDG_ID=I,1,N,Primitive primary Key,-,EDG4.JTI,-,;		
1	2	67
2	2	68
3	2	69
4	4	121
:	:	:
n	n	n

a. On the obstacles, surface drainage, and transportation coverages that contain line feature tables, linear join tables will be implemented. These tables relate such features as roads, railroads, streams, and walls, where one linear feature may share many edge primitives. An area join table will be implemented for area railroad yard features to account for multiple face primitives. These relationships will be based entirely on how the data was originally collected, no new processing or grouping of these features or primitives that would change this relationship will be performed, unless the original data was related incorrectly.

b. For coincident features, many features to one primitive such as point bridge and bridge spans, a join column on the feature table will be implemented rather than a separate join table.

3.14.4.2 Coverage-level coverages. All TADS libraries may contain six coverages. The contents of each coverage are stored in a directory whose name shall be represented in lower case letters (table examples are shown in upper case) with a three-character name representative of the thematic layer name (See TABLE 10). Coverage-level directories are stored at the VPF coverage level, and reside as subdirectories of each TADS library directory.

3.14.4.3 Coverage topology. The topology level of each coverage is specified in the coverage attribute (description) table (CAT).

MIL-PRF-89040A

3.14.5 Feature class structure level.3.14.5.1 Feature class definition.

a. A feature class consists of a thematically consistent set of data with all features in a feature class sharing the same attribute columns. A feature class is logically defined as the combination of a feature table and a geometric primitive table. For example, the SDRPOINT feature class is composed of the Surface Drainage point feature table (SDRPOINT.PFT) and the related set of primitives in the entity node primitive table (END).

b. Although a feature class is considered to be a structure level of VPF, along with the database, library, and coverage levels, feature classes are not represented as directories. Rather, the feature class levels are represented by a combination of files stored at the coverage level. A feature class is defined as a group of features sharing a homogeneous set of attributes and consists of one or more attribute categories and one or more primitive tables. These primitive tables store the spatial and geometric information defining the location of the features. Each coverage will contain at least one feature class.

c. The definition of all possible features and attributes for each feature class in the TADS is presented in Appendix A, Section 6.

3.14.5.1.1 Feature class metadata. All feature class metadata tables are defined at the coverage level.

3.14.5.1.2 Feature class types. The TADS database contains four types of feature classes: point, node, line, and area. Consequently there are four types of feature tables that may comprise a feature class. Feature tables are named using the feature class name as the prefix and a predefined VPF suffix. The suffixes for each feature class type are shown in TABLE 15. Point feature tables and node feature tables contain the same suffix (.PFT).

TABLE 15. Feature table suffixes.

Table name	Suffix
Point Feature Table	.PFT
Node Feature Table	.PFT
Line Feature Table	.LFT
Area Feature Table	.AFT

3.14.5.1.3 Feature class/feature table names. Feature class names and descriptions are product-specific. For example, in the TRN coverage, one of the line feature class names is TRRLINE. The text description for this feature class is "Transportation Railroad Line feature class." The TRRLINE feature class name is

MIL-PRF-89040A

used as the prefix for the feature table name. The Transportation Railroad Line feature table name is therefore, TRRLINE.LFT as shown in TABLE 16. See Appendix A, Section 6 for all features for the complete feature class names and their contents.

TABLE 16. TADS coverage-level coverages and feature classes.

Coverage name (description)	Feature classes			
	Point	Node	Line	Area
OBS (Obstacles)		OBSNODE	OBSLINE	OBSAREA
SLP (Slope/Surface Configuration)				SLPAREA SLWAREA
SMC (Soil/Surface Material)				SMCAREA SMWAREA
SDR (Surface Drainage)	SDRPOINT	SDRNODE	SDRLINE SDCLINE	SDRAREA SDCAREA
TRN (Transportation)		TRNNODE TRBDGND	TRBLINE TRDLINE TRNLINE TRRLINE	TRNAREA
VEG (Vegetation)				VEGAREA VGWAREA VGFAREA

3.14.5.1.4 Number of feature classes. The complete set of possible feature classes within each coverage is described in this specification; however, only those feature classes containing data need be present in a coverage. The presence or absence of a feature class depends upon data content, availability, and geographic location.

3.14.5.1.5 Point feature class. A point feature class is composed of a point feature table (PFT) in combination with an entity node table (END). For instance, the SDRPOINT point feature class contains attributes in the Surface Drainage Point feature table (SDRPOINT.PFT). The coordinate locations of these features are stored as entity node primitives in an entity node table (END).

3.14.5.1.6 Node feature class. Another type of point feature class is composed of a node feature table (PFT) in combination with a connected node table (CND). SDRNODE is an example of a node feature class with connected nodes. This feature class contains attributes in the Surface Drainage Node point feature table (SDRNODE.PFT), which defines prepared raft or float bridge sites, fords, locks, and geographic information points (miscellaneous features). The coordinate locations of these features are stored as connected node primitives in a connected node table (CND). A node feature class may only be

MIL-PRF-89040A

present when a line feature class exists and the nodes are located on the ends of the line features.

3.14.5.1.7 Line feature class. A line feature class is composed of a line feature table in combination with an edge table (EDG). For instance, the TRDLINE line feature class contains attributes in the Transportation Road Line feature table (TRDLINE.LFT), which defines roads. The primitives representing the spatial location of these features are located in the edge primitive table (EDG).

3.14.5.1.8 Area feature class. An area feature class is composed of an area feature table and a face (FAC) table. For example, the VEGAREA area feature class contains the attributes in the Vegetation Area Feature Table that define an area as land subject to inundation, cropland, vineyards, etc. The face table (FAC) points to the ring (RNG) table, which in turn points to the edge table (EDG).

3.14.5.2 Feature table structure and contents. All feature tables follow a similar structure. Each contains a row identifier column (or ID). The column F_CODE contains a five-character FACC feature code value. The remaining attribute columns, if present, contain a three-character value that represents an attribute code. Sample point, node, line, and area feature tables are presented in TABLES 17 through 20.

TABLE 17. Format and example of content for a point feature table (SDRPOINT.PFT).

⋮	⋮	⋮	⋮
n	n	n	n

NOTE:

1. For TRNAREA.AFT feature class, FAC_ID column is not present, because the column is contained in the join and feature index tables.

3.14.6 Primitive tables and associated files.

a. TADS data contain up to four geometric primitive types. The geometric primitive tables are entity node, connected node, edge, and face. Primitive tables also contain the coordinate values that locate the geographic positions of the nodes, edges, and faces. The primitive tables and associated files are shown in TABLE 21.

TABLE 21. Primitive table and associated files.

Example of Feature Table	Primitive Table	Table Description
Line feature table	ESI	Edge spatial index file
	EBR	Edge bounding rectangle table
	EDX	Edge variable-length index file
	EDG	Edge primitive table
Area feature table	FSI	Face spatial index file
	FBR	Face bounding rectangle
	FAC	Face primitive table
	RNG	Ring table
Point feature table	NSI	Entity node spatial index file
	END	Entity node primitive table
Node feature table	CSI	Connected node spatial index file
	CND	Connected node primitive table

b. Other VPF tables associated with primitives include ring tables, spatial index tables, variable-length index tables, and bounding rectangle tables. This section provides the format for a ring table and for bounding rectangle tables. The format for spatial and variable-length index tables is provided in 3.12.3.

MIL-PRF-89040A

3.14.6.1 Entity node primitive table.

a. In the TADS database, entity nodes represent point features such as dams. The coordinates in an entity node primitive table represent the geographic positions of point features that are not connected to edges. The entity node table is topologically linked to the face primitive table by the CONTAINING_FACE column.

b. The entity node primitive table may be composed of the following VPF columns: the row identifier (ID), a containing face column (CONTAINING_FACE), and a coordinate column (COORDINATE) containing the x,y coordinate values of the entity node. The format for an entity node primitive table is shown in TABLE 22.

TABLE 22. Format and example of content for entity node primitive table (END).

{Header Length}L;

3	4	-7.843663 43.768391
:	:	:
n	n	x.xxxxxx y.yyyyyy

3.14.6.2 Connected node primitive table.

a. In the TADS database, connected nodes represent node features such as prepared raft or float bridge sites, fords, and locks that intersect line features. Connected nodes are used in two ways: 1) to define the edges topologically, start and end nodes, and 2) to represent a node feature that exists at start or end node of an edge. The coordinates for connected nodes are stored in a connected node table. The edges that are connected to nodes are topologically linked by the FIRST_EDGE column in the connected node table. No CONTAINING_FACE column will be present in a connected node table.

b. The connected node primitive table is composed of the following VPF columns: the row identifier (ID), the first edge (FIRST_EDGE) column, and a coordinate column (COORDINATE) containing the x,y coordinate values of the connected node. The format for a connected node primitive table is shown in TABLE 23.

MIL-PRF-89040A

TABLE 23. Format and example of content for connected node primitive table (CND).

{Header Length}L; Connected Node Primitive Table;-; ID=I,1,P,Row Identifier,-,-,-,; FIRST_EDGE=I,1,N,Foreign Key to Edge Table,-,-,-,; COORDINATE=C,1,N,Coordinates of Connected Node,-,-,-,;		
1	2	7.893952 43.774712
2	3	7.893897 43.773613
3	4	7.843663 43.768391
⋮	⋮	⋮
n	n	x.xxxxxx y.yyyyyy

3.14.6.3 Edge primitive table.

a. In the TADS database, edges represent linear features such as aqueducts or roads. Edges also define the borders of faces, which represent areal features such as soil polygons, lakes, and forest. Edges are topologically (1) linked to the nodes at the end of each edge, and (2) the faces on each side of an edge when faces are present in the same coverage (level 3 topology).

b. Edge primitives and their topology are stored in edge primitive tables. Edge primitive tables contain either six or eight VPF columns, depending on the topology level of the coverage. Coverages with level 1 and 2 topology require only six columns to establish connectivity between neighboring edges. Coverages with level 3 topology require two additional columns (RIGHT_FACE and LEFT_FACE) in order to establish connectivity between the edge and the adjoining faces. Every edge table contains a coordinate column containing the x,y coordinate values for each edge. The right and left edges establish winged-edge topology for both line networks and faces. If all edges incident at the node are sorted according to the bearing each edge radiates from that node, the right edge of a particular edge is the first edge encountered, counterclockwise in the sort order, around the end node of that encountered, particular edge. Similarly, the left edge is the first encountered around the start node. The format for edge primitive tables is shown in TABLE 24.

3.14.6.4 Face primitive table.

a. In the TADS database, faces represent areal features such as open water. Faces are areas enclosed by edges. All faces are defined by the set of edges composing the face border. All faces are topologically linked to the appropriate edge table through the ring table.

MIL-PRF-89040A

TABLE 24. Format and example of content for edge (EDG) primitive table.

{Header Length}L; Edge Primitive Table;-; ID=I,1,P,Row Identifier,-,-,-,; START_NODE=I,1,N,Start/Left Node,-,-,-,; END_NODE=I,1,N,End/Right Node,-,-,-,; ¹ RIGHT_FACE=I,1,N,Right Face,-,-,-,; ¹ LEFT_FACE=I,1,N,Left Face,-,-,-,; RIGHT_EDGE=I,1,N,Right Edge from End Node,-,-,-,; LEFT_EDGE=I,1,N,Left Edge from Start Node,-,-,-,; COORDINATES=C,*,N,Coordinates of Edge,-,-,-,;							
1	1	2	6	1	29	26	-10.000000 45.000000
2	3	5	5	8	30	76	- 7.700000 43.690000
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
n	n	n	n	n	n	n	x.xxxxxxx y.yyyyyy

NOTES:

1. The RIGHT_FACE and LEFT_FACE columns are required only for coverages with level 3 topology.
2. Since join tables are implemented, *.LFT_ID column is eliminated.

b. Face primitives and their topology are stored in face primitive tables. Face primitive tables in the TADS database contain the two required VPF columns: a row identifier (ID), and a ring pointer column (RING_PTR), which is a foreign key to a ring table. The face table identifies all faces present in a coverage. It is through the topologic link with a ring table that the relationship between a face, its associated edges, and other surrounding faces is defined. The format for a primitive table is shown in TABLE 25.

TABLE 25. Format and example of content for face (FAC) primitive table.

{Header Length}L; Face Primitive Table;-; ID=I,1,P,Row Identifier,-,-,-,; RING_PTR=I,1,N,Foreign Key to Ring Table,-,-,-,;	
1	1
2	13
3	14
⋮	⋮
n	n

MIL-PRF-89040A

3.14.6.5 Ring table.

a. Rings are connected sets of edges that compose both the external and internal border of a face. The ring table is topologically linked to the face table and edge table within a coverage. The ring table contains three columns: a ring row identifier column (ID), face identifier column (FACE_ID), and a starting edge column (START_EDGE). The first entry in the ring table for a particular face contains the outer ring of that face. The format for all ring tables and an example of content is shown in TABLE 26.

b. A ring table is present when a face primitive table is present.

TABLE 26. Format and example of content for ring (RNG) table.

{Header Length}L; Ring Table;-; ID=I,1,P,Row Identifier,-,-,-,; FACE_ID=I,1,N,Foreign Key to Face Table,-,-,-,; START_EDGE=I,1,N,Foreign Key to Edge Table,-,-,-,;		
1	1	null
2	2	47
3	2	51
⋮	⋮	⋮
n	n	n

3.14.6.6 Bounding rectangle tables. Bounding rectangle tables are present when an edge or face primitive table is present. Each edge and face primitive table in the TADS database has a corresponding edge or face bounding rectangle table (EBR or FBR, respectively). The records in this table are in one-to-one correspondence with the respective edge or face primitive table and provide for rapid retrieval of the spatial extent of a primitive. Examples of the bounding rectangle tables in the TADS database are provided in TABLE 27.

3.15 Naming conventions. TABLE 28 provides the naming conventions for the table extensions or table names for the following VPF tables: feature table extensions, primitive tables, thematic index extensions, spatial index files, and variable-length index extensions.

MIL-PRF-89040A

TABLE 27. Format and example of content for bounding rectangle tables (FBR or EBR).

3.16 CD-ROM labeling and packaging. CD-ROM labeling, labeling on the cardboard sleeve, or jewel case liner/information booklet, as applicable, shall be in accordance with DMA PI 813-102, Guidelines for Labeling The Defense Mapping Agency's CD-ROMs, and Printing and Finishing of Jewel Case Liners/Cardboard Sleeves, and Information Booklets. Method of packaging (cardboard sleeve or jewel case) shall be as specified in the contract (see 5.1).

3.16.1 CD labeling. Labeling of the VITD CDs shall be in accordance with DMA PI 813-102 (therein see Figure 2 for unclassified VITDs or Figure 3 for classified VITDs).

3.16.1.1 Specific VITD labeling items.

- a. Product Logo: VITD CDs shall show the VPF logo.
- b. Product Description: Vector Product Interim Terrain Data (VITD)

MIL-PRF-89040A

- c. Series: VITD
- d. Item: The DMA item name/number.
- e. Edition: Three digit edition number with left filled zeroes
- f. National Stock Number: Assigned as per MIL-STD-2414.

3.16.1.2 Volume identifier. This should be identical to the eleven characters of the Volume Identifier (first eleven characters of ISO 9660 Volume Identifier (32 characters available)) written on the header of the disk (see MIL-HDBK-9660).

3.16.2 Information booklet. Information booklets shall be provided for VITD CDs. Labeling of the VITD information booklet covers shall be in accordance with DMA PI 813-102. When used in conjunction with the jewel case, the front cover of the information booklet also serves as the front cover of the case (therein see Figure 6 for unclassified VITDs or Figure 8 for classified VITDs).

3.16.2.1 Information booklet VITD specific items. All information booklet VITD specific items are the same as those shown on the CD, see 3.16.1.1.

3.16.2.2 Information booklet text. The interior pages of the information booklet shall contain the following statements (note that type should be such that all fit within the two inner surfaces of the booklet):

1. Introduction: VITD is a vector-based digital product that portrays selected military geographic information containing features of tactical military significance as defined in the Tactical Terrain Analysis Data Base (TTADB) specification, MIL-T-89304.

2. Purpose: VITD is designed to supplement the information shown on or contained within the Topographic Line Map products or files. VITD supports tactical military and Geographic Information Systems (GIS) applications for selected geographic areas; and as such, it provides terrain analysis information that is critical to planning and executing joint operations involving close air support missions, logistical operations, and land combat. Through synthesization of Tactical Decision Aids (TDAs), VITD will support such diverse tasks as terrain visualization, mobility/counter-mobility planning, site/route selection, reconnaissance planning, and communication planning. This vector product is used with Digital Terrain Elevation Data (DTED) in many terrain analysis functions.

MIL-PRF-89040A

3. Specifications and Standards: This VITD Compact Disc - Read Only Memory (CD-ROM) was produced under DoD Specification MIL-PRF-89040A, Performance Specification Vector Product Interim Terrain Data (VITD), (date TBD). It is formatted as specified in DoD Standard, MIL-STD-2407, Vector Product Format (VPF) and coded as per the Digital Geographic Information Exchange Standard (DIGEST), Part 4, Feature and Attribute Coding Catalogue (FACC).

3. Datum and Projection:
 Horizontal datum: World Geodetic System 1984 (WGS 84).
 Vertical datum: Mean Sea Level.
 Projection: Not Applicable.

4. VITD Content: VITD is primarily produced from Interim Terrain Data (ITD, MIL-I-89014) product files covering 15 or 30 minute cells. These ITD files are equivalent to the feature and attribute content of the 1:50,000 and 100,000 scale TTADB hardcopy overlays. All these products are individually organized into single subject thematic overlays, files, or layers/coverages consisting of Surface Configuration (Slope), Vegetation, Surface Materials (Soils), Surface Drainage, Transportation (ITD and VITD have enhanced road networks), and Obstacles. Thus, VITD feature and attribute content is consistent with associated hardcopy TTADB products.

5. Comments and Questions: For questions concerning this or other DMA products or services, please telephone the DMA Customer Help Desk: 1-800-455-0899, Commercial 314-260-1236, or DSN 490-1236, or write: Director Defense Mapping Agency, ATTN: ATC, 8613 Lee Highway, Fairfax, VA 22031-2137.

3.16.3 Jewel case liner (back cover of case). Labeling of the VITD jewel case liner shall be in accordance with DMA PI 813-102 (therein see Figure 7 for unclassified VITDs or Figure 9 for classified VITDs).

3.16.4 Cardboard sleeve mailer. If a cardboard mailing sleeve is specified in the contract, it shall be labeled in accordance with DMA PI 813-102 (therein see Figure 11 for unclassified VITDs or Figure 12 for classified VITDs).

4. VERIFICATION

4.1 Classification of inspections. The inspection requirements specified herein are classified as follows:

- a. First article inspection (see 4.2).
- b. Conformance inspection (see 4.3).

MIL-PRF-89040A

4.2 First article inspection. When a first article inspection is required (see 3.1), the product shall be examined as specified in 4.3.1, and tested as specified in 4.3.2.

4.3 Conformance inspection. Quality conformance inspection shall include the examination of 4.3.1 and the tests of 4.3.2.

4.3.1 Examination. The database shall be examined for compliance with the requirements specified in section 3. Unless a waiver has been granted, non-compliance with any of the specified requirements shall constitute cause for rejection.

4.3.2 Tests. A sample determined by the contracting officer shall be read back after generation to ensure all files have been properly transferred.

4.4 Government furnished material. The contractor shall not duplicate, copy, or otherwise reproduce the MC&G property for purposes other than those necessary for performance of the contract.

4.5 Government property surplus. At the completion of performance of the contract, the contractor, as directed by the contracting officer, shall either destroy or return to the Government all government-furnished MC&G property not consumed in the performance of the contract.

5. PACKAGING

5.1 Packaging. For acquisition purposes, packaging requirements shall be as specified in the contract or order (See 6.2). When actual packaging of material is to be performed by DoD personnel, these personnel need to contact the responsible packaging activity to ascertain requisite packaging requirements. Packaging requirements are maintained by the Inventory Control Point's packaging activity within the Military Department or Defense Agency, or within the Military Department's System Command. Packaging data retrieval is available from the managing Military Department's or Defense Agency's automated packaging files, CD-ROM products, or by contacting the responsible packaging activity.

5.2 Marking. Unless otherwise specified (See 6.2), marking shall be in accordance with MIL-STD-129.

MIL-PRF-89040A

6. NOTES

(This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.)

6.1 Intended use.

6.1.1 General usage. The VITD is a product developed to satisfy the armed services short and mid-term requirements for digital terrain analysis data on CD-ROM to support tactical military and C³I GIS systems, emphasizing use among ground forces.

6.1.2 Analysis limitation. The analytical use of VITD data at a scale greater than 1:50,000 may be limited as the result of source material used in compilation.

6.2 Acquisition requirements. Acquisition documents must specify the following:

- a. Title, number, and date of this specification.
- b. Issue of the DoDISS to be cited in the solicitation, and if required, the specific issue of individual documents referenced (see 2.2.1, 2.2.2, and 2.3).
- c. When a first article is required (see 3.1 and 4.2).
- d. Packaging requirements (see 5.1).

6.3 Supersession. These specifications supersede the Performance Specifications for the Vector Interim Terrain Data (VITD) product, MIL-PRF-89040, 8 May 1995.

6.4 Definitions.

6.4.1 TTADB. The Tactical Terrain Analysis Data Base (TTADB) is a 1:50,000 scale geographic information system type data base consisting of a set of selected single subject thematic terrain information overlays used to satisfy tactical military requirements. Data on the physical, biological, and cultural features of the Earth's surface is presented in a hard copy cartographic format.

6.4.2 PTADB. The Planning Terrain Analysis Data Base (PTADB) is a 1:250,000 scale geographic information system type data base consisting of a set of selected single subject thematic terrain information overlays used to satisfy planning military requirements. Data on the physical, biological, and cultural features of the Earth's surface is presented in a hard copy cartographic format.

6.6 Standardization agreements.

This section is not applicable to this specification.

6.7 Changes from previous issue. Marginal notations are not used in this revision to identify changes with respect to the previous issue due to the extent of the changes.

6.8 Classification and special handling of thematic files.

a. The classification of the final VITD files will be determined by the appropriate security section responsible for the final classification. The lowest possible classification of the final product is desired.

b. Even though the final thematic files might be unclassified, a handling caveat could be required. Some NATO and other countries have mapping and other agreements which dictate the handling of materials produced over their country. Security elements should check for caveat requirements at the beginning of each project.

6.9 DMA customer help desk. For questions concerning this or other DMA products, services, or specifications, please telephone the DMA Customer Help Desk at 1-800-455-0899, Commercial 314-260-1236, or DSN 490-1236.

MIL-PRF-89040A
APPENDIX A

TERRAIN ANALYSIS DATA SET (TADS) DATA DICTIONARY

A.1 SCOPE

A.1.1 Scope. This appendix contains some examples of the records that may be contained in the TADS database-level tables. This appendix is a mandatory part of the specification. The information contained herein is intended for compliance.

A.2 APPLICABLE DOCUMENTS

A.2.1 DoD specifications.

a. Interim Terrain Data (ITD) / Planning Interim Terrain Data (PITD), MIL-I-89014.

b. Tactical Terrain Analysis Data base (TTADB), Scale 1:50,000, MIL-T-89304.

A.2.2 DoD standards. Vector Product Format, MIL-STD-2407.

A.2.3 Federal information processing standards. Countries, Dependencies, Areas of Special Sovereignty, and their Principal Administrative Divisions, FIPS PUB 10-3.

A.2.4 Other government documents. Digital Geographic Information Exchange Standard (DIGEST), Part 4, Feature and Attribute Coding Catalogue.

A.3 TADS DATA DICTIONARY ORGANIZATION

A.3.1 Data dictionary organization.

a. The data provided in this appendix are organized according to VPF structure levels. Each TADS database will have its own set of files and tables. The TADS database-level tables appear first and are described in Section A.4. The information provided in database-level tables applies to the entire TADS database. A TADS database will contain multiple libraries. Each library is the equivalent area of an existing ITD cell. Section A.5 contains the library-level tables and VPF coverages for the data libraries. Section A.6 contains a listing of the FACC feature and attribute codes with descriptions, feature tables, and feature schema tables representing each coverage. Section A.7 contains a list of attribute codes, valid attribute ranges, and their null and unknown values for all TADS attributes.

b. In this data dictionary, a brief description of each feature table is provided, followed by the appropriate FACC feature and attribute codes for that table. Definitions of both feature and attribute codes are documented after the appropriate character value description tables. All VPF tables consist of a header that

MIL-PRF-89040A

APPENDIX A

is followed by the actual record contents. This appendix contains some examples of the records that may be contained in actual tables. The data structure and contents for both the metadata tables and feature tables that may be present within a coverage are defined in this appendix. Tables not presented in this appendix appear in the main document section of this military specification, specifically, the format and structure of index files and primitive tables.

A.3.2 Notes regarding table format.

a. The header portion of each table (top half of each illustration) defines the entries required for the VPF table header. The content portion (bottom half) of each table defines the record entries for the data fields.

b. A semicolon (;) is a separator for the four components of a header.

c. The colon (:) indicates the end of a column definition.

d. Carriage returns are embedded in the text for readability only. All header information shall be a continuous string of characters with no carriage returns.

e. For more information on the format of a VPF table, see Section 3.12.

f. For tables with a large number of columns and have only one record entry (i.e., DHT, LHT, GRT), the backslash character (\) at the end of a line in the data records section is used to indicate that the record entry is continued for each column for that record; no carriage returns are implied. This format permits the data records for a large number of columns to be represented so that they may fit on a page of this document.

A.4 TADS DATABASE-LEVEL VPF TABLES AND CONTENTS

A.4.1 TADS VPF table structure and content. The structure and content of each VPF table in the TADS database directory are provided in this section.

A.4.2 Database-level metadata tables. The high resolution TADS database directory file name is the first file to appear on a CD-ROM followed by database-level metadata files as follows:

TADS ¹	database directory file
LAT	library attribute (extent) table
DHT	database header table

NOTE:

1. Actual database names may vary based on geographic area and number of libraries per database.

MIL-PRF-89040A
APPENDIX A

A.4.2.1 Library attribute (extent) table (LAT). The library attribute table contains the name and geographic extent for each library in the database (TABLE 29). In TADS, each library will correspond to the existing ITD cell. The library name consists of eight characters. The first two characters relate to the country code as referenced in FIPS PUB 10-3 and the last six characters equate to the map sheet referenced in the Data Set Identification Number, DSI Group, DSI Record of MIL-I-89014. In some countries duplicate sheet numbers may exist, such as in the United States. In this case the country has different series numbers that divide the country in half. In each case the third character will either be "E" for East or "W" for West, followed by the remaining five digit code. The DSIN is right-justified. For example, the Killeen, Texas ITD cell would be represented as library name "USW64462". Here "US" represents the United States and "W" represents the western half of the US, and 64462 represents the Killeen 1:50000 scale topographic map sheet 6446II that defines the boundary of the ITD cell. For situations where the use of "E" for East or "W" for West is not appropriate, an "N" for neither will be used. If any Roman numerals are used, these are to be converted to Arabic numbers (e.g., IV = 4, XII = 12). If ITD is used, longitude and latitude coordinates may be derived from the Data Set Parameter Group (DSPG) of the DSI Record.

TABLE 29. Format and content for library attribute (extent) table.

{Header Length}L;

MIL-PRF-89040A
APPENDIX A

A.5 TADS DATA LIBRARY

A.5.1 TADS data library structure and content.

a. The structure and content of each VPF table in a data library of the TADS database are provided in this section. All tables presented in this section apply to every data library in a TADS database. The actual record contents of the metadata tables will vary with each TADS library. Those records that vary are indicated by a footnote mark.

b. Each TADS library is represented as a directory file. The number of TADS libraries are TBD. A library will represent the contents of an existing ITD cell, which is generally the area bounded by the corresponding map sheet.

A.5.2 Library-level metadata tables. Each TADS data library shall contain the following metadata tables at the library level:

CCXXXXXX ¹	directory file
CAT	coverage attribute (description) table
DQT	data quality table
DQX	data quality index file
GRT	geographic reference table
LHT	library header table
LINEAGE.DOC	lineage narrative table

NOTE: 1. Representative directory name for a TADS library.

A.5.2.1 Coverage attribute (description) table. The following CAT shall be present in every TADS data library. TABLE 31 depicts all of the possible records that may be present in the CAT.

TABLE 31. Format and sample content for coverage attribute (description) table (CAT).

{Header Length}L;			
Coverage Attribute (Description) Table;--;			
ID=I,1,P,Row Identifier,-,-,-,;			
COVERAGE_NAME ¹ =T,8,N,Coverage name,-,-,-,;			
DESCRIPTION=T,50,N,Coverage description,-,-,-,;			
LEVEL ² =I,1,N,Topology level,-,-,-,;			
1	OBS	Obstacles	3
2	SLP	Slope/Surface Configuration	3
3	SMC	Soils/Surface Material	3
4	SDR	Surface Drainage	3
5	TRN	Transportation	3
6	VEG	Vegetation	3

NOTES:

1. This table depicts all possible TADS coverages that may be present in a library. Presence of these coverages will vary with data availability. If a TADS library does not contain any data for a particular coverage, then the record describing that coverage will be deleted.
2. The topology level for all coverages in the TADS data library is level 3.

MIL-PRF-89040A
APPENDIX A

A.5.2.2 Library header table. The following LHT shall be present in every TADS library. The format and sample content of the library header table for each library is presented in TABLE 32. The record content of this table will vary for each TADS library. When ITD is used, some of the information will be derived from the Data Set Identification Group (DSIG) and Data Set Security Group (DSSG) of the DSI Record.

TABLE 32. Format and content for example TADS library header table (LHT).

A.5.2.3.1 Table 33 parameters. An explanation of each of the parameters in Table 33 is as follows:

- a. ID = Row identifier required for most tables.
- b. DATA_TYPE = The type of data in the library GEO indicates geographic coordinate data, as opposed to DIG for digitized graphic data (machine/table coordinates), and MAP for map projection coordinates.
- c. UNITS = Unit of measure of the library, for this specification this is interpreted as units of measurement for coordinate of the library, which is degrees, decimal degrees.
- d. ELLIPSOID_NAME = Name of the ellipsoid of the library, all data should be in World Geodetic System 1984.
- e. ELLIPSOID_DETAILS = Details about the ellipsoid includes the ellipsoid code as referenced in MIL-STD-2407, appendix G.

MIL-PRF-89040A
APPENDIX A

- f. VERT_DATUM_NAME = Name of the vertical datum.
- g. VERT_DATUM_CODE = Code of the vertical datum, refer to MIL-STD-2407.
- h. SOUND_DATUM_NAME = Name of the sounding datum, not used in this specification.
- i. SOUND_DATUM_CODE = Code of the sounding datum.
- j. GEO_DATUM_NAME = Name of the geodetic datum, WGS-84 is the datum to be used, unless a DMA conversion from the local datum does not exist, in which case, the local datum will be referenced.
- k. GEO_DATUM_CODE = Code of the geodetic datum; refer to MIL-STD-2407.
- l. PROJECTION_NAME = Name of projection. Since geographic coordinates are required, this record is not applicable.

A.5.2.4 Data quality table. The following data quality table shall be present at the library-level for every TADS library. The record content of this table may vary for each TADS library. The format and sample content of the DOT for each library is presented in TABLE 34. Some of this information will be converted from the Data Set History Group (DSHG) of the DSI Record in MIL-I-89014.

NOTE:

1. Replace with appropriate TADS library name for each appropriate library.

MIL-PRF-89040A
APPENDIX A

A.5.2.5 Lineage narrative table. This table is an optional table and is not required for all libraries. Information regarding specialized sources that were utilized in the compilation of the product is contained within this table. Information about the sources can only be associated at the level of the security classification of the final product. The entire source package should not be contained within this table, only those sources that relate to currency or ground truth to assist the user's evaluation of the data. An example of the format and content is presented in TABLE 35. This table can be used for stating mismatches between VITD sheets due to different source dates.

TABLE 35. Format and content of the lineage documentation table (LINEAGE.DOC).

{Header Length}L; Lineage Documentation Table;-; ID=I,1,P,Row Identifier,-,-,-,; TEXT=T,80,N,Text information,-,-,-,;;	
1	For this library photo sources used in data collection were
2	flown on July 1990. For TRN coverage a road and bridge map
3	V73264462 dated Nov. 1988 was used for the Mil Load classes.
4	For SMC coverage, a 1920 Dutch soil survey containing major
5	soil types with actual location of testholes and drawings of
6	the soil profiles, etc.

A.6 FEATURES AND ATTRIBUTES OF THE DATA LIBRARY

A.6.1 Data dictionary content and consistency with ITD. The data dictionary contains a description of TADS libraries, the name and description of each attribute, attribute values, and explanatory notes for each feature table. The data content is consistent with the ITD features contained within MIL-I-89014.

A.6.2 Data dictionary organization. The coverages presented in the library are Obstacles (OBS), Slope/Surface Configuration (SLP), Soil/Surface Materials (SMC), Surface Drainage (SDR), Transportation (TRN), and Vegetation (VEG). For the contents of the CCXXXXXX¹ library refer to TABLE 36. A brief description is provided for each coverage. The coverage description is followed by value description tables and a schema table for each feature class. Area, line, point, and node feature tables (AFT, LFT, and PFT), when present, appear in that order. The schema tables define the attribute names for that feature class, the attribute descriptions, and the field types. The field type provides the field definition and the field size required to store the attribute data. Join tables are implemented for compound relationships, one-to-many, for selective transportation, obstacles, and surface

MIL-PRF-89040A
APPENDIX A

drainage classes. These explicit relationships are defined only if the features were collected in that manner.

NOTE:

1. This is a representative directory name for a TADS library.

TABLE 36. CCXXXXXXX¹ library feature and primitive tables by coverage.

NOTE:

1. CCXXXXXXX is for example only, which would be replaced by the appropriate library name.

A.6.3 (Data) library coverages.

A.6.3.1 Obstacles coverage. The Feature Class Schema (FCS) table which defines the relationships between the feature and primitives is presented in TABLE 37. Area feature tables, line feature tables, node feature tables, and Feature Class Attribute (FCA) tables are presented in TABLES 38 to 42. This coverage contains area, linear, point, and node features relating to natural

MIL-PRF-89040A
APPENDIX A

obstacles such as escarpments, depressions, and volcanic dikes, and man-made obstacles such as cuts, fills, embankments, walls, etc. A Feature join table is used for linear obstacle features, where a feature may contain multiple edge primitives. The value description tables for the obstacles coverage are provided in TABLES 43 and 44. Most of these obstacles act or function as barriers to the movement of vehicles/personnel through a particular area. Generally linear obstacles are only portrayed if their length is greater than 250 meters, have a slope >60%, and are higher than 1.5 meters (Refer to MIL-T-89304 for more information).

A.6.3.1.4 Obstacles coverage glossary.

AREA FEATURES

AL060 Dragon Teeth Regularly spaced concrete or metal barriers laid in single or multiple rows to prevent vehicle movement.

DB080 Depression A low area surrounded by higher ground.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

LINE FEATURES

AL060 Dragon Teeth Regularly spaced concrete or metal barriers laid in single or multiple rows to prevent vehicle movement.

AL260 Wall A solid man-made barrier of heavy material used as an enclosure or boundary or for protection.

AQ113 Pipeline/Pipe A tube for the conveyance of liquids or gases.

LOC Location Category Placement relative to ground surface, water surface, or shoreline.

BH100 Moat A trench usually filled with water, that surrounds a body of land.

DB010 Bluff/Cliff/Escarpment A steep, vertical, or overhanging face of rock or earth.

MIL-PRF-89040A
APPENDIX A

DB070 Cut An excavation of the Earth's surface to provide passage for a road, railroad, canal, etc.

DB090 Embankment A raised solid fill linear mound of earth or other material.

USE Usage Use.

DB190 Volcanic Dike A steep ridge of igneous rock.

EA020 Hedgerow A continuous growth of shrubbery planted as a fence, a boundary, or a wind break.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

NODE FEATURES

AL195 Ramp An inclined plane usually man-made for moving between two different levels. (Used for pipeline crossing point)

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

A.6.3.2 Slope/surface configuration coverage. This coverage contains area features that represent homogeneous classes of ground slope ranges. The Feature Class Schema table creates the relationship between the feature class and primitive tables as shown in TABLE 45. Area feature tables and feature classes are

MIL-PRF-89040A

APPENDIX A

presented in TABLES 46 through 48. The value description tables for the surface configuration coverage are provided in TABLES 49 and 50. Slope ranges are expressed in percent slope (Tangent of the angle X 100) and defined as the degree or extent of deviation from the horizontal. Selected water bodies are delineated as separate features. Minimum size for an area feature is 50,000 square meters ground area (polygon = 50m by 1000m).

AREA FEATURES

SA010 Common Open Water An area containing any surface water that is flowing or free standing such as lakes, canals, rivers, oceans, reservoirs, etc.

SA050 Slope Polygon An area enclosing a group of slope values falling within a set range.

GSC Ground Slope Category Range indicating the slope of ground within delineated area of feature, reported in percent.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

A.6.3.3 Soil/surface materials coverage. The Feature Class Schema table creates the relationship between the feature class and primitive tables as shown in TABLE 51. Area feature and feature class attribute tables are presented in TABLES 52 through 54. The value description tables for the surface materials coverage are provided in TABLES 55 and 56. This coverage contains soil groupings base on the Unified Soil Classification System and other surface materials such as rock outcrops, permanent snowfields, and evaporites. Selected water bodies and urban areas are delineated as features and represented as a separate feature class. The Surface Roughness Description (SRD) contains textual description on the micro-relief of the terrain within that soil

AREA FEATURES

DA010 Ground Surface Element The surficial layer of consolidated and unconsolidated earth materials occurring on the land surface.

SDC Soil Depth Category Estimated general depth of soil or unconsolidated surface material.

SRD Surface Roughness Description A code that describes the condition of the surface material that may be used for mobility predictions, construction material, and landing sites.

SA010 Common Open Water An area containing any surface water that is flowing or free standing such as lakes, rivers, oceans, reservoirs, etc.

SA020 Disturbed Soil An area that has been so disturbed by human activity that no single soil type can be accurately identified. These areas may include built-up areas, strip mines, landfills, railroad yards, etc.

STP Soil Type Soil categories described by the Unified Soil Classification System (USCS).

SWC Soil Wetness Condition General moisture content or condition of the soil.

SA030 Exposed Bedrock Areas that contain no or little soil (less than 10%) containing bare rock or other extrusive material such as lava.

SRD Surface Roughness Description A code that describes the condition of the surface material that may be used for mobility predictions, construction material, and landing sites.

MIL-PRF-89040A
APPENDIX A

SA040 Permanent Snowfield An area permanently covered by snow or ice that covers a land mass, such as glaciers and snowfields.
SRD Surface Roughness Description A code that describes the condition of the surface material that may be used for mobility predictions, construction material, and landing sites.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).
TXT Text Attribute Narrative or other description.

A.6.3.4 Surface drainage coverage. This coverage contains areal, linear, point, and node features relating to surface hydrographic features such as rivers, canals, locks, dams, and lakes. The feature class schema table creates the relationship between the feature class and primitive tables as shown in TABLE 57. Area, line, point, node, join, and feature class attribute tables are presented in TABLES 58 thru 66. Feature join tables are used for linear surface drainage features where a feature may contain multiple edge primitives, such as a river, canal, or dam. The value description tables for the surface drainage coverage are provided in TABLES 67 and 68. River and canals with gap width greater than 180 decimeters (18.0 meters)

MIL-PRF-89040A
APPENDIX A

will be portrayed as area features, and those less than or equal to 180 decimeters as line features.

TABLE 57. Surface drainage feature class schema table (FCS).

A.6.3.4.7 Surface drainage coverage glossary.**AREA FEATURES**

BA030 Island A land mass smaller than a continent and surrounded by water.

BH020 Canal A man-made or improved natural waterway used for transportation.

BGL Bank Gradient Left Slope of the left bank above water level (facing downstream). In this product default values represent ranges.

BGR Bank Gradient Right Slope of the right bank above water level (facing downstream). In this product default values represent ranges.

BHL Bank Height Left (decimeters) Height of the left bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BHR Bank Height Right (decimeters) Height of the right bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BVL Bank Vegetation Left Density of vegetation found on the downstream left bank.

BVR Bank Vegetation Right Density of vegetation found on the downstream right bank.

MCC Material Composition Category Composition material, excluding surface material.

WD3 Military Gap Width (decimeters) The minimum horizontal bridging distance between banks. In this product default values represent ranges in decimeters.

WDA Water Depth Average (meters) The average water depth (in meters). In this product coded values represent ranges.

WVA Water Velocity Average (meters/second) Average velocity of the stream. In this product coded values are implemented.

MIL-PRF-89040A

APPENDIX A

BH140 River/Stream A natural flowing watercourse.

BGL Bank Gradient Left Slope of the left bank above water level (facing downstream). In this product default values represent ranges.

BGR Bank Gradient Right Slope of the right bank above water level (facing downstream). In this product default values represent ranges.

BHL Bank Height Left (decimeters) Height of the left bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BHR Bank Height Right (decimeters) Height of the right bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BVL Bank Vegetation Left Density of vegetation found on the downstream left bank.

BVR Bank Vegetation Right Density of vegetation found on the downstream right bank.

TID Tidal/Non-Tidal Category Identifies whether a feature is affected by tidal water.

MCC Material Composition Category Composition material, excluding surface material.

HVC Hydrological Category Identifies the annual water content of the feature.

WD3 Military Gap Width (decimeters) The minimum horizontal bridging distance between banks. In this product default values represent ranges in decimeters.

WDA Water Depth Average (meters) The average water depth (in meters). In this product coded values represent ranges.

WVA Water Velocity Average (meters/second) Average velocity of the stream. In this product coded values are implemented.

DB200 Gully/Gorge A long, narrow, deep erosion with steep banks.

BGL Bank Gradient Left Slope of the left bank above water level (facing downstream). In this product default values represent ranges.

BGR Bank Gradient Right Slope of the right bank above water level (facing downstream). In this product default values represent ranges.

BHL Bank Height Left (decimeters) Height of the left bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BHR Bank Height Right (decimeters) Height of the right bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BVL Bank Vegetation Left Density of vegetation found on the downstream left bank.

BVR Bank Vegetation Right Density of vegetation found on the downstream right bank.

MCC Material Composition Category Composition material, excluding surface material.

MIL-PRF-89040A

APPENDIX A

WD3 Military Gap Width (decimeters) The minimum horizontal bridging distance between banks. In this product default values represent ranges (in decimeters).

WDA Water Depth Average (meters) The average water depth (in meters). In this product coded values represent ranges.

WVA Water Velocity Average (meters/second) Average velocity of the stream. In this product coded values are implemented.

SA010 Common Open Water An area containing any surface water that is flowing or free standing such as lakes, rivers, oceans, reservoirs, etc.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

LINE FEATURES

AQ111 Prepared Raft or Float Bridge Site Site on a river or canal which has ramp, piling, and/or pier structures constructed on one or both shores, to allow for suitable future crossing operations using float bridge or rafting equipment.

BH020 Canal A man-made or improved natural waterway used for transportation.

BGL Bank Gradient Left Slope of the left bank above water level (facing downstream). In this product default values represent ranges.

BGR Bank Gradient Right Slope of the right bank above water level (facing downstream). In this product default values represent ranges.

BHL Bank Height Left (decimeters) Height of the left bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BHR Bank Height Right (decimeters) Height of the right bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BVL Bank Vegetation Left Density of vegetation found on the downstream left bank.

BVR Bank Vegetation Right Density of vegetation found on the downstream right bank.

MCC Material Composition Category Composition material, excluding surface material.

WD3 Military Gap Width (decimeters) The minimum horizontal bridging distance between banks. In this product default values represent ranges (in decimeters).

WDA Water Depth Average (meters) The average water depth (in meters). In this product coded values represent ranges.

WVA Water Velocity Average (meters/second) Average velocity of the stream. In this product coded values are implemented.

MIL-PRF-89040A
APPENDIX A

BH070 Ford A shallow place in a body of water used as a crossing.

BH140 River/Stream A natural flowing watercourse.

BGL Bank Gradient Left Slope of the left bank above water level (facing downstream). In this product default values represent ranges.

BGR Bank Gradient Right Slope of the right bank above water level (facing downstream). In this product default values represent ranges.

BHL Bank Height Left (decimeters) Height of the left bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BHR Bank Height Right (decimeters) Height of the right bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BVL Bank Vegetation Left Density of vegetation found on the downstream left bank.

BVR Bank Vegetation Right Density of vegetation found on the downstream right bank.

HYC Hydrological Category Identifies the annual water content of the feature.

MCC Material Composition Category Composition material, excluding surface material.

TID Tidal/Non-Tidal Category Identifies whether a feature is affected by tidal water.

WD3 Military Gap Width (decimeters) The minimum horizontal bridging distance between banks (in decimeters). In this product default values represent ranges.

WDA Water Depth Average (meters) The average water depth (in meters). In this product coded values represent ranges.

WVA Water Velocity Average (meters/second) Average velocity of the stream. In this product coded values are implemented.

BI020 Dam A permanent barrier across a watercourse used to impound water or to control its flow.

EXS Existence Category The state or condition of the feature.

HGT Height Above Surface Level (meters) Distance measured from the lowest point of the base at ground or water level (downhill side/downstream side) to the tallest point of the feature.

LEN Length/Diameter (meters) A measurement of the longer of two linear axes (in meters). For a square feature, measure either axis. For a round feature, measure the diameter.

MCC Material Composition Category Composition material, excluding surface material.

WD5 Width Top (meters) The width at the top of the feature (in meters).

BI030 Lock An enclosure, with a pair of gates controlling the water level, used for raising or lowering vessels as they pass from one water level to another.

MIL-PRF-89040A

APPENDIX A

EXS Existence Category The state or condition of the feature.

LEN Length/Diameter (meters) A measurement of the longer of two linear axes (in meters). For a square feature, measure either axis. For a round feature, measure the diameter.

WID Width (meters) A measurement of the shorter of two linear axes on the horizontal plane. For a square feature, measure either axis.

DB200 Gully/Gorge A long, narrow, deep erosion with steep banks.

BGL Bank Gradient Left Slope of the left bank above water level (facing downstream). In this product default values represent ranges.

BGR Bank Gradient Right Slope of the right bank above water level (facing downstream). In this product default values represent ranges.

BHL Bank Height Left (decimeters) Height of the left bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BHR Bank Height Right (decimeters) Height of the right bank above the water level (facing downstream) to the average water level. In this product default values represent ranges in decimeters.

BVL Bank Vegetation Left Density of vegetation found on the downstream left bank.

BVR Bank Vegetation Right Density of vegetation found on the downstream right bank.

MCC Material Composition Category Composition material, excluding surface material.

WD3 Military Gap Width (decimeters) The minimum horizontal bridging distance between banks. In this product default values represent ranges in decimeters.

WDA Water Depth Average (meters) The average water depth (in meters). In this product coded values represent ranges.

WVA Water Velocity Average (meters/second) Average velocity of the stream. In this product coded values are implemented.

SA060 Covered Drainage A natural watercourse or man-made waterway that is covered preventing its observation or further classification.

ACC Accuracy Category The relative accuracy of geographic location.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

MIL-PRF-89040A

A.6.3.5 Transportation coverage.

a. The Feature Class Schema table creates the relationship between the feature class and primitive tables as shown in TABLE 69. This coverage contains areal, linear, and node features relating to roads, railroads, bridges, tunnels, and runways. Area, line, node, join, and feature class attribute tables are presented in TABLES 70 thru 81. Feature join tables are used for linear and area feature classes where a feature may contain multiple primitives. The join relationships will be based entirely on how the data was originally compiled; no new processing or regrouping of the affected features will be performed. A coincident feature, many features sharing one primitive, may exist with the node bridge feature class, where both the bridge and associated spans are node features. The Feature Class Attribute (FCA) table is represented in TABLE 82. The value description tables for the transportation coverage are provided in TABLES 83 and 84.

MIL-PRF-89040A
APPENDIX A

b. Where roads and railroads have associated linear bridges, tunnels, ferries, and fords, only those transportation 'connectors' features are represented. The road or railroad terminates at those features and must be linked with the appropriate features through the topological relationship of the primitive.

TABLE 69. Transportation feature class schema table (FCS).

A.6.3.5.8 Transportation coverage glossary.

AREA FEATURES

AN060 Railroad Yard/Marshalling Yard A system of tracks within defined limits and associated features, which provides for loading/unloading and assembling trains.

CTL Cumulative Track Length (meters) Total cumulative length of track contained within confines of the feature, exclusive of the branch or main trunk lines running into and/or out of the feature.

EXS Existence Category The state or condition of the feature.

RRA Railroad Power Source Source of power for locomotion.

RRC Railroad Categories The type of railroad system used to support various transportation uses.

GB055 Runway A defined area, usually rectangular, used for the conventional landing and take-off of aircraft.

EXS Existence Category The state or condition of the feature.

FCO Feature Configuration Configuration of the feature objects(s).

LEN Length/Diameter (meters) A measurement of the longer of two linear axes. For a square feature, measure either axis. For a round feature, measure the diameter.

MIL-PRF-89040A
APPENDIX A

RST Road/Runway Surface Type Physical surface composition of feature.

WID Width (meters) A measurement of the shorter of two linear axes. For a square feature, measure either axis. For a round feature, width shall be equal to LEN.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

LINE FEATURES

AN010 Railroad A rail or set of parallel rails on which a train or trolley runs. (Numerous tracks, of the same gauge, on a single bed, shall be treated as one line feature).

EXS Existence Category The state or condition of the feature.

FCO Feature Configuration Configuration of the feature objects(s).

RRA Railroad Power Source Source of power for locomotion.

RRC Railroad Categories The type of railroad system used to support various transportation uses.

AN050 Railroad Siding/Railroad Spur A stretch of railroad track(s) connected to the main track system by switch(es) - used for temporary storage and loading/unloading.

EXS Existence Category The state or condition of the feature.

FCO Feature Configuration Configuration of the feature objects(s).

LEN Length/Diameter (meters) A measurement of the longer of two linear axes. For a square feature, measure either axis. For a round feature, measure the diameter.

RRA Railroad Power Source Source of power for locomotion.

RRC Railroad Categories The type of railroad system used to support various transportation uses.

RSA Railroad Spur/Siding Attribute Type of connecting track.

AN060 Railroad Yard/Marshalling Yard A system of tracks within defined limits and associated features which provides for loading/unloading and assembling trains.

CTL Cumulative Track Length (meters) Total cumulative length of track contained within confines of the feature, exclusive of the branch or main trunk lines running into and/or out of the feature.

EXS Existence Category The state or condition of the feature.

RRA Railroad Power Source Source of power for locomotion.

RRC Railroad Categories The type of railroad system used to support various transportation uses.

AP010 Cart Track An unimproved roadway.

ACC Accuracy Category Accuracy of the relative geographic position.

MIL-PRF-89040A
APPENDIX A

AP030 Road An open way maintained for vehicular use.

ACC Accuracy Category Accuracy of the relative geographic position.

EXS Existence Category The state or condition of the feature.

FCO Feature Configuration Configuration of the feature objects(s).

LOC Location Category Status of feature relative to surrounding area or water.

RST Road/Runway Surface Type The physical surface composition of feature.

SGC Gradient/Slope (percent) The percentage of slope.

WD1 Minimum Travelled Way Width (decimeters) Minimum width of the travelled way, excluding pavements and hard shoulders. In this product units will be in decimeters (0.1 m).

WTC Weather Type Category Weather conditions under which a feature is usable.

AQ040 Bridge/Overpass/Viaduct A man-made structure spanning and providing passage over a body of water, road, railroad, depression, or other obstacles.

BCC Bypass Condition Category The ease or ability to circumvent a destroyed section of a bridge, tunnel or pass within a 2 kilometer distance on each side of the feature. Bypass condition will not consider other bridges in bypass determination.

BRN Bridge Reference Number A unique number relating information to bridge and bridge spans.

EXS Existence Category The state or condition of the feature.

LC1 Load Class Type 1 (tons) Military load classification (weight bearing capacity) for one-way traffic of wheeled vehicles.

LC2 Load Class Type 2 (tons) Military load classification (weight bearing capacity) for two-way traffic of wheeled vehicles.

LC3 Load Class Type 3 (tons) Military load classification (weight bearing capacity) for one-way traffic of tracked vehicles.

LC4 Load Class Type 4 (tons) Military load classification (weight bearing capacity) for two-way traffic of tracked vehicles.

LEN Length/Diameter (meters) A measurement of the longer of two linear axes. For a square feature, measure either axis. For a round feature, measure the diameter. For a bridge, the length in the distance between its abutments.

NOS Number of Spans Number of spans.

OHC Overhead Clearance Category (decimeters) The least distance between the travelled way and any obstruction vertically above it. In this product units will be in decimeters (0.1 m)

TUC Transportation Use Category Identifies the primary user, function, or authority of the transportation system.

UBC Underbridge Clearance Category (decimeters) Clearance below bridge, measured from the lowest surface level to the base of the lower of either a cross beam or the lowest bridge deck. In this product units will be in decimeters (0.1 m).

WD1 Minimum Travelled Way Width (decimeters) Minimum width of the travelled way, excluding pavements and hard shoulders. In this product units will be in decimeters (0.1 m).

MIL-PRF-89040A
APPENDIX A

AQ070 Ferry Crossing A route in a body of water where a ferry crosses from one shoreline to another.

ACC Accuracy Category Accuracy of the relative geographic position.

TUC Transportation Use Category Identifies the primary user, function, or authority of the transportation system.

AQ130 Tunnel An underground or underwater passage, open at both ends, usually containing a road, canal, railroad or aqueduct.

ACC Accuracy Category Accuracy of the relative geographic position.

EXS Existence Category The state or condition of the feature.

LEN Length/Diameter (meters) A measurement of the longer of two linear axes. For a square feature, measure either axis. For a round feature, measure the diameter. For a bridge, the length in the distance between its abutments.

OHC Overhead Clearance Category (decimeters) The least distance between the travelled way and any obstruction vertically above it. In this product units will be in decimeters (0.1 m).

TUC Transportation Use Category Identifies the primary user, function, or authority of the transportation system.

WD1 Minimum Travelled Way Width (decimeters) Minimum width of the travelled way, excluding pavements and hard shoulders. In this product units will be in decimeters (0.1 m).

BH070 Ford A shallow place in a body of water used as a crossing.

GB055 Runway A defined area, usually rectangular, used for the conventional landing and take-off of aircraft.

EXS Existence Category The state or condition of the feature.

FCO Feature Configuration Configuration of the feature objects(s).

LEN Length/Diameter (meters) A measurement of the longer of two linear axes. For a square feature, measure either axis. For a round feature, measure the diameter.

RST Road/Runway Surface Type Physical surface composition of feature.

WID Width (meters) A measurement of the shorter of two linear axes. For a square feature, measure either axis. For a round feature, width shall be equal to LEN.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

NODE FEATURES

AQ040 Bridge/Overpass/Viaduct A man-made structure spanning and providing passage over a body of water, road, railroad, depression, or other obstacles.

BCC Bypass Condition Category The ease or ability to circumvent a destroyed section of a bridge, tunnel or pass within

MIL-PRF-89040A
APPENDIX A

a 2 kilometer distance on each side of the feature. Bypass condition will not consider other bridges in bypass determination.

BRN Bridge Reference Number A unique number relating information to bridge and bridge spans.

EXS Existence Category The state or condition of the feature.

LC1 Load Class Type 1 (tons) Military load classification (weight bearing capacity) for one-way traffic of wheeled vehicles.

LC2 Load Class Type 2 (tons) Military load classification (weight bearing capacity) for two-way traffic of wheeled vehicles.

LC3 Load Class Type 3 (tons) Military load classification (weight bearing capacity) for one-way traffic of tracked vehicles.

LC4 Load Class Type 4 (tons) Military load classification (weight bearing capacity) for two-way traffic of tracked vehicles.

NOS Number of Spans Number of spans.

OHC Overhead Clearance Category (decimeters) The least distance between the travelled way and any obstruction vertically above it. In this product units will be in decimeters (0.1 m).

TUC Transportation Use Category Identifies the primary user, function, or authority of the transportation system.

UBC Underbridge Clearance Category (decimeters) Clearance below bridge, measured from the lowest surface level to the base of the lower of either a cross beam or the lowest bridge deck. In this product units will be in decimeters (0.1 m).

WD1 Minimum Travelled Way Width (decimeters) Minimum width of the travelled way, excluding pavements and hard shoulders. In this product units will be in decimeters (0.1 m).

YLN Length of Greater Precision (decimeters) A measurement of the longer of two linear axes capable of being expressed in decimal meter units. In this product units will be in decimeters (0.1 m).

AQ045 Bridge Span A section of the bridge deck between successive supports such as pillars, piers, or abutments.

ACC Accuracy Category Accuracy of the relative geographic position.

BRN Bridge Reference Number A unique number relating information to bridge and bridge spans.

MCC Material Composition Category Composition material, excluding surface material.

YLN Length of Greater Precision (decimeters) A measurement of the longer of two linear axes capable of being expressed in decimal meter units. In this product units will be in decimeters (0.1 m).

AQ058 Constriction/Expansion A point where a passage way narrows or expands beyond its width.

TUC Transportation Use Category Identifies the primary user, function, or authority of the transportation system. (This attribute is used distinguish drop gate features.)

WD1 Minimum Travelled Way Width (decimeters) Minimum width of the travelled way, excluding pavements and hard shoulders. In this product units will be in decimeters (0.1 m).

AQ070 Ferry Crossing A route in a body of water where a ferry crosses from one shoreline to another.

MIL-PRF-89040A

APPENDIX A

ACC Accuracy Category Accuracy of the relative geographic position.

TUC Transportation Use Category Identifies the primary user, function, or authority of the transportation system.

AQ118 Sharp Curve A curve which may cause transportation restrictions.

AQ130 Tunnel An underground or underwater passage, open at both ends, usually containing a road, canal, railroad or aqueduct.

ACC Accuracy Category Accuracy of the relative geographic position.

EXS Existence Category The state or condition of the feature.

LEN Length/Diameter (meters) A measurement of the longer of two linear axes. For a square feature, measure either axis. For a round feature, measure the diameter. For a bridge, the length in the distance between its abutments.

OHC Overhead Clearance Category (decimeters) The least distance between the travelled way and any obstruction vertically above it. In this product units will be in decimeters (0.1 m).

TUC Transportation Use Category Identifies the primary user, function, or authority of the transportation system.

WD1 Minimum Travelled Way Width (decimeters) Minimum width of the travelled way, excluding pavements and hard shoulders. In this product units will be in decimeters (0.1 m).

BH070 Ford A shallow place in a body of water used as a crossing.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

A.6.3.6 Vegetation coverage. The Feature Class Schema table creates the relationship between the feature and primitive tables as shown in TABLE 85. This coverage contains various types of vegetation in a land use and land cover classification scheme as related to military applications. Selected water bodies and urban areas are delineated as a separate feature class in this coverage. Feature and Feature Class Attribute tables are presented in TABLES 86 thru 89. The value description tables for the Vegetation coverage are provided in TABLES 90 and 91. Generally

MIL-PRF-89040A
APPENDIX A

the minimum size for portrayal of a vegetation polygon is 50,000 square meters (50 m by 1000 m).

A.6.3.6.4 Vegetation coverage glossary.

AREA FEATURES

AL020 Built-Up Area An area containing a concentration of buildings and structures.

BH090 Land Subject to Inundation An area periodically covered by flood water, excluding tidal waters.

BH095 Marsh/Swamp A saturated area, at times covered by water, supporting vegetation which may include trees.

BUD Brush/Undergrowth Density Code Density of undergrowth or brush.

DMT Density Measure (% of Tree/Canopy Cover) Canopy cover measured by percent within area of feature during the summer season (leaves-on condition).

VEG Vegetation Characteristics Type of plant or plantings.

MIL-PRF-89040A
APPENDIX A

BH135 Rice Field An area periodically covered with water used for growing rice.

FTC Farming Type Category Type of field pattern.

DA020 Barren Ground Land surface void of vegetation or other specific surface materials.

EA010 Cropland An area that has been tilled for the planting of crops.

FTC Farming Type Category Type of field pattern.

VEG Vegetation Characteristics Type of plant or plantings.

EA040 Orchard/Plantation An area covered by systematic planting of trees which yield fruits, nuts, or other products.

BUD Brush/Undergrowth Density Code Density of undergrowth or brush.

DMT Density Measure (% of Tree/Canopy Cover) Canopy cover measured by percent within area of feature during the summer season (leaves-on condition).

PHT Predominant Height (meters) Height of 51% or more of the feature. If not obtainable, then the average height of the feature will be used.

SDS Stem Diameter Size (centimeters) The average stem diameter in a stand, measured at a height of 1.4 meters above the ground. Unit of measurement is in centimeters (0.01 m).

TSC Tree Spacing Category (decimeters) The average distance from the center of one tree to center of the nearest tree in a stand. Unit of measurement is in decimeters (0.1 m).

VEG Vegetation Characteristics Type of plant or plantings.

EA050 Vineyards An area covered by the systematic planting of grape vines. In this product hops are represented in this category.

EB010 Grassland An area composed of uncultured plants which have little or no woody tissue.

VEG Vegetation Characteristics Type of plant or plantings.

EB020 Scrub/Brush Low-growing woody plants.

VEG Vegetation Characteristics Type of plant or plantings.

EC010 Bamboo/Cane Woody, treelike grass.

EC030 Trees Woody-perennial plants, having a self-supporting main stem or trunk.

BUD Brush/Undergrowth Density Code Density of undergrowth or brush.

DMT Density Measure (% of Tree/Canopy Cover) Canopy cover measured by percent within area of feature during the summer season (leaves-on condition). In this product default values represent ranges.

PHT Predominant Height (meters) Height of 51% or more of the feature. If not obtainable, then the average height of the feature will be used. For this product default values will represent ranges.

MIL-PRF-89040A
APPENDIX A

SDS Stem Diameter Size (centimeters) The average stem diameter in a stand, measured at a height of 1.4 meters above the ground. Unit of measurement is centimeters (0.01 m).

TSC Tree Spacing Category (decimeters) The average distance from the center of one tree to center of the nearest tree in a stand. Unit of measurement is decimeters (0.1 m).

VEG Vegetation Characteristics Type of plant or plantings.

SA010 Common Open Water An area containing any surface water that is flowing or free standing such as lakes, rivers, oceans, reservoirs, etc.

ZD012 Geographic Information Point A location where geographic information or statistics may apply. (A feature of military significance and not captured by any other FACC code).

TXT Text Attribute Narrative or other description.

APPENDIX A

A.7.2 Description of attributes. In cases where a feature has associated attributes whose values are null or unknown, a standard convention will be used to code the values. Null values will be assigned per VPF rules (refer to MIL-STD-2407, section 5.5), which will vary according to the field type. TABLE 94 contains valid FACC attributes and their range of values in TADS libraries. Additional attributes used to describe coverage feature tables may be found in Appendix A, Section 6.

TABLE 94. FACC attributes, VPF format, range, unknown and null values for TADS.

FACC Attribute	Attribute Name (unit of measure)	VPF Field Type	Field Size in Bytes	Range		Unknown	Null
				Min	Max
