w/INT. AMENDMENT 3

24 October 2007

MIL-A-18001K

16 December 1991

DETAIL SPECIFICATION

ANODES, SACRIFICIAL ZINC ALLOY

This specification is approved for use by all Departments and Agencies of the Department of Defense.

1. SCOPE

1.1 Scope. This specification covers the requirements for zinc anodes (galvanic protectors) in the form of plates, slabs, discs, and rods for corrosion protection (cathodic protection) of metals and alloys. It also includes features of anode design and fabrication, such as cast-in cores for mounting purposes. The material described by this specification contains elements for which the Occupational Safety and Health Administration (OSHA) has set standards for exposure limits. Handling, storage, and application of this material should be in accordance with the 29 CFR 1910 and 1915 and any other safety and health regulations (local or otherwise) which may apply.

1.2 Classification. The anodes are of the following classes, types, and styles, as specified (see 6.2).

1.2.1 Class 1 – cast-in cores.

Type ZHS – Zinc, hull slab (steel straps) (23- and 42-pound sizes).

Type ZHB – Zinc, hull slab (brass straps) (23-pound size).

Type ZHC – Zinc, hull slab (core straps) (23- and 42-pound sizes).

Type ZSS – Zinc, submarine slab (steel strap) (12- and 24-pound sizes).

Type ZTS – Zinc, teardrop shape (steel strap) (5-pound size).

Type ZEP – Zinc, fairwater slab (pipe core or pipe bushing core).

Style A – Square slab (9-pound size).

Style B – Circular slab (various sizes).

Style C – Semi-circular slab (23-pound size).

Type ZBP – Zinc, bar (pipe core) (8-pound size).

Type ZBS – Zinc, bar (steel straps) (8.5-pound size).

Type ZDM – Zinc, segmented disc (machine-formed interlocking core).

Type ZMP – Zinc, mooring chain (pipe core or pipe bushing core) (various sizes).

Comments, suggestions, or questions on this document should be addressed to: Commander, Naval Sea Systems Command, ATTN: SEA 05S, 1333 Isaac Hull Avenue, SE, Stop 5160, Washington Navy Yard DC 20376-5160 or emailed to CommandStandards@navy.mil, with the subject line "Document Comment". Since contact information can change, you may want to verify the currency of this address information using the ASSIST Online database at <https://assist.dla.mil>.

MIL-DTL-18001L

1.2.2 Class 2 – plain, no cores.

Type ZRN – Zinc, rod, no core, extruded, drawn or rolled.

Type ZPN – Zinc, plate, no core, rolled.

1.3 Key to symbols. The letter designations for the types of anodes are shown in [table I.](#)TABLE I. Letter designations of anode types.

First letter (designates anode metal)	Second letter (designates shape or general use)	Third letter (designates core)
Z - (zinc)	H - (hull slab)	B - (brass straps)
	S - (submarine slab)	S - (steel strap)
	T - (teardrop shape)	C - (core strap)
	E - (fairwater slab)	P - (pipe core)
	R - (rod, cylindrical)	M - (machine-formed interlocking core)
	P - (plate)	N - (no core)
	B - (bar, square)	
	D - (disc, segmented)	
	M - (mooring chain)	

2. APPLICABLE DOCUMENTS

2.1 General. The documents listed in this section are specified in sections 3, 4, or 5 of this specification. This section does not include documents cited in other sections of this specification or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, or 5 of this specification, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

FEDERAL SPECIFICATIONS

QQ-B-639 - Brass, Naval: Flat Products (Plate, Bar, Sheet, and Strip)

FEDERAL STANDARDS

FED-STD-H28 - Screw-Thread Standards for Federal Services

FED-STD-H28/7 - Screw-Thread Standards for Federal Services Section 7 Pipe Threads, General Purpose

(Copies of these documents are available online at <http://quicksearch.dla.mil/> or <https://assist.dla.mil/>.)

2.2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. REQUIREMENTS

3.1 Materials.

3.1.1 Zinc. The anodes shall conform to the composition specified in [table II](#) as determined by the methods specified herein (see 4.3.3). Total of elemental constituents not specified in [table II](#) shall not exceed 0.10 percent.

MIL-DTL-18001L

TABLE II. Chemical composition, zinc anodes.

Element	Weight (percent)
Lead	<0.006
Iron	<0.005
Cadmium	0.025 – 0.07
Copper	<0.005
Aluminum	0.1 – 0.5
Zinc	>99.414

3.1.2 Steel straps and pipe. Type ZHS, ZHC, ZSS, ZBS, and ZTS anodes shall have steel strap cores conforming to ASTM A36/A36M or BS EN 10025-1. Type ZEP and ZBP anodes shall have steel pipe cores conforming to ASTM A524 or BS EN 10305-1. Type ZMP anodes shall have steel pipe cores conforming to ASTM A524 and ASTM A513/A513M. Hot dip or electrodeposition methods may be used. Either coating shall be adherent and free from flaking. The coating shall adhere tenaciously to the surface of the base metal (see 4.3.3.5).

3.1.3 Brass straps. Type ZHB zinc anodes shall have brass strap cores conforming to Alloy 482 of QQ-B-639 or phosphor bronze straps conforming to Composition A of ASTM B139/B139M. The brass or bronze straps shall be coated with zinc to a minimum thickness of 0.0005 inch (0.0127 millimeter) (see 4.3.3.5). The maximum copper content in the zinc, as specified in [table II](#), may be increased to 0.020 percent for Type ZHB anodes.

3.1.4 Steel machine-formed interlocking cores. Type ZDM zinc anodes shall have machine-formed interlocking cores conforming to commercial grade mild or leaded steel. The cores shall be flash coated with zinc, tin, or aluminum prior to assembly within the zinc anodes.

3.1.5 Recycled, recovered, or environmentally preferable materials. Recycled, recovered, or environmentally preferable materials should be used to the maximum extent possible, provided that the material meets or exceeds the operational and maintenance requirements, and promotes economically advantageous life cycle costs.

3.1.6 OSHA standards. The material described by this specification contains elements for which the Occupational Safety and Health Administration (OSHA) has set standards for exposure limits. Handling, storage, and application of this material should be in accordance with the most recent 29 CFR 1910 and 1915 and any other safety and health regulations (local or otherwise) which may apply.

MIL-DTL-18001L

3.2 Manufacture.

3.2.1 Type ZHS, ZHB, and ZHC, hull slab anodes (see [figures 1, 2, and 7 through 10](#)), types ZSS, submarine slab anode, type ZBS, zinc bar steel strap anode, and ZTS, teardrop anodes (see [figures 4 through 7 and figure 22](#)). Type ZHS, ZHB, ZHC, ZSS, ZBS, and ZTS anodes shall be manufactured by any casting process provided the anodes meet the other requirements covered by this specification. Open or closed molds may be used. Cores and straps shall be positioned so that they are embedded $\frac{1}{4}$ inch $-\frac{1}{16}$ inch or $+\frac{1}{8}$ inch (6.35 millimeters -1.58 millimeters or $+3.175$ millimeters) as shown on [figures 1 through 11](#) which may be measured from either surface of anode as applicable, except [figure 5](#), which shall be embedded $\frac{3}{8}$ inch $-\frac{1}{16}$ inch or $+\frac{1}{8}$ inch (9.525 millimeters -1.58 millimeters or $+3.175$ millimeters) and [figure 22](#), which shall be embedded $.86$ inch $\pm\frac{1}{8}$ inch (21.8 millimeters ± 3.3 millimeters). A metallurgical bond shall be obtained between the zinc and the strap when tested as specified in 4.3.1.3 or 4.3.1.4. Type ZHC anodes, designated as shown on [figures 9 and 11](#), are intended for use with rubber washers for submarine application. Countersinks for rubber washers shall be cast or machined. Anode shall be manufactured so that the countersink is centered on the core hole. Type ZSS anodes, designated as shown on [figures 4 through 6](#), and type ZBS anode as shown on [figure 22](#), may be mounted by welding or by fasteners. Those intended to be attached by fasteners shall indicate the requirements for mounting holes in the strap. The mounting hole shall be counterbored on the structure side of the strap.

3.2.2 Type ZEP, fairwater slab anode, and type ZMP, mooring chain anode (see [figures 12 through 20 and figure 28](#)). The pipe core inserts shall conform to 3.1.2. A sound metallurgical bond shall be obtained between the core and anode material for at least 30 percent of the total surface of the core in contact with the anode when tested as specified in 4.3.1.3 or 4.3.1.4. The position of the pipe core insert shall not vary more than $\pm\frac{1}{8}$ inch (3.175 millimeters) from center as shown on [figures 12 through 20 and figure 28](#).

3.2.3 Type ZBP, zinc bar anode (see [figure 21](#)) and type ZBS, zinc bar steel strap anode. The position of the pipe core and steel strap insert specified in 3.1.2 shall not vary more than $\pm\frac{1}{4}$ inch (6.35 millimeters) from the center as shown on [figure 21 and figure 22](#). The metallurgical bonding requirements between anode and core specified in 4.3.1 shall apply.

3.2.4 Types ZPN and ZRN anodes (no core) (see [figure 23](#)). Type ZPN and ZRN anodes (no core) shall be manufactured by any process provided the anodes pass the tests demonstrating mechanical properties (see 3.6) and other requirements covered by this specification.

3.2.5 Type ZDM, zinc segmented disc, machine-formed interlocking core anode (see [figures 24 through 27](#)). Metallic bonding or an interference fit of the core into the anode shall be required so that an axial force applied from the stud end to remove the core insert is a minimum of 750 pounds (340 kilograms).

3.2.5.1 Core insert. The machine-formed core insert specified in 3.1.4 shall be manufactured in accordance with details and tolerances shown in FED-STD-H28 and FED-STD-H28/7. This core insert has been designed for mass production by modern machine methods. The insert consists of an integral piece having a threaded male stud at one end and a tapped hole at the other end. Provision has been made to achieve self-locking characteristics to interlocking threaded assemblies of multiple segmented anode discs by interference fit of bottom male threads into a taper tapped hole. These anodes shall screw together very snugly by hand tightening or by using simple hand tools, such as pliers or pipe wrenches.

3.3 Dimensions. Anode dimensions shall be as specified on [figures 1 through 30](#) (see 4.2.2).

3.3.1 Types ZHS, ZHB, ZHC, ZTS, ZSS, ZBS, ZEP, ZBP, ZDM, ZRN, and ZMP anodes. The specified anodes shall conform to the dimensions shown on [figures 1 to 28](#), inclusive. Dimensions are in inches unless otherwise indicated on the figure.

3.3.2 Type ZPN anodes. Type ZPN anodes shall be 48 inches (1219.2 millimeters) in length by 24 inches (609.6 millimeters) in width. Thickness of Type ZPN anode shall be either 0.5 or 1 inch (12.7 or 25.4 millimeters), as specified (see 6.2).

3.3.3 Weight. Minimum weight requirements are specified on [figures 1 through 30](#). The total weight of the specified type of anode received divided by the total number of anodes of that type shall be equal to or greater than the minimum weight of anode type specified (see 4.2.2).

MIL-DTL-18001L

3.4 Permissible variation in dimensions.

3.4.1 Length and width of types ZHC, ZHB, ZHS, ZTS, ZPN, ZSS, ZBS, and ZBP anodes. The width and length of the zinc alloy on Types ZHC, ZHB, ZHS, ZTS, ZPN, ZSS, ZBS, and ZBP anodes shall not vary more than $\pm\frac{1}{8}$ inch (3.75 millimeters), measured at the widest surface of the tapered (for mold release) anode.

3.4.2 Length of type ZRN anodes. A variation of ± 0.25 inch (6.35 millimeters) will be permitted based on nominal lengths of 3 and 6 feet (0.91 and 1.83 meters).

3.4.3 Diameter of types ZEP, ZDM, and ZRN anodes. The diameter or width, whichever is the larger, of Type ZEP anode shall not vary from the specified dimension by more than $\pm\frac{1}{8}$ inch (3.175 millimeters). The diameter of the Type ZDM anode shall not vary more than +0.025 or -0.005 inch (+0.635 or -0.127 millimeter) from the specified diameter. The diameter of the Type ZRN anode shall not vary more than $\pm\frac{1}{32}$ inch (0.79 millimeter) from the specified diameter.

3.4.4 Thickness. The thickness of Types ZHS, ZHB, ZHC, ZTS, ZPN, ZSS, ZBS, ZEP, and ZBP zinc anodes shall not vary more than $\pm\frac{1}{8}$ inch (3.175 millimeters). Except for Type ZEP anodes, thickness measurements shall be taken at random 1 inch (25.4 millimeters) from any edge of the anode by means of a suitable caliper, avoiding any surface irregularities which would interfere with a representative measurement. Type ZEP anode thickness measurements shall be taken at random, a distance from the edge of approximately one-half the radius of the anode. The thickness of Type ZDM anode shall not vary more than $\pm\frac{1}{64}$ inch (0.397 millimeter).

3.4.5 Eccentricity of core in type ZDM anode. The cores of Type ZDM anode shall be positioned axially and concentrically in the zinc disc. Eccentricity greater than 0.005 inch (0.127 millimeter) shall not be permitted.

3.4.6 Stud hole elongation for type ZSS and ZBS anodes. When specified (see 6.2), Type ZSS and ZBS straps may be modified as shown on [figure 6](#).

3.5 Marking of anodes.

3.5.1 Marking. The zinc anodes, Types ZHS, ZHB, ZHC, ZSS, ZBS, ZBP, ZMP, ZTS, ZEP, and ZPN shall have the anode type and the words "DO NOT PAINT" die-stamped or cast on the exposed face of the anodes (see [figures 1](#) through [22](#) and [28](#) through [30](#)). No marking shall be required for Types ZDM, and ZRN zinc anodes. For Type ZMP, the nominal anode size shall be marked as specified on [figure 28](#).

3.5.1.1 Type ZHB anode markings. One end of each cast-strap of each Type ZHB anode shall be painted red so that the installing activity can distinguish it from Type ZHS anodes. One coat of red paint shall be applied between the jogged bevel of the strap and zinc anode. The coating shall be approximately $\frac{1}{2}$ inch (12.7 millimeters) wide and shall extend across one side of each strap so as to be readily visible when the anode is installed. The foot of the strap shall not be painted.

3.5.2 Heat identification. Each anode shall be cast or die-stamped with the following: manufacturer's symbol, unique non-recurring heat number specific to production lot (see 4.2.1), and the capital letter corresponding to the revision letter of the military specification to which the anode conforms. (For this specification issue, the letter "L" should be used.)

3.6 Mechanical properties.

3.6.1 Fracture or cracking. When tested in accordance with 4.3.3.3, Type ZRN rods and Type ZPN plates shall not fracture or show signs of cracking.

3.6.2 Torsional shear strength. When tested in accordance with 4.3.3.4, Type ZRN anodes shall have a minimum torsional shear strength of 12,000 pounds per square inch (lb/in²) [8,437,000 kilograms per square meter (kg/m²)].

MIL-DTL-18001L

3.7 Workmanship.

3.7.1 Zinc. The zinc anodes shall be free of flash burrs, cracks, blow holes, pipes, and surface slag consistent with good commercial practice (see 4.2.2). The cast anodes shall be free of shrinkage cavities exceeding $\frac{1}{4}$ inch (6.35 millimeters) in depth, except that anodes 2 inches (50.8 millimeters) thick or more shall be free of shrinkage cavities exceeding $\frac{3}{8}$ inch (9.53 millimeters) in depth, when measured from a straight edge placed diagonally across the opposite edges of the anode. For Type ZPN anodes, the shrinkage cavities shall be measured over a 12- by 12-inch (304.8- by 304.8-millimeter) area. In addition to the above allowable shrinkage cavities, surface irregularities of the anode exceeding $\frac{1}{8}$ inch (3.18 millimeters) in depth shall not be permitted on one face of slab or disc type anodes unless at least $\frac{1}{8}$ inch (3.18 millimeters) of sound metal covers the entire strap of core area. Types ZDM, and ZRN anodes shall be smooth on their curved surfaces.

3.7.2 Metal cores. Metal cores extensions from the anodes shall be smooth and free of sharp burrs. The cast-in cores shall have metallurgical bonds specified herein free of air pockets and inclusions consistent with good commercial practice.

4. VERIFICATION

4.1 Conformance inspection. Conformance inspection shall include the examinations of 4.2 and the tests of 4.3.

4.1.1 Lot. For the purpose of sampling, a lot shall consist of all zinc anodes of the same class and type, poured or cast from one homogeneous heat or melt of a single charge or raw materials. The addition of any material to the heat or melt at any time constitutes a new lot.

4.2 Visual and dimensional examination. Each anode selected in accordance with 4.2.1 shall be examined for conformance to requirements of 3.3 through 3.7. If any anodes do not conform to 3.3 through 3.7, it shall be cause for rejection of the entire lot.

4.2.1 Sampling for visual and dimensional examination. As a minimum, a sample quantity of anodes shall be selected from each lot in accordance with [table III](#). If one or more defects are found in any sample, the entire lot shall be rejected. The contractor has the option of screening 100 percent of the rejected lot for the defective characteristic(s) or providing a new lot which shall be inspected in accordance with the sampling plan provided herein.

4.2.2 Examination procedure. Anodes selected in accordance with 4.2.1 shall be measured for weight and dimension, and be visually inspected at 10 times the magnification for workmanship. No cracks with a surface length greater than $\frac{1}{8}$ inch (3.175 millimeters) shall be allowed. The entire lot of each type anode shall meet the weight requirements as specified in 3.3.3. If the weight is less than the minimum weight for the type of anode specified, it shall be cause for rejection of the entire lot.

MIL-DTL-18001L

TABLE III. Sampling for visual and dimensional examination.

Lot size	Sample size	Accept	Reject
2 – 25	3	0	1
26 – 50	5	0	1
51 – 90	6	0	1
91 – 150	7	0	1
151 – 280	10	0	1
281 – 500	11	0	1
501 – 1200	15	0	1
1201 – 3200	18	0	1
3201 – 10,000	22	0	1
10,000 and over	29	0	1

4.3 Tests. The following tests shall be performed.

4.3.1 Core bonding test. One of the following core bonding tests (4.3.1.3 or 4.3.1.4) shall be performed on each anode selected in accordance with 4.3.1.1.

4.3.1.1 Sampling for core bond tests. From each lot specified in 4.1.1, two anodes shall be selected at random of Types ZHS, ZHB, ZHC, ZSS, ZBS, ZTS, ZEP, ZMP, and ZBP and five anode discs of Type ZDM for the test specified.

4.3.1.2 Resampling. In cases where one of the two anodes tested failed to pass the core bond test, four additional anodes may be selected for retest at the direction of the manufacturer.

4.3.1.3 Core bonding test procedure. Each anode selected to represent the lot shall be cut along the axis of each strap or core, and the cut surface shall be ground reasonably smooth. These surfaces shall be polished with a 240-mesh emery abrasive until the zinc-strap interface is distinctly visible. At least 30 percent of this interface shall show no separation when examined at approximately 10 times the magnification. Zinc anodes may have a bead or buttress projecting from the anode edge along the strap not exceeding ¼ inch (6.35 millimeters). Less bond between core and zinc than specified herein shall be cause for rejection of the lot.

4.3.1.4 Alternate core bonding test. Using any suitable method, the cores shall be torn from each anode selected to represent the lot. The use of a sledge hammer to break the zinc away from the cores has been found to be satisfactory. The area showing bond shall be established by visual inspection of the portion of the cores which were contained within the anode. The metallurgical bond between the zinc and the core shall be at least 30 percent of the total surface area of each core in contact with the zinc of the anode. For the purpose of determining the surface area of the encased core in the anode, marks shall be scribed on the strap around the periphery of each anode at locations where the straps protrude from the anode. The total area of the strap shall be computed between the scribe marks. The surfaces shall have a smooth grey matte finish where bonding has been adequate and either a shiny metallic or rough, dark, or discolored finish where bonding has been inadequate. Both core and zinc mating surfaces shall be examined. Less bond between core and zinc than that specified herein shall be cause for rejection of the entire lot.

4.3.1.5 Type ZDM anode. A minimum steady pressure of 750 pounds (340 kilograms) from a hand-operated pen press applied axially shall be required to remove the core from the anode.

4.3.1.6 Sample anodes. Sample anodes shall be discarded and not included in the delivery of material after the core bond tests are performed. The remaining lengths of ZRN and ZPN anodes may be included in the delivery of material after the physical tests of 4.3.3. Sampling for chemical analysis, as specified in 4.3.2.1, shall be made prior to discarding the anodes specified in 4.3.1.3 through 4.3.1.5.

MIL-DTL-18001L

4.3.2 Chemical analysis. The chips selected in accordance with 4.3.2.1 shall be analyzed to determine conformance with 3.1.1. A strong magnet shall be used to remove any iron contamination picked up during the preparation of the chips. The chips shall be washed in an iron-free degreasing solvent prior to analysis. If any sample does not conform to the chemical composition specified in [table II](#), it shall be cause for rejection of the lot represented by the sample.

4.3.2.1 Sampling for chemical analysis. Anodes shall be taken from each homogenous lot to verify compliance with the chemical requirements of 3.1.1 and [table II](#). As a minimum, the first, middle, and last poured anode shall be tested to verify compliance with the chemical requirements of 3.1.1 and [table II](#). The drilling for sampling for chemical analysis shall be made with a special nonferrous drill bit. See 4.3.2.7, 6.5.1, and 6.5.2 for sample preparation and drilling procedure. From each of the required anodes, one 2-ounce sample shall be taken by drilling or machining the material at the locations specified in 4.3.2.2 to 4.3.2.7, inclusive. The drill or tool bit shall not penetrate into the core material of the cored type anodes. The drilled or machined anodes may be included in the delivery of the material, except Type ZDM which shall be discarded.

4.3.2.2 Drilling locations. Type ZHS and ZHB anodes shall be drilled or machined at locations about 2 to 5 inches (50.8 to 127 millimeters) from the short edge as appropriate to keep away from the encased core.

4.3.2.3 Drilling precautions. Type ZSS, ZBS, ZHC, and ZTS anodes shall be drilled or machined at points not greater than ½ inch (12.7 millimeters) from the long edge.

4.3.2.4 Drilling points for types ZEP, ZMP, and ZBP. Type ZEP, ZMP, and ZBP anodes shall be drilled at points midway between the outer edge of the core and the edge of the anode.

4.3.2.5 Type ZDM samples. Type ZDM anodes shall have a sufficient number of discs machined or drilled to make two 4-ounce quantities. Type ZDM anodes shall be machined or drilled at the outer surface to a depth not exceeding ¼ inch (6.35 millimeters).

4.3.2.6 Surface chips. One 2-ounce sample for each anode specified in 4.3.2.1 shall be taken at the surface in contact with mold wall by drilling or machining to a maximum depth of ¼ inch (6.35 millimeters). The sample for Types ZPN and ZRN shall be taken by drilling completely through both larger surfaces or through the diameter of the anode, as applicable. The samples shall be collected in individual clean containers, and properly labeled as to lot, melt, and sample numbers. Sample chips may be taken from anodes which have passed the applicable bond test. Samples shall be clean and free from dirt, oil, grit, and foreign matter. The samples shall be sent to a laboratory acceptable to the contracting agency. A method for sampling anodes for chemical analysis is specified in 6.5.

4.3.2.7 Determination of aluminum, cadmium, copper, iron, and lead. The aluminum, cadmium, copper, iron, and lead content of zinc shall be determined in accordance with the appropriate methods in ASTM E536 using the atomic absorption, inductively coupled plasma, or directly coupled plasma spectrophotometers.

4.3.2.8 Spectrochemical analysis. Spectrochemical analysis shall be in accordance with any standard method approved by a standard issue body, such as the American National Standards Institute or ASTM E536, and accepted by the Government.

4.3.3 Physical tests.

4.3.3.1 Sampling for physical testing. At least five Type ZRN and five Type ZPN anodes shall be selected at random from a lot. Type ZRN anodes shall conform to the tests specified in 4.3.3.3 and 4.3.3.4. Type ZPN anodes shall conform to the test specified in 4.3.3.3.

4.3.3.2 Physical test sample dimensions for ZPN type anodes. Type ZPN test samples shall be cut from the plate anodes and shall be of the following dimensions:

- a. Width: Twice the thickness of the anode.
- b. Length: 12 inches (304.8 millimeters) (or to suit test apparatus).

MIL-DTL-18001L

4.3.3.3 Bend test. Type ZRN anodes, selected in accordance with 4.3.3.1, shall be bent 45 degrees around a mandrel that has a diameter of three times the thickness of the Type ZPN anode. Type ZPN anodes, selected in accordance with 4.3.3.2, shall be bent 45 degrees around a mandrel of three times the diameter of Type ZPN anodes. The anodes shall be bent in accordance with procedures specified in ASTM E290. After bending, the convex surface of the specimens shall be inspected for cracking by visual examination. Any evidence of cracking shall represent failure of the test and shall be cause for rejection of the entire lot.

4.3.3.4 Torsional shear test. Type ZRN anodes, selected in accordance with 4.3.3.1, shall be subjected to torsional shear at a rate of 10 to 12 revolutions per hour using a Tinius-Olson torsional shear apparatus, or equal. Failure of the anode to withstand a torsional shear of 12,000 lb/in² (8,437,000 kg/m²) shall be cause for rejection of the lot.

4.3.3.5 Steel strap/pipe core coating test. When the coating is cut or pried into, such as with a stout knife applied with considerable pressure in a manner tending to remove a portion of the coating, it shall only be possible to remove small particles of the coating by paring or whittling, and it shall not be possible to peel any portion of the coating so as to expose the steel. Lack of adhesion of the zinc coating at bend or absence of zinc coating at cut edges shall not be cause for rejection of fabricated anodes. Cracks in the base metal shall be cause for rejection.

5. PACKAGING

5.1 Packaging. For acquisition purposes, the packaging requirements shall be as specified in the contract or order (see 6.2). When packaging of materiel is to be performed by DoD or in-house contractor personnel, these personnel need to contact the responsible packaging activity to ascertain packaging requirements. Packaging requirements are maintained by the Inventory Control Point's packaging activities within the Military Service or Defense Agency, or within the military service's system commands. Packaging data retrieval is available from the managing Military Department's or Defense Agency's automated packaging files, CD-ROM products, or by contacting the responsible packaging activity.

6. NOTES

(This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.)

6.1 Intended use. The anodes are primarily intended for use in corrosion prevention in seawater of surface ship and submarine hulls, steel and aluminum equipment and structures, sea chests, sonar domes, mooring chains, and the seawater side of condensers and other heat exchangers. The anodes may also be used for corrosion prevention of pipe lines and other installations underground. The use of a particular anode is determined by the nature and geometry of the structure to be protected. Refer to applicable installation instructions for types, amounts, locations, and mounting of anodes.

6.2 Acquisition requirements. Acquisition documents should specify the following:

- a. Title, number, and date of this specification.
- b. Class and type (see 1.2).
- c. As required, the specific issue of individual documents referenced (see 2.2.1, 2.2.2, and 2.3).
- d. Style of Type ZEP, diameter of Type ZEP (Style B), pipe core size ($\frac{3}{8}$ inch or $\frac{1}{2}$ inch); size of Type ZMP (see [figure 27](#)); diameter of Type ZDM (see [figures 23](#) to [26](#)); diameter of Type ZRN required (see [figure 23](#)); Type ZHC, ship or submarine usage with neoprene washers (see [figures 7](#) to [10](#)).
- e. Thickness of Type ZPN anode, whether $\frac{1}{2}$ or 1 inch (see 3.3.2).
- f. Elongation of Type ZSS and ZBS anode straps (see 3.4.6).
- g. Packaging requirements (see 5.1).
- h. Total number of anodes required (see 6.3).

6.3 Ordering by quantity. The order for anodes should specify the exact number of anodes required (see 6.2). See [table IV](#) for National Stock Numbers (NSN) for each anode type.

MIL-DTL-18001L

6.4 General forms and dimensions. When material is ordered in the form of slabs, bars, discs, or rods, it is to be understood that these terms refer merely to the general form and dimensions of the material, and do not have any technical significance as to the methods of manufacture.

6.5 Sampling procedure.

6.5.1 Drilling procedure. The drilling for chemical analysis should be made with a special nonferrous drill in a clean location (used only for that purpose). The drilling bits should be kept clean of dirt, grit, and other foreign matter; kept properly sharpened; and used only for sampling purposes. After each use, the drilling bit should be immersed in a degreasing solvent and wiped dry with a clean rag. The drilling bits, when not in use, should be stored in an inhibited lubricating oil. The inhibited lubricating oil should be kept in a covered glass container provided with an air vent. The drilling bits should be wiped dry with a clean rag prior to use. Samples should be taken with a dry drill. If automatic power drilling equipment is available, a solid tungsten carbide or Tantung twist drill bit about ½ inch (12.7 millimeters) in diameter is suitable. Where a hand-held power drill is used, the samples should be taken by drilling with a solid tungsten carbide or Tantung twist drill bit about ¼ inch (6.35 millimeters) in diameter. A smaller drill bit may be used where the size of the anode does not permit using the specified diameters. The drills may be used at high speeds and feeds.

6.5.2 Machining procedure. The chips for chemical analysis should be made with a special nonferrous tool in a place which has been cleaned for that specific purpose. Instructions specified in 6.5.1 apply to the use and care of this tool.

6.6 Sub-contracted material and parts. The packaging or preparation for delivery of requirements of referenced documents listed in section 2 do not apply when material and parts are acquired by the contractor for incorporation into the equipment and lose their separate identity when the equipment is shipped.

6.7 Subject term (key word) listing.

Corrosion

Disc

Galvanic

Plate

Rod

Slab
