MIL-STD-1487 1 June 1970

MILITARY STANDARD

GLOSSARY OF CLOTH
COATING IMPERFECTIONS

FSC 8305

DEPARTMENT OF DEFENSE

WASHINGTON, D. C. 20301

Glossary of Cloth Coating Imperfections

MIL-STD- 1487

- 1. This Military Standard is mandatory for use by all Departments and Agencies of the Department of Defense.
- 2. Recommended corrections, additions, or deletions should be addressed to U. S. Army Natick Laboratories (GL), Natick, Massachusetts 01760.

FOREWORD

- 1. The purpose of the standard is to furnish a common vocabulary for use by Government procurement agencies and their contractors. It is designed to fill a need for a glossary of coating imperfections for all coated cloths.
- 2. Defects are likely to occur from many causes such as variation in the quality of the basic materials and variation in manufacturing processes and finishing operations. This standard, however, does not attempt to pin down the cause of the defects but merely to identify the defect in the finished product.
- 3. Contributions by the Coated Fabrics Industries are acknowledged as are comments submitted by agencies that reviewed the draft of the standard. Users are requested to submit to the preparing activity comments, new terms and definitions that are considered applicable to this standard.

1

1. SCOPE

- 1.1 General. This standard establishes definitions for the words, terms and expressions for defects peculiar to the general field of coated cloths.
- 1.2 Application. It is anticipated that this standard will serve as a source of defects in the preparation of visual examination sections of coated cloth specification.
- 1.2.1 This standard is not intended to take the place of a particular in spection procedure aid which may be provided for inspectors to verify conformance with a particular specification. The quality requirements specified in the basic specification are governing.
- 1.2.2 This standard covers only visual defects for coated cloth material, more specifically, defects applicable to the coating and coating material. Defects applicable to the cloth to which coating is applied are covered in FED-STD-4.

FEDERAL

FED-STD-4 - Glossary of Fabric Imperfections

(Copies of specifications, standards, drawings, and publications required by suppliers in connection with specific procurement functions should be obtained from the procuring activity or as directed by the contracting officer).

3. GLOSSARY OF TERMS

3.1 Introduction. Defect terms are arranged alphabetically. Synonymous and similar terms are cross referenced, "See...".

3.2 Definitions.-

Abraded area

-An area of cloth worn away by rubbing or scraping.

Abrasion

-Coating friction worn, reduced in gauge, frequently surface roughed.

Abrasion exposing base

-Coating worn through to base cloth.

cloth

Abrasion mark

-An abraded spot.

Adhesions Air pocket Air streak

Baggy

Bald spot

Bar mark

Bare back

Bare spot Bleeding

Blister

Blocking

Bloom, blooming

Blotchy
Boardy
Brittle coating
Broken edge (selvage)
Build-up in roll

Bruise

Burn Burned gum -See "Blocking".

-See "Blister".

-Streak caused by air trapped between cloth and compound or by air entrapped between calender roll and coating film as applied to cloth. (See "Railroad tracks").

-Waviness in material; inability to lie flat due to distortion of cloth or uneven tension in coating.

-A deficiency of finish in a small area.

-A mark caused when coating machine is stopped or operated with an uneven or jerky motion.

-Surface mark or indentation by the bars of a festooning oven or chamber used for suspension of the coated cloth during vulcanization or similar operation where material is allowed to rest temporarily on a heated bar or pipe, e.g., on heating pipes on spreader steam table.

-A cloth face which is free of any coating or covering.

-Uncoated area in the cloth. See "Bald spot".

-Migration of an ingredient to surface to form an oily film or beads; term usually used for liquid materials. Exudation, sweating.

-Raised bubble or peak-out of surface coat; raised spot or void.

-Tacky, ability to adhere to self; adhesion between touching layers of material. Cloth does not unroll readily.

-Coating compound ingredients surfacing, generally detrimental to adhesion or cementing; blush or discoloration; non-uniform appearance.

-See "Mottled".

-A stiff or tinny effect.

-Cracks when flexed.

-Fractured.

-Uneven thickness of coated cloth roll resulting from curled, doubled, folded or rolled edges or uneven application of coating.

-A scar caused by an uncrued article striking a non-coated object.

-Cloth charred by excessive heat; singe; scorch.
-Coating that has been carbonized or deteriorated

resulting from excessive heat. This condition may also be caused by incompatability of compounding ingredients or improper mixing of compound. Overvulcanization.

Burnt areas
Burnt stock

Double

Doubling crease Dry areas Embedded crease Embedded foreign matter

Excess dusting material Excessive coating

Finish mark Finish run out Finish streak -See "Burned gum".

-Random cured coating particles.

-See "Abrasion mark".

-See "Burned gum".

-See "Burned gum".

-Rough sandpaper finish due to cold stock.

-See "Foreign material".

-Break in coating, usually resulting from a crease.

-See "Burned gum".

-Fissured surface condition.

-Minute cracks.

-A depression in the coating giving the opposite appearance of a blister.

-Fold; pleat; doubling of surfaces that do not adhere to one another and that cannot be corrected by manual pressure.

-Radial lines and marks of pattern indicated by the name.

-Undulated.

-An opening made with a sharp edged object.

-Surface coat removed, scraped, peeled or otherwise taken away from the cloth; separation of coating from base cloth; separation of one cloth; separation of one cloth from another in a plied material.

-Hollow in a surface. See "Crater".

-Small surface depression; collapsed blister.

-Uncleanness.

-Color other than specified, entirely or in part.

-Edges or selvages curled to the extent that material folds on itself.

-A crease folded back on itself.

-Excessive heat applied in vulcanization process.

-A crease permanently set into the material.

-Inclusion; foreign matter which on removal leaves an uncoated, poorly coated area or a through hole.

-Heavy deposit of dusting material.

-Area that has a heavier coating than the surrounding area or characterized by lumps or ridges.

-Finish coat leaves uneven appearance.

-Finish does not cover entire sheet.

-Finish coat applied to surface that leaves streaks.

Fish eye

Flat embossing Folded

Foreign material

Globs Grain depth

Heavily beaded

Hole

Indistinct
Insufficient coating
Light area
Liner impression
Linty

Lump

Luster

Mark-off

Mottled

Not as specified

Not smooth Not straight -Non-uniform release of coating film from calender rolls causing pits in coating surface. (This condition could also be caused by solvents in spreading).

-Embossed finish too smooth.

-Material is bent or pressed so that one part is over another (see "Doubled").

-Any extraneous matter (lint, dirt, grease, etc.).

-See "Lump".

-Too deep, too shallow, uneven. Not in accordance with stated requirement.

-Referring to edges and selvages. Material cannot be rolled in uniform layers.

-An opening of undetermined cause. Area not covered by base cloth and coating compound.

-Finish or grain not clearly evident.

-See "Thin area".

-See "Thin area".

-See "Mark-off".

-Pick off of lint from back of cloth on to surface coating or from lint in atmosphere in coating area.

-An agglomerate of coating compound; undiluted coating stock; imbedded foreign material; surface protrusion usually of the base coating material as distinguished from imbedded foreign material.

-A characteristic of the finish, i.e., the dull-ness, brightness, glossiness of the finish.

-Imprint of the back of material onto the face when the material is rolled.

-Blotchy or spotted appearance of cloth; marble-like appearance caused by undiffused stock feeding into calender bite at the same time.

-When referring to color, shade, finish or not in accordance with stated requirements; does not match standard sample within established color and shade tolerances when standard sample is available.

-Material is rough in appearance or to touch.
-Referring to edges or selvages. Self-descriptive.

h

Not uniform

Objectionable odor

Off shade

Paper picks

Pick-off

Pick-up

Pigmentation missing Pigment streaks Pinch Pinched coating Pinhole -Material varies in width, thickness, color, shade finish or grain.

-Odors of chemicals commonly used in coating compounds shall not be regarded as objectionable. (Choice of curing agents, plasticizers etc. should be such that ordinary odors from such ingredients are minimized to an acceptable degree).

-Not within established shade tolerance, shaded side to side, side to center.

-Particles of paper adhering to film surface. See "Foreign material".

-An area where coating is delaminated from its base and either torn off completely or remaining attached as loose flap. Caused by adherence to calender roll or to back of material in a roll.

-This occurs when an additional substance is picked up from a calender roll or the back of material; opposite of pick-off.

-Poor distribution of pigments.

-Visible streaks of pigment variation in coating.

-A crease where surfaces adhere.

-A ridge or wrinkle in the coating.

-A pinhole is defined as any transparent or semitransparent opening observed in the cloth under through-light 1/ conditions which may or may not be visible when the coated cloth is viewed at the same distance in average daylight or the equivalent thereof; a point presenting an opening large enough to allow penetration of a pinpoint of light in through lighting.

The through-light inspection shall be performed in a darkened area using the lighting table described as follows: The light table shall have a clear glass top and shall be illuminated with a minimum of two 25-watt fluorescent tubes. The tubes shall be positioned 9 to 10 inches below the glass top and 6 to 8 inches from the sides and ends of the light housing. The spacing between tubes shall be 5 to 6 inches and the interior of the light housing shall be white. During the examination when the surface of the coated cloth is in contact with the light table, the illumination in the darkened room shall be 20 + 5 foot candles of natural or artificial

Footnote to "Pinhole" (cont'd)

light. An instrument for measuring light intensity, the Weston Illumination Meter Model 756, or 703, type 8 with viscor filter made by Daystrom, Inc., Weston Industries, Newark, New Jersey.

Piping Pirne barre -Surface distortion. See "Dimple". -Bar marks on fabric side of single coated

Pit Pleat Puckers -A spherical depression, usually small.

-See "Crease".

-Indentations resulting from shrinkage of the cloth. (May also be caused by improper tension or knife dragging during coating).

Railroad tracks

-Depression in surface forming a pattern indicated by the name; dual parallel impressions in warp direction, varying lengths.

Rancid Repair

-Having the bad smell of stale fats or oils. -Material where defect is corrected by patch, sewing or other means.

Ridgy Rip

-Having or rising in a ridge or ridges.

Ripples Rolled

-Cut or torn apart roughly. -Resembling small waves.

Rough surface

-Edges folded over. -See "Not smooth".

Run-out

-Compound does not cover cloth.

Scalloped Scratch Scuff mark Separation Set-up

-Characterized by scallop-like ridges. -Marking or scraping in the material. -Damage to surface due to rough handling.

-See "Delamination".

Sharp

-Uncured coatings that have cured during transit and/or storage.

Skip

-Referring to edges or selvages. Self-descriptive.

Soft coating

-Area of no coating.

Soiled

-Self-descriptive, usually resulting from inadequate curing.

Sparkle

-Spots of foreign material from back of cloth, atmosphere, coating operation or manual

-Bright spots in the finish.

Spliced .

-Two cloths joined together and coating extended over joint.

handling etc. See "Dirty" and "Foreign material".

Spot

-An area of discoloration on the surface of the cloth.

Stain

-See "Spot".

Stitch mark

Stop mark Streak

Strike through

Swirls
Tacky
Tear
Thin area, thin spot,
thinly coated
Tight

Tunnel

Two-tone Uncoated Uneven coating

Uneven dust

Wavy

Weak spot

Wrinkle

Custodians:

Army - GL Navy - SA Air Force - 11

Review activities:

Navy - AS, SA, MC Air Force - 11, 45, 82

User activities:

Army - MD, AV, ME Navy - OS, SH, YD -In spliced cloth, an impression in coating caused by splicing thread.

-Characterized by thin or heavy area.

-A line or long thin mark; stripe or smear, generally differing in color or texture from the surrounding area.

-Coating compound shows through on uncoated side of cloth. Undersirable only if so specified.

-Coating in a swirl pattern.

-Sticky.

-Split; pulled apart. See "Rip".

-Thickness of coating is less than specification requirement. Varies from overall thickness.

-Referring to edges or selvages. Causing curl, puckering or waviness.

-An elongation area between coatings on a multiple coating job or between the cloth and coating.

-Two distinct shades of color.

-No visible coating applied.

-Variation in gauge in same finished coated cloth.

-Dusting material not evenly applied over entire coating.

-Characterized by wave-like appearance. See "Baggy".

-Usually an area where material is missing or undergauge.

-See "Crease".
