DEPARTMENT OF DEFENSE STANDARD PRACTICE

FIBER OPTIC CABLING SYSTEMS REQUIREMENTS AND MEASUREMENTS

(Part 6: PARTS AND SUPPORT EQUIPMENT COMMONALITY AND
STANDARDIZATION REQUIREMENTS)

(PART 6 OF 6 PARTS)

AMSC N/A

FSC 60GP

MIL-STD-1678-6A
w/CHANGE 1

FOREWORD

1. This Department of Defense Standard Practice is approved for use by the DLA Land and Maritime, Defense Logistics Agency, and is available for use by all Departments and Agencies of the Department of Defense.
2. Comments, suggestions or questions on this document should be addressed to DLA Land and Maritime, ATTN: VAT, Post Office Box 3990, Columbus, OH 43218-3990, or emailed to (FiberOpticGroup@dla.mil). Since contact information can change, you may want to verify the currency of this address information using the ASSIST Online database at <https://assist.dla.mil/>.
3. This standard practice provides detailed information and guidance to personnel concerned with ensuring standardization of fiber optic cable topologies (optical fiber cabling and associated components) on military mobile vehicles used in air, land, and sea applications. In general, the requirements and methods specified herein are not identifiable to any specific mobile vehicle class or type, but are intended to standardize and minimize variations in requirements, test setups, test measurement procedures, test sample fabrication configurations, and other aspects that must be addressed for completeness. Where specified, constraints for usage or platform types will be listed. The term "platform" will be used to refer to the military mobile vehicles in general or, where designated, one particular class (such as "aircraft platform") or one particular type within that class (such as "F-35").
4. In order to provide flexibility in the use and update of the different aspects for requirements and methods, this standard practice is issued in six parts; as follows:

MIL-STD-1678-6A
w/CHANGE 1

- Part 1: Design, maintenance and installation requirements. This part addresses design requirements for platforms that use cable harnesses as the means to transport data through optical fiber among communication network and end user equipment. Larger platforms excluding surface ships and submarines that route trunk cables through cableways and drop cables to the end user (application equipment), can cite applicable requirements in Part 1 of the Standard Practice and augment them with use of MIL-HDBK-2051 and MIL-STD-2042 as appropriate. Surface ships and submarines, are to use MIL-HDBK-2051, MIL-STD-2052, and MIL-STD-2042 in lieu of Part 1 of this Standard Practice for all fiber optic applications with the exception of Personnel Proficiency. For Personnel Proficiency, Surface ships and submarines are to use Navy shipboard and application training requirements in requirement 1306 of this Standard Practice.
- Part 2 Optical measurements. Part 2 of this standard addresses further details to refine or bound (constrain) the performance of each optical test measurement addressed. The test methods, such as those in a TIA-455 series standard or military standard/specification, are cited already. This part of the standard practice augments the test method in the standard or specification to ensure consistency with setup and measurement procedure. This consistency minimizes variations when comparing data obtained from different test laboratories (including commercial, vendor, Government, and Government contractor).
- Part 3 Physical, mechanical, environmental and material measurements. Part 3 of this standard addresses further details to refine or bound (constrain) the performance of each physical, mechanical, environmental and material test measurement or inspection addressed. The test methods, such as those in a TIA-455 series standard or military standard/specification, are cited already. This part of the standard practice augments the test method to ensure consistency with setup, measurement procedure, data recording/analysis and other factors critical to conducting or evaluating test performance. This consistency minimizes variations when comparing data obtained from different test laboratories (including commercial, vendor, Government and Government contractor).
- Part 4 Test sample preparation/fabrication requirements. Part 4 of this standard addresses further details to refine or bound (constrain) the preparation and fabrication of test samples for the fiber optic components addressed. Fabrication methods, such as those in the Shipboard installation standard, [MIL-STD-2042](#), or in the general series aircraft maintainer's manual, [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#), are cited already. This part of the standard practice augments the fabrication method to ensure consistency of the test configuration
- Part 5 Design phase, supplemental and legacy measurements. Tests that are more unique to the design phase or tests and inspections that are not just primarily for qualification (supplemental measurements) are addressed in Part 5 of this standard practice. Also, legacy test methods and legacy criteria measurements are provided in this part of the standard practice with the recommended replacement method for the former (legacy) DOD-STD-1678 methods. These former DOD-STD-1678 test methods are listed under the constraint that they be used only with the specific military specifications or commercial standards in which they are cited. The intent is to delete each DOD-STD-1678 test method from that standard practice in Part 5 once its reference from military specification or commercial standard is removed.
- Part 6 Parts and support equipment commonality and standardization requirements. This part of the Standard Practice addresses component part and support equipment standardization requirements for platforms that transport data through optical fiber among communication network and end user equipment. Surface ships and submarines are to use the Navy Shipboard Fiber Optic Recommended Components Parts List, the Navy Shipboard Fiber Optic Recommended Test Equipment List and the Navy Shipboard Fiber Optic Recommended Tools List in addition to part 6 of this Standard Practice. Likewise, larger platforms that route trunk cables through cableways and drop cables to the end user (application equipment), can cite applicable requirements in Part 6 of the Standard Practice, cite the Navy Shipboard Fiber Optic Recommended Components Parts List (with test equipment list and tool list), or both, as appropriate. The Navy Shipboard Fiber Optic Recommended Components Parts List can be obtained at the Navy Shipboard fiber optic website. Due to the dynamic nature of web addresses, the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address. For surface ships and submarines, where there is conflict between the cited documents on the Web Site and Part 6 of this Standard Practice, the three documents on the Web Site shall take precedence.

MIL-STD-1678-6A
w/CHANGE 1

1. SCOPE

1.1 Scope. Part 6 of this standard practice provides detailed commonality and standardization requirements of fiber optic parts and support equipment for platforms that use cable harnesses as the means to transport data through optical fiber among communication network devices and end user equipment.

1.1.1 Applicability. These criteria apply to platforms in which the fiber optic topology (fiber cable plant, local cabling, and components to end used equipment such as WRA – weapons replaceable assembly, LRM – line replaceable module, LRU – line replaceable unit) is in the form of fiber optic harnesses. Larger platforms that route trunk cables through cableways and drop cables to the end user (application equipment), may cite other type cabling components as appropriate in lieu of the cabling in Part 6 of this Standard Practice. Surface ships and submarines, are to refer to MIL-STD-2042 in lieu of Part 6 of this Standard Practice. These criteria are intended primarily for new construction; however, they are also applicable for conversions or alterations of existing platforms. The rapidly changing state of the art in fiber optic technology makes it essential that some degree of flexibility be exercised in enforcing this document. When there is a conflict between this document and the platform specification or contract, the platform specification or contract will take precedence. Where platform design is such that the requirements herein cannot be implemented, users will submit new requirements or modifications of existing requirements to consider for incorporation into this standard practice to: DLA Land and Maritime, ATTN: VAT, Post Office Box 3990, Columbus, OH 43218-3990, or emailed to (FiberOpticGroup@dla.mil).

1.2 Intended uses for Part 6.

1.2.1 Primary use of Part 6. Part 6 of this standard practice was prepared primarily to ensure commonality and standardization (consistency) by listing those fiber optic parts and support equipment found suitable for use and specified in the General Series Technical Manual [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#).

1.2.2 Supplemental use. Part 6 of this standard practice contains information that will be considered during the selection process. Selection of the fiber optic components and support equipment listed herein is intended to reduce the logistics support footprint and total ownership cost.

1.2.3 General constraints on use. Part 6 of this standard practice is not intended to be used in lieu of a Platform Office identifying and specifying parts and support equipment unique to that platform's application.

2. APPLICABLE DOCUMENTS

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard. This section does not include documents cited in other sections of this standard or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE STANDARD

[MIL-STD-1678-1](#) - Fiber Optic Cabling Systems Requirements and Measurements, Part 1: Design, Installation and Maintenance Requirements.

(Copies of these documents are available online at <https://quicksearch.dla.mil/> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/ TM 1-1500-323-24-4](#) - Installation and Testing Practices Aircraft Fiber Optic Cabling.

MIL-STD-1678-6A
w/CHANGE 1

(A copy of this document is available online at: <https://my Natec.navair.navy.mil>. NATEC has three difference processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

2.3 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

LIA/LASER – LASER INSTITUTE of AMERICA

[LIA Z136.2](#) - Safe Use of Optical Fiber Communication Systems Utilizing Laser Diode and LED Sources.

(Copies are available online at <http://www.lia.org> or can be obtained from the LIA - LIA/LASER - Laser Institute of America, 12424 Research Parkway, Suite 125, Orlando, FL. 32826.)

TELECOMMUNICATIONS INDUSTRY ASSOCIATION

[TIA-440](#) - Fiber Optic Terminology.

(Copies are available online at www.tiaonline.org or from Telecommunications Industry Association (TIA), 2500 Wilson Boulevard, Suite 300, Arlington VA 22201.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. DEFINITIONS

3.1 General fiber optics terms. Definitions for general fiber optic terms used in this standard practice are in accordance with TIA440 "except as otherwise specified in 3.1.1 and herein". Definitions for other terms as they are used in this standard practice are given in the following paragraphs.

3.1.1 Standard ization for usage of terms (spelling).

- a. Fiber optic. The word "optic" appears without an "s" when the term "fiber optic" is used as an adjective, such as "fiber optic cable", "fiber optic component". Example of a usage is "The fiber optic system is comprised of fiber optic cable with fiber optic connectors, but without any fiber optic splices."
- b. Fiber optics. The word "optics" appears with an "s" when the term "fiber optics" is used as a noun, such as "fully fiber optics". Example of a usage is "The system is comprised of both wiring media and fiber optics."
- c. Multimode. The word "multimode" appears as one word as opposed to two words or two words separated by a hyphen. Example of a usage is "The cable in the system is comprised of fiber optic, multimode cable."
- d. Single mode. The word "single mode" appears as two words as opposed to one word or two words separated by a hyphen. Example of a usage is "The cable in the system is comprised of fiber optic, single mode cable."

3.2 Acronyms. The following acronyms are used in this standard practice:

ATR	Air transport rack
LRC	Line replaceable component
LRM	Line replaceable module
LRU	Line replaceable unit
MQJ	Measurement quality jumper
OFCS	Optical fiber communication system
SE	Support equipment
WRA	Weapons replaceable assembly

3.3 End user equipment. This equipment is either the source or destination of an optical signal. This equipment can be a cabinet, case, panel, or device. The devices include WRA: Weapons replaceable assembly, LRM: Line replaceable module, and LRU: Line replaceable unit.

3.4 Local cable. A fiber optic cable that runs between end user equipment.

3.5 Part. A fiber optic component or other accessory that comprises a piece of a fiber optic cable harness.

MIL-STD-1678-6A
w/CHANGE 1

3.6 Platform. A military mobile vehicle used in air, land, or sea applications.

3.7 Platform class. A general category of military mobile vehicles such as aircraft, aircraft fixed wing, aircraft rotary, truck, cargo truck, armored assault vehicle, ship, surface ship, or submarine.

3.8 Platform type. A specific military mobile vehicle such as an F-35 under aircraft or DDG-51 under ship.

3.9 Support equipment. Equipment required to maintain, test, or operate an item, or facility, in its intended environment.

4. GENERAL REQUIREMENTS

4.1 Consistent approach throughout the processes for parts and support equipment selection. A consistent approach for this selection shall consist of implementing commonality and standardization throughout the processes of selecting fiber optic parts and support equipment. Fiber optic part and support equipment selection is not isolated by platform and does impact the overall military total ownership cost. Use of a consistent approach will provide increased assurance that a fiber optic system will perform as designed for the life of the system.

4.1.1 Selection considerations. These considerations shall include the use of standardized parts and support equipment contained as standardization requirements in this standard practice. The Approving Activity shall evaluate the parts and support equipment listed and determine suitability for use in the intended application. The Approving Activity shall reevaluate on a case by case basis and add or modify items as the need arises.

4.2 Reduction of total ownership cost. Fiber optic requirements shall be based on total ownership cost. Total ownership cost criteria to incorporate into the requirements shall include:

- a. Use of standard processes and practices as specified in [MIL-STD-1678-1](#).
- b. Use of standard parts as specified in [MIL-STD-1678-1](#) and this Standard Practice.
- c. Use of standard support equipment as specified in this Standard Practice.
- d. Reducing training costs by applying 4.2a and 4.2b into system design as specified in [MIL-STD-1678-1](#) and by applying commonality in use of the parts and support equipment as specified in Part 6 of this Standard Practice.
- e. Reducing logistic support costs by implementing 4.2.a through 4.2c into system design as specified in [MIL-STD-1678-1](#) and by implementing standardization of parts and support equipment as specified in Part 6 of this Standard Practice.
- f. Use practices that improve reliability, maintainability, durability, performance, reducibility, quality, and safety over the entire expected service life of the platform.

(1) Laser safety precautions. The classification of a laser is based on the ability of the optical beam to cause damage to the eye. Under normal operating conditions, the laser diode found in an optical fiber communication system (OFCS) is inherently an eye safe system; but, when an optical fiber connection is broken and optical viewing instruments are used, it is possible that hazardous energy can enter the eye. For this reason, four service group hazard classes have been devised to indicate the degree of hazard and required hazard control measures. Refer to [LIA Z136.2](#) for a full technical definition. Refer to subordinate work package 004 01 of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#) for a laser safety refresher summary.

(2) Fiber optic safety precautions. The fiber optic safety precautions listed in subordinate work package 004 01 of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#) shall apply.

- g. Use practices that ensure interoperability of fiber optic parts and support equipment among platform types and classes.

4.3 Operating wavelength. Unless otherwise specified, the default operating wavelengths in 4.3.1 shall be specified as the standard transmission wavelength for the platform. Where feasible, wavelength of operation shall be standardized for each class of platform (see 3 under foreword).

4.3.1 Default. System shall be designed to operate at a nominal wavelength of 850 nanometers (nm) for multimode optical fibers and at 1,550 nm for single mode optical fibers.

MIL-STD-1678-6A
w/CHANGE 1

4.3.2 Default, shipboard. System shall be designed to operate at a nominal wavelength of 1,300 nanometers (nm) for multimode optical fibers and at 1,310 nm for single mode optical fibers. Other wavelengths of operation may be specified, but are less preferred.

4.4 Consensus of requirements. When specified for commonality, a means shall be determined to reach consensus on standardization of new/revised part and support equipment requirements, identify new requirements and new technologies that permit its rapid introduction, and provide those requirements to update Part 6 of this Standard Practice.

5. DETAILED REQUIREMENTS

5.1 Parts. Requirements for the fiber optic parts shall be implemented as specified in 5.1.1 through 5.1.10.

5.1.1 Multiple termini connector components. Parts shall conform to [Requirement 6101](#).

5.1.2 Cable. Parts shall conform to [Requirement 6102](#).

5.1.3 Epoxies and adhesives. Parts shall conform to [Requirement 6103](#).

5.1.4 Convuluted tubing. Parts shall conform to [Requirement 6104](#).

5.1.5 Backshell, solid, single fiber cables. Parts shall conform to [Requirement 6105](#).

5.1.6 Backshell, split, single fiber cables. Parts shall conform to [Requirement 6106](#).

5.1.7 EMI retention nut. Parts shall conform to [Requirement 6107](#).

5.1.8 Other components for cabling assembly. Parts shall conform to [Requirement 6108](#).

5.1.9 Cable wrap for cable assembly. Parts shall conform to [Requirement 6109](#).

5.1.10 Plastic dust caps. Plastic dust caps shall conform to [Requirement 6110](#).

5.2 Support equipment. Requirements for the fiber optic support equipment shall be implemented as specified in 5.2.6 through 5.2.9.

5.2.1 Ferrule end face consumable cleaning supplies and equipment. Support equipment shall conform to [Requirement 6201](#).

5.2.2 Ferrule end face inspection equipment. Support equipment shall conform to [Requirement 6202](#).

5.2.3 Test and troubleshooting equipment. Support equipment shall conform to [Requirement 6203](#).

5.2.4 Termination equipment. Support equipment shall conform to [Requirement 6204](#).

5.2.5 Optical loss measurement supplemental items. Support equipment shall conform to [Requirement 6205](#).

5.2.6 Connector accessories assembly and repair tools and equipment. Support equipment shall conform to [Requirement 6206](#).

5.2.7 Measurement Quality Jumpers. Measurement Quality Jumpers shall conform to [Requirement 6207](#).

5.2.8 Mechanical splice assembly equipment. Mechanical splice assembly equipment shall conform to [Requirement 6208](#).

5.2.9 Post installation inspection tools. Post installation inspection tools shall conform to [Requirement 6209](#).

5.3 Interface requirements. Interface requirements for parts and support equipment shall be implemented as specified in 5.3.1 through 5.3.3.

5.3.1 Termini retention clip seating tester. Tool shall be constructed to [Requirement 6301](#).

5.3.2 Terminus removal tool interface requirements. Tool shall be constructed to [Requirement 6302](#).

MIL-STD-1678-6A
w/CHANGE 1

5.3.3 Ferrule end face cleaning swab and tool interface requirements. Tool shall be constructed to [Requirement 6303](#).

5.3.4 Polishing puck interface requirements. Tool shall be constructed to [Requirement 6304](#).

5.3.5 Ferrule length gauge interface requirements. Tool shall be constructed to [Requirement 6305](#).

6. NOTES

(This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.)

6.1 Intended use. The fiber optic parts and support equipment depicted in this Standard Practice are intended (were selected) for aircraft applications; however, they are applicable for other types of military mobile vehicles (also identified as platforms) that use cable harnesses as the means to transport data through optical fiber among communication network and end user equipment.

6.2 Acquisition requirements. Acquisition documents should specify the following:

Title, number, and date of this standard practice.

6.3 Subject term (key word) listing.

Fiber optic parts
Fiber optic components
Fiber optic support equipment
Measurement Quality Jumpers (MQJ)

6.4 Supersession data. The first six parts of MIL-STD-1678 replace superseded DOD-STD-1678 with completely new fiber optic requirements and measurements. With the exception of some legacy material in Part 5 of MIL-STD-1678, none of the fiber optic test and measurement material comprising superseded DOD-STD-1678 has been included. With the exceptions noted in Part 5 of this standard practice, this standard practice should be applied in lieu of the legacy methods in superseded DOD-STD-1678. Part 6 of this Standard Practice replaces superseded NAVSEA Drawings 7612821, 7613069, 8283420 and 8329100 for Measurement Quality Jumpers (MQJ), support equipment, Termini retention clip seating tester, and fiber optic parts, respectively.

6.5 Changes from previous issue. The margins of this specification are marked with vertical lines to indicate where changes from the previous issue were made. This was done as a convenience only and the Government assumes no liability whatsoever for any inaccuracies in these notations. Bidders and contractors are cautioned to evaluate the requirements of this document based on the entire content irrespective of the marginal notations and relationship to the last previous issue.

MIL-STD-1678-6A
w/CHANGE 1

PARTS STANDARDIZATION REQUIREMENTS FOR CABLE HARNESS CONFIGURATIONS

(6101 – 6110)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6101

QUALIFIED MULTIPLE TERMINI CONNECTOR COMPONENTS.

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part referred to as the multiple termini connector and components (termini) associated with the connector. This requirement is intended for developmental, prototype, production, rework, and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

- [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three difference processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Components Parts List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optic Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for tools and for test equipment) that may be applicable to the logistic support requirements for the specified component. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6101

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Connector, fiber optic. A device that permits repeated mating and couples the optical power between two optical fibers or two groups of optical fibers. A fiber optic connector must maintain fiber alignment without significant loss of optical power.

3.2 Connector, LC. The Lampert connector or Lucent connector (LC) is a single ferrule connector with a 1.25 mm (.05 inch) ferrule diameter, a push-pull style attachment configuration to the mating an LC-to-LC adapter/patch panel or equipment interface port, and a butt-jointed connector design. The LC connector has a small form factor configuration that has the same footprint as a RJ-45 receptacle.

3.3 Patch cords. Jumpers that transition the cabling from the cable harness to networking equipment or to patch panels. A fiber optic multiple termini connector is on one cable end and single ferrule connectors (such as an LC connector) are on the other end.

4. Requirements. Fiber optic multiple termini connectors shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-4/T.O. 01-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic multiple termini connectors used shall be restricted to those in TABLE 6101 - I. These connectors include those that are a part of a fiber optic cable harness, those on the external surface of end user equipment interfacing with the cable harness, and those on patch cords. [TABLE 6101 - II](#) provides current qualified vendors for the MIL-PRF-29504/4 and MIL-PRF-29504/5 termini used with the MIL-DTL-38999 connector. [TABLE 6101 - III](#) provides unqualified sources for unqualified MIL-PRF-29504/4 and MIL-PRF-29504/5 style 2 termini with metal ferrules (and ruby jeweled inserts). [TABLE 6101-IV](#) provides the part number reference to qualified sources of supply for MIL-PRF-28876 connectors and the MIL-PRF-29504/14 and /15 termini used with the MIL-PRF-28876 connector. Table V shall be used for sources of unqualified MIL-PRF-29504/18 termini (used with the MIL-PRF-64266 connector). Once a source is qualified, the qualified source shall be used in lieu of other sources listed in these tables. [TABLE 6101 - VI](#) shall be used for sources of COTS ruggedized LC connectors. [TABLE 6101-VII](#) shall be used for sources of unqualified MIL-PRF-29504/20 termini. [TABLE 6101-VIII](#) shall be used for sources of COTS ruggedized SC connectors

TABLE 6101 - I. Qualified multiple termini connector components.

Description	MIL-SPEC	QPL

^{1/} Connectors in this column are pull-proof type SC connectors.^{2/} Connectors in this column are non pull-proof type SC connectors.^{3/} For placement on cable with a 1.6 to 2.0 mm outer jacket diameter.^{4/} For surface ships and submarines, use vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Components Parts List, see 2.3.6. Notes.

6.1 Intended use. On these platforms, the fiber optic cable assemblies intended to be inspected include (1) cable harnesses, (2) equipment (electronic module/package) such as a(n) ATR, LRC, LRM or LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6102

SINGLE FIBER CABLE

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part referred to as the cable. Specifically, the type of cable is one that contains one optical fiber per cable. This type cabling may be referred to as single fiber cable, single fiber cabling, or simplex cable. This requirement is intended for developmental, prototype, production, rework, and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

[MIL-DTL-38999](#) - Connectors, Electrical, Circular, Miniature, High Density, Quick Disconnect, (Bayonet Threaded and Breech Coupling), General Specification for.

[MIL-PRF-85045](#) - Cables, Fiber Optics (Metric), General Specification for.

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling.

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three difference processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Cable assembly (fiber optic). One or more segments of fiber optic cable with connectors on the end of each segment.

3.2 Cable bundle, fiber optic. Single fiber cables grouped together and secured by lacing tape. The cable bundle can be placed in convoluted tubing, used in various protected harness configurations or used as is in an open cable harness configuration.

3.3 Cable, captive strength member. A component in the cable that increases the cable's strength, protects the optical fibers from strain and, when stranded in opposing lays, assists to minimize micro bending. When terminating a connector/terminus onto the end of a fiber optic cable, the captive strength member is secured to the connector/terminus. The intent is for a force caused by a pull on the cable to be placed on the captive strength member and not on the fiber inside the connector/terminus.

3.4 Cable, fiber optic. A cable that contains optical fibers. The cable may be of a tight buffer or a loose tube design.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6102

3.5 Cabling, fiber optic. Fiber optic cabling is a term used to include single fiber cable, multiple fiber cable, fiber optic cable bundles and fiber optic cable harnesses. The (optical) fiber is the optical conduit or waveguide transmission media, whereas metallic conductor (wire) is used in an electrical cable. Cable structure is added to make the fibers easier to handle and maintain. The fiber is a thin piece of glass (with a diameter usually around 125 micrometers) that contains and transports the light signals.

3.6 Cable harness, fiber optic. A cable assembly that consists of fiber optic cabling with or without cables run to different breakouts (branches) and with fiber optic connectors at the end of each cable run or segment. The cabling may contain a protective cover (protected cable harness) or remain exposed (open cable harness). Types of protective coverings include convoluted tubing (preferred for a fiber optic application) and braid. The connector is usually a multiple termini connector plug/receptacle and configured with connector accessories such as a backshell for cable strain relief, a backshell for affixing the protective covering to the connector or an EMI retention nut. The type of protective covering used must not be one that stresses the cable.

3.7 Cable harness, multiple segment (fiber optic). Two or more single segment cable harnesses mated together at the fiber optic connectors.

3.8 Cable harness, single segment (fiber optic). Single segment harnesses consist of cabling with connectors on each end. Different configurations for this cable harness may be multiple termini connector cable harnesses (such as plug-to-plug or plug-to-receptacle configurations) and multiple termini plug/receptacle to single fiber connector harnesses.

3.9 Cable, loose tube. A fiber optic cable design is one configured with one or more optical fibers are fitted loosely within a tube, giving the optical fibers freedom to move. This mobility and isolation from the tube minimizes the effects of external forces on the performance of the link. The isolation allows cable expansion and contraction with temperature independent of the optical fibers.

3.10 Cable, simplex. A cable containing a single fiber and may be configured as either tight buffer or loose tube construction.

3.11 Cable, tight buffer. A fiber optic cable design is one configured with an additional protective coding (additional buffer layer) is applied directly over a coated (buffered) fiber. Buffer material helps preserve the fiber's inherent strength and provides increased mechanical protection. A tight buffered cable allows cable placement in tighter bends, more roughed handling (such as better crush and impact resistance).

4. Requirements. Fiber optic cable shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic cables used shall be restricted to those in [TABLE 6102 – I](#). These cables include those that are a part of a fiber optic cable harness, those to transition to end user equipment interfacing with the cable harness, and those on patch cords.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6102

TABLE 6102 – I. Cable, high performance commercial, standard performance QPL.

Item	Description 1/, 2/, 3/	Quantity	CAGE code	Part number
6102AA	Cable, high performance (-55 to 165 °C), single fiber (simplex), tight buffer, with 100/140/172 micron fiber		OFS	BC05082
6102AB	Cable, high performance (-55 to 165 °C), single fiber (simplex), tight buffer, with 62.5/125 micron fiber		OFS	C10028
6102AC	Cable, high performance (-55 to 165 °C), single fiber (simplex), tight buffer, with 50/125 micron fiber		OFS	C10027
6102AD	Cable, high performance (-55 to 165 °C), single fiber (simplex), tight buffer, with 9/125 micron fiber		OFS	C14447
6102AE	Cable, high performance (-55 to 165 °C), single fiber (simplex), tight buffer, with 5.8/125 micron fiber		OFS	C10026
6102BA	Cable, high performance (-65 to 200 °C), single fiber (simplex), loose tube, with 100/140/172 micron fiber		General Cable	OC-1260
6102BB	Cable, high performance (-65 to 200 °C), single fiber (simplex), loose tube, with 62.5/125/155 micron fiber		General Cable	OC-1698
6102CA	Cable, standard performance (-28 to 65 °C), single fiber (simplex), tight buffer, with 62.5/125 micron fiber, qualified to MIL-PRF-85045		See QPL-85045	M85045/16-01
6102CB	Cable, standard performance (-28 to 65 °C), single fiber (simplex), tight buffer, with 8.5-10/125 micron fiber, qualified to MIL-PRF-85045		See QPL-85045	M85045/16-02

1/ Tight buffer cable preferred over loose tube cable.

2/ Cable OD increased with Raychem Part No. VTW-3/16 to penetrate grommet seal for MIL-DTL-38999 connectors.

3/ Cable OD: General Cable = 2.11 ± .05 mm (.08 inch ± .002 inch), OFS = 1.8 ± .1 mm (.07 inch ± (.004 inch), M85045/16 = 2.0 ± .2 mm (.078 inch ± .008 inch).

6. Notes.

6.1 Intended use. On these platforms, the fiber optic cable assemblies intended to be inspected include (1) cable harnesses, (2) equipment (electronic module/package) such as a(n) ATR, LRC, LRM, LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6103

EPOXIES, ADHESIVES AND GELS

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part referred to as the epoxies and adhesives. Specifically, the type of epoxy used is a two part, heat cured epoxy used to secure a fiber optic terminus or a single ferrule connector onto the end of a fiber optic cable. Adhesives include those that are UV curable. Gels are those used as index matching materials. This requirement is intended for developmental, prototype, production, rework, and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://my Natec.navair.navy.mil>. NATEC has three difference processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Epoxy. Epoxy (polyepoxide) is a thermosetting polymer solid adhesive that is formed from reaction of an epoxide "resin" with polyamine "hardener". The epoxy is used for bonding optical fibers to metal and ceramic fiber optic connector and terminus ferrules.

3.2 Index-matching material. Transparent material, that is, light-transmitting material, with a refractive index such that when used in intimate contact with other transparent materials, radiant power loss is reduced at interfaces by reducing reflection, reducing transmission loss, avoiding scattering, and reducing dispersion. For example, a liquid or cement whose refractive index is nearly equal to that of the core of an optical fiber, used to reduce Fresnel reflections from the fiber end-face.

3.3 Ultraviolet. Pertaining to the region of the electromagnetic spectrum in which wavelengths are shorter than those of the visible spectrum, but longer than x-rays. The ultraviolet region extends from about 1 nm (nanometer), which is the beginning of the optical spectrum, to about 400 nm, that is, the beginning of the visible region, or 0.001 to 0.4 μ m (micron). Because the frequency of ultraviolet radiation is higher than that of the visible region, the rays, that is, the photons, can kill some living organisms, such as some germs and bacteria, and can have a damaging effect on human cells if exposure time and irradiance is sufficiently high. Because of the higher frequencies, attenuation rates in glass are higher for the shorter-than-visible ultraviolet wavelengths and, because of the lower frequencies, attenuation rates are lower for the infrared, hence the interest in the use of infrared in long-haul optical fiber communication systems.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6103

3.4 UV. Ultraviolet.

3.5 UV adhesive. This is a one part adhesive cured using UV light. UV adhesives can cure in seconds to minutes depending upon UV dose, UV wavelength and curing duration used. The UV adhesives are usually acrylic based.

4. Requirements. Fiber optic epoxies, index matching materials (gels) and UV adhesives shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling (NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, epoxies, index matching materials (gels) and UV adhesives used shall be restricted to those in TABLE 6103 - I through TABLE 6103 - III.

TABLE 6103 – I. Epoxy.

Item	Description <u>1/</u>	Ref No. <u>2/</u>	CAGE code	Part number
6103AA	Epoxy, two-part, high performance (-55 to 165 °C), temperature range 2	N/A	33246	EPO-TEK 353ND
6103AB	Epoxy, two-part, fiber, optic, heat cured, (-28 to 85 °C)	0032	N/A	N/A

1/ Use cure schedule specified in WP 010 02 of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#); Installation and Testing Practices, Aircraft Fiber Optic Cabling.

2/ For surface ships and submarines, use the epoxy type and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Reference number ("Ref No") before the footnote refers to MIL-A-24792 epoxy bi-pack in the Navy Shipboard Fiber Optic Recommended Tools List.

TABLE 6103 – II. Index matching material.

Item	Description <u>1/</u>	Ref No. <u>2/</u>	CAGE code	Part number
6103BA	Index matching gel, high performance (-55 to 165 °C)	N/A	98354	Nye Optical OC-431A-LVP
6103BB	Index matching gel, fiber optic, (-28 to 85 °C)	0037	N/A	N/A

1/ Apply for each specific mechanical splice as specified in applicable Work Package (WP) of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#); Installation and Testing Practices Aircraft Fiber Optic Cabling.

2/ For surface ships and submarines, use the index matching material type and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Reference number ("Ref No") before the footnote refers to MIL-A-24794 index matching material in the Navy Shipboard Fiber Optic Recommended Tools List.

TABLE 6103 – III. UV adhesive.

Item	Description <u>1/</u>	Ref No. <u>2/</u>	CAGE code	Part number
6103CA	UV adhesive	N/A	TBD	TBD
6103CB	UV adhesive, one part, fiber optic, (-28 to 85 °C)	0095	N/A	N/A

1/ Use cure schedule for each specific mechanical splice as specified in applicable Work Package (WP) of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#); Installation and Testing Practices Aircraft Fiber Optic Cabling.

2/ For surface ships and submarines, use the UV adhesive type and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Reference number ("Ref No") before the footnote refers to MIL-A-24793 UV adhesive with syringe and needle in the Navy Shipboard Fiber Optic Recommended Tools List.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic cable assemblies intended to be inspected include (1) cable harnesses, (2) equipment (electronic module/package) such as a(n) ATR, LRC, LRM, LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6104

CONVOLUTED TUBING

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part referred to as the convoluted tubing. Specifically, two materials are specified for convoluted tubing. Footnotes in the table provide guidance for the selection of the proper material for the intended application. This requirement is intended for developmental, prototype, production, rework, and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling.

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. (A copy of this document is available online at www.sae.org or by writing to SAE World Headquarters, 400 Commonwealth Drive, Warrendale, PA 15096-0001.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Convoluted tubing, fiber optic. A plastic hollow, elongated, cylindrical structure or tube extruded with rigid supports used in fiber optic applications as one option for the cable harness protective cover. This plastic tube is relatively flexible, constructed with helical convolutions for rigidity and fabricated from materials and using processes to meet the specified application environmental requirements.

4. Requirements. Convoluted tubing for fiber optic applications shall be standardized for commonality compliance across platforms. Commonality compliance is that in which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and, as a result, to those cited in this Standard Practice.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6104

5. Implementation. Unless otherwise specified by the applicable Platform Office, convoluted tubing for use in fiber optic applications shall be restricted to those in TABLE 6104 - I. These offerings of convoluted tubing include those that are a part of a fiber optic cable harness, and those to transition to end user equipment interfacing with the cable harness.

TABLE 6104 – I. Convoluted tubing, FEP and PEEK materials.

Item	Description 1/, 2/, 3/, 4/, 5/	Quantity	CAGE code	Part number
6104AA	Convoluted tubing, SAE AS81914/4-1201 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID .188	N/A		NSN 5975-01-343-1294

6104AF	Convoluted tubing, SAE AS81914/4-1206 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID .500	N/A		NSN 9330-01-035-8932
6104AG	Convoluted tubing, SAE AS81914/4-1207 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID .625	N/A		NSN 4720-01-495-0318
6104AH	Convoluted tubing, SAE AS81914/4-1208 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID .75	N/A		NSN 9330-01-035-8933
6104AI	Convoluted tubing, SAE AS81914/4-1209 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID .875	N/A		NSN 5975-01-229-6341
6104AJ	Convoluted tubing, SAE AS81914/4-1210 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID 1.00	N/A		NSN 5975-01-216-3401
6104AK	Convoluted tubing, SAE AS81914/4-1211 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID 1.125	N/A		
6104AL	Convoluted tubing, SAE AS81914/4-1212 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID 1.25, 5.49 m length	N/A		NSN 9330-01-348-9026
6104AM	Convoluted tubing, SAE AS81914/4-1213 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID 1.50	N/A		NSN 4720-01-495-0334
6104AN	Convoluted tubing, SAE AS81914/4-1214 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID 1.75	N/A	06324	120-100-2-2-56-B-F, specify length in feet
6104AO	Convoluted tubing, SAE AS81914/4-1215 plastic, extra flex ble, FEP, class 2 (thin wall thk) , max ID 2.00	N/A	06324	120-100-2-2-64-B-F, specify length in feet
6104CA	Convoluted tubing, PEEK, SAE AS81914/11	N/A	06324	120-108-XX Series
			5/	200153-20XX Series

1/ Installation shall be performed per [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#); Installation and Testing Practices Aircraft Fiber Optic Cabling.

2/ FEP Convoluted tubing. Plastic convoluted tubing made from FEP (fluorinated ethylene propylene) is the preferred material due to the materials flexibility, high thermal stability and cost. Thin wall tubing versus standard wall tubing is specified for aircraft applications. Since both have close convolutions and similar crush resistance, weight advantage favors use of thin wall tubing.

3/ PEEK Convoluted tubing. For applications in which convoluted tubing is to be routed through personnel spaces and safety is the primary factor, the low smoke, zero halogen PEEK (polyether-ether-ketone) is specified. This material is more rigid, and as a result, more likely to have tube collapse/kinking occur during routing in tight spaces. No requirement for low temperature flexibility is addressed for PEEK. PEEK convoluted tubing usually breaks at less than 1,000 cycles at room temperature when flexed at or close to the minimum bend diameter. PEEK is not an appropriate material for dynamic applications where flexing occurs close to the minimum bend diameter and never recommend where the material will be continually flexed. PEEK material can be used in high vibration locations since vibration amplitudes do not come close to the minimum bend diameter. In applications such as at access panels where the convoluted tubing can be flexed in a very tight radius over several hundred times, a section of FEP convoluted tubing is recommended over that of PEEK.

4/ Convoluted tubing with pre-drilled drainage holes are preferred. If supplied, recommend holes in tubing be staggered along the length and at least every 60 degrees around the circumference. Part numbers provided in the table are for convoluted tubing that do not include pre-drilled drainage holes.

5/ Potential other sources of supply include Icore Electro-Plastics, 180 N. Wolfe Road, Sunnyvale CA 94086.

REQUIREMENT 6104

6. Notes.

6.1 Intended use. On these platforms, the fiber optic cable assemblies intended to be inspected include (1) cable harnesses, (2) equipment (electronic module/package) such as a(n) ATR, LRC, LRM, LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6105

BACKSHELL, SOLID

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part referred to as the backshell. Specifically, the backshell is placed on the cable entry end of the multiple termini connector. The backshell is used for mechanical and environmental protection and to interface the protective cover or cable strain relief of the cable harness with the connector (see 3.1). A solid backshell is one with a one-piece, solid backshell body. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies (see 6.2).

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6105

3. Definitions.

3.1 Backshell, fiber optic. The shroud or protective structure placed on the cable entry end of the multiple termini connector that provides mechanical protection of the fiber optic cable at the exit (cable entry end) of the connector. For protective cable harnesses with single fiber cabling, the backshell is used to interface the protective covering or cable strain relief of the cable harness with the connector. The backshell is also used to provide a degree of environmental sealing, depending upon the specific design.

3.2 Backshell, solid, fiber optic. A solid backshell is one with a one-piece, solid shell or body.

3.3 Backshell, split, fiber optic. A split backshell is one with two or more pieces that fit together and form a shell over the cabling. The multiple pieces can be in the form of split shell halves or other type penetrations within the shell.

3.4 Cable harness, multiple segment (fiber optic). Two or more single segment cable harnesses mated together at the fiber optic connectors.

3.5 Cable harness, single segment (fiber optic). Single segment harnesses consist of cabling with connectors on each end. Different configurations for this cable harness may be multiple termini connector cable harnesses (such as plug-to-plug or plug-to-receptacle configurations) and multiple termini plug/receptacle to single segment connector harnesses.

3.6 Protective cable harness. A cable harness in which a structure or material is placed over the cabling component as opposed to having exposed cabling (open cable harness). Types of protective coverings include convoluted tubing (preferred for a fiber optic application) and braid (such as cable wrap).

4. Requirements. Fiber optic backshell shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic backshells used shall be restricted to those in [TABLE 6105 – I](#) and [TABLE 6105 – II](#). Note that part numbers in these tables must be varied for parameter changes such as for cable entry interface (banding adapter or no cable entry interface instead of that for convoluted tubing). These backshells includes those that are a part of a fiber optic cable harness.

w/CHANGE 1

REQUIREMENT 6105

TABLE 6105 – II. Backshell, solid, single fiber cables, MIL-DTL-38999 connector, convoluted tubing cable entry interface, environmental resisting. 1/ - Continued.

- 1/ Planned to place components and connector assembly in WP 011 of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#); Installation and Testing Practices Aircraft Fiber Optic Cabling.
- 2/ Change "T" in last digit of part number to "K" for cable entry interface with PEEK convoluted tubing instead of FEP convoluted tubing.
- 3/ Change "T" in last digit of part number to "A" for cable entry interface with banding adapter instead of for convoluted tubing. Cable entry diameter is same as that specified for convoluted tubing.
- 4/ Change "T" in last digit of part number to "N" for no cable entry interface.
- 5/ Change "NF" in 9th and 10th digits of part number to "XW" for backshell made from composite instead of aluminum.
- 6/ Change "NF" in 9th and 10th digits of part number to "Z1" for backshell made from stainless steel instead of aluminum.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic cable assemblies intended to be inspected include (1) cable harnesses, (2) equipment (electronic module/package) such as a(n) ATR, LRC, LRM, LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

6.2 Advantages of solid backshells. The advantages include (1) fewer areas for seals to leak, (2) more economical for initial cost, (3) lighter weight, (4) smaller footprint, and (5) no vendor initial expensive investment for die-cast parts molds.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6106

BACKSHELL, SPLIT

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part referred to as the backshell. Specifically, the backshell is placed on the cable entry end of the multiple termini connector. The backshell is used to provide mechanical and environmental protection and to interface the protective cover or cable strain relief of the cable harness with the connector (see 3.1). A split backshell is one with either split shell halves or other type penetrations. This requirement is intended for developmental, prototype, production, rework, and modification programs on military platform fiber optic cable assemblies (see 6.2 and 6.3).

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATION

[MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling.

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6106

3. Definitions.

3.1 Backshell, fiber optic. Protective structure placed on the cable entry end of the multiple termini connector. This protective structure provides mechanical protection of the fiber optic cable at the cable entry end of the connector. For protective cable harnesses with single fiber cabling, the backshell is used to interface the protective covering or cable strain relief of the cable harness with the connector. The backshell is also used to provide a degree of environmental sealing, depending upon the specific design.

3.2 Backshell, solid, fiber optic. A solid backshell is one with a one-piece, solid shell or body.

3.3 Backshell, split, fiber optic. A split backshell is one with two or more pieces that fit together and form a shell over the cabling. The multiple pieces can be in the form of split shell halves or other type penetrations within the shell.

3.4 Cable harness, multiple segment (fiber optic). Two or more single segment cable harnesses mated together at the fiber optic connectors.

3.5 Cable harness, single segment (fiber optic). Single segment fiber harnesses consist of cabling with connectors on each end. Different configurations for this cable harness may be multiple termini connector cable harnesses (such as plug-to-plug or plug-to-receptacle configurations) and multiple termini plug/receptacle to single fiber connector harnesses.

3.6 Protective cable harness. A cable harness in which a structure or material placed over the cabling component as opposed to having exposed cabling (open cable harness). Types of protective coverings include convoluted tubing (preferred for a fiber optic application) and braid (such as cable wrap).

4. Requirements. Fiber optic backshell shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic backshells used shall be restricted to those in [TABLE 6106 – I](#). Note that part numbers in the table must be varied for parameter changes such as for cable entry interface (banding adapter or no cable entry interface instead of that for convoluted tubing). These backshells includes those that are a part of a fiber optic cable harness.

6106AR	Backshell, 90 degree, aluminum with cad plating, shell size 23, for 36 cavity insert, tube size 31.75 mm (1.25 inch), tube = FEP		53669	1021662-E36FBTH

1/ Planned to place components and connector assembly in WP 011 of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#), Installation and Testing Practices, Aircraft Fiber Optic Cabling.

2/ Change "T" in 13th digit of part number to "K" for cable entry interface with PEEK convoluted tubing instead of FEP convoluted tubing.

3/ Change "T" in 13th digit of part number to "A" for cable entry interface with banding adapter instead of for convoluted tubing. Cable entry diameter is same as that specified for convoluted tubing.

4/ Change "T" in 13th digit of part number to "N" for no cable entry interface.

5/ Change "FB" in 11th and 12th digits of part number to "XW" for backshell made from composite instead of aluminum.

6/ Change "NF" in 9th and 12th digits of part number to "Z1" for backshell made from stainless steel instead of aluminum.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6106

6. Notes.

6.1 Intended use. On these platforms, the fiber optic cable assemblies intended to be inspected include (1) cable harnesses, (2) equipment (electronic module/package) such as a(n) ATR, LRC, LRM, LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

6.2 Advantages of split backshells. The advantages include (1) do not have to slide the backshell down the cable (an advantage where there is no room or no cable length to do so), (2) can inspect/re-enter without removing the backshell front and rear adapters, (3) easier to assemble, (4) easier access, (5) more economical for maintenance and repair.

6.3 Disadvantages. The disadvantages include (1) larger footprint which eliminates its use for some applications/locations, (2) more weight which eliminates its use for some applications.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6107

EMI RETENTION NUT

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part referred to as the EMI retention nut. Specifically, the EMI retention nut is placed on the cable entry end of the multiple termini connector. The EMI retention nut is used in lieu of a backshell to provide environmental protection from entry or penetration of electromagnetic radiation. A common application for an EMI retention nut is one used in conjunction with a connector receptacle at the panel of an equipment module (placed inside the equipment module). This requirement is intended for developmental, prototype, production, rework, and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6107

3. Definitions.

3.1 EMI retention nut, fiber optic. A component placed on the cable entry end of the multiple termini connector in lieu of a backshell to provide environmental protection from entry or penetration of electromagnetic radiation. A common application for an EMI retention nut is one used in conjunction with a connector receptacle at the panel of an equipment module.

3.2 End user equipment. This equipment is either the source or destination of an optical signal. This equipment can be a cabinet, case, panel, or device. The devices include WRA: Weapons replaceable assembly, LRM: Line replaceable module, and LRU: Line replaceable unit.

3.3 Equipment module. This device is either the source or destination of an optical signal and is packaged in the form of a removable module from a rack or cabinet. The devices include WRA: Weapons replaceable assembly, LRM: Line replaceable module, and LRU: Line replaceable unit.

4. Requirements. Fiber optic EMI retention nut shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, EMI retention nut used shall be restricted to those in TABLE 6107 – I and [TABLE 6107 – II](#). These EMI retention nuts include those that are a part of a fiber optic connection or interface port at the panel of an equipment module.

TABLE 6107 – I. EMI retention nut, MIL-PRF-64266 connector, cable entry interface accessory. 1/

Item	Description <u>2/</u> , <u>3/</u>	Quantity	CAGE code	Part number <u>4/-</u> <u>6/</u>
6107AA	EMI retention nut, straight, aluminum with cad plating, shell size 11, for 02 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 11022
6107AB	EMI retention nut, straight, aluminum with cad plating, shell size 11, for 04 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 11032
6107AC	EMI retention nut, straight, aluminum with cad plating, shell size 13, for 06 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 13032
6107AD	EMI retention nut, straight, aluminum with cad plating, shell size 15, for 08 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 15042
6107AE	EMI retention nut, straight, aluminum with cad plating, shell size 15, for 10 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 15052
6107AF	EMI retention nut, straight, aluminum with cad plating, shell size 23, for 36 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 23102

1/ Planned to place components and connector assembly in WP 011 of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#), Installation and Testing Practices, Aircraft Fiber Optic Cabling.

2/ Braid cable entry diameter sized for an 80 percent or greater fill.

3/ Tubing ID to equivalent Glenair tube size #: 3/16 = 01, 5/16 = 03, 3/8 = 04, 7/16 = 05, 1/2 = 06, 5/8 = 08, 3/4 = 10, 7/8 = 12, 1 = 14, 1.25 = 15.

4/ Change the last digit of PIN from "2" to a different number (in 25.4 mm (1 inch) increments) for a longer braid length.

5/ Change "S" in fifth digit of PIN from "S" to "B" for a 45 degree orientation (versus straight), to "A" for a 90 degree orientation.

6/ Change "NF" in 9th and 10th digits of PIN to "XW" for a composite body (instead of aluminum), to "Z1" for a stainless steel body.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6107

TABLE 6107 – II. EMI retention nut, MIL-DTL-38999 connector, cable entry interface accessory. 1/

Item	Description	Quantity	CAGE code	Part number <u>2/</u> - <u>6/</u>
6107CA	EMI retention nut, straight, aluminum with cad plating, shell size 11, for 02 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 11022
6107CB	EMI retention nut, straight, aluminum with cad plating, shell size 13, for 04 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 13032
6107CC	EMI retention nut, straight, aluminum with cad plating, shell size 15, for 05 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 15032
6107CD	EMI retention nut, straight, aluminum with cad plating, shell size 17, for 08 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 17042
6107CE	EMI retention nut, straight, aluminum with cad plating, shell size 19, for 11 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 19052
6107CF	EMI retention nut, straight, aluminum with cad plating, shell size 21, for 16 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 21082
6107CG	EMI retention nut, straight, aluminum with cad plating, shell size 23, for 21 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 23082
6107CH	EMI retention nut, straight, aluminum with cad plating, shell size 25, for 37 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 25122
6107CI	EMI retention nut, straight, aluminum with cad plating, shell size 25, for 29 cavity insert, 50.8 mm (2 inch) braid length		06324	319HS001NF 25102

1/ Planned to place components and connector assembly in WP 011 of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#).

Installation and Testing Practices, Aircraft Fiber Optic Cabling.

2/ Change the last digit of PIN from "2" to a different number (in 25.4 mm (1 inch) increments) for a longer braid length.

3/ Change "S" in fifth digit of PIN from "S" to "B" for a 45 degree orientation (versus straight), to "A" for a 90 degree orientation.

4/ Change "NF" in 9th and 10th digits of PIN to "XW" for a composite body (instead of aluminum), to "Z1" for a stainless steel body.

5/ Braid cable entry diameter sized for an 80 percent or greater fill.

6/ Tubing ID to equivalent Glenair Tube size #: 3/16 = 01, 5/16 = 03, 3/8 = 04, 7/16 = 05, 1/2 = 06, 5/8 = 08, 3/4 = 10, 7/8 = 12, 1 = 14, 1.25 = 15.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic cable assemblies intended to be inspected include (1) equipment (electronic module/package) such as a(n) ATR, LRC, LRM, LRU or WRA with internal fiber optics, (2) circuit card modules and assemblies with internal fiber optics, and (3) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6108

BINDING AND HOLDING COMPONENTS FOR CABLING ASSEMBLY

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part used in a cable harness or other type fiber optic cabling for binding, holding, or otherwise securing other cable harness components. Specific materials include banding straps, lacing tape, and heat shrinkable insulation sleeves. This requirement is intended for developmental, prototype, production, rework, and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

COMMERCIAL ITEM DESCRIPTIONS

- | | | |

REQUIREMENT 6108

2.4 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

SAE INTERNATIONAL

SAE-AMS-DTL-23053/5	-	Insulation Sleeving, Electrical, Heat Shrinkable, Polyolefin, Flexible, Crosslinked.
SAE AS 85049/128	-	Electrical Backshell, Shield Band, Category 7 (for AS85049/82 - /90, /93, /109- /117 Accessories.

(Copies of these documents are available on line at www.sae.org from SAE International, 400 Commonwealth Drive, Warrendale, PA 15096-0001, and Tel: 877-606-7323 [inside USA and Canada] or 724-776-4970 [outside USA], email at CustomerService@sae.org.)

2.5 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Banding strap. A stainless steel, adjustable, tie-down band used to secure cable wrap to the banding platform of the backshell rear adapter. The banding strap includes a self-clinching clamp to hold the band in place in the longitudinal (long) direction.

3.2 Cable wrap. One type of protective cover on a protective cable harness that consists of wrap around, braided sleeving and that provides protection of the fiber optic cable bundle against mechanical wear, abrasion, impacts, and chafing and fluid contact. The cable wrap is secured along the length with lacing tape to permit re-entry and at the backshell with a banding strap.

3.3 Cable bundle, fiber optic. Single fiber cables grouped together and secured by lacing tape. The cable bundle can be placed in convoluted tubing, used in various protected harness configurations, or used as is in an open cable harness configuration.

3.4 Cable, fiber optic. A cable that contains optical fibers. The cable may be of a tight buffer or a loose tube design.

3.5 Cabling, fiber optic. Fiber optic cabling is a term used to include single fiber cable, multiple fiber cable, fiber optic cable bundles, and fiber optic cable harnesses. The (optical) fiber is the optical conduit or waveguide transmission media, whereas metallic conductor (wire) is used in an electrical cable. Cable structure is added to make the fibers easier to handle and maintain. The fiber is a thin piece of glass (with a diameter usually around 125 micrometers) that contains and transports the light signals.

3.6 Cable harness, fiber optic. A cable assembly that consists of fiber optic cabling with or without cables run to different breakouts (branches) and with fiber optic connectors at the end of each cable run or segment. The cabling may contain a protective cover (protected cable harness) or remain exposed (open cable harness). Types of protective coverings include convoluted tubing (preferred for a fiber optic application) and braid. The connector is usually a multiple termini connector plug/receptacle and configured with connector accessories such as a backshell for cable strain relief, a backshell for affixing the protective covering to the connector, or an EMI retention nut. The type protective covering used must not be one that stresses the cable.

3.7 Lacing tape. Tie-string consisting of a continuous filament, glass yarn with a synthetic finish used to secure bundles of fiber optic cabling and as a secondary support for fiber optic cable harnesses. This yarn has high resistance to aging and low moisture absorption.

3.8 Cable harness, single segment, fiber optic. Single fiber harnesses consist of cabling with connectors on each end. Different configurations for this cable harness may be multiple termini connector cable harnesses (such as plug-to-plug or plug-to-receptacle configurations) and multiple termini plug/receptacle to single fiber connector harnesses.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6108

4. **Requirements.** Fiber optic binding and holding components shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling (NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4) and to those cited in this Standard Practice.

5. **Implementation.** Unless otherwise specified by the applicable Platform Office, fiber optic binding and holding components used shall be restricted to those in TABLE 6108 - I. These binding and holding components include those that are a part of a fiber optic cable harness and those to transition to end user equipment interfacing with the cable harness.

TABLE 6108 – I. Binding and holding components for cabling assembly. 1/

Item	Description	Ref No 3/	CAGE code	Part number

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Cable wrap. A type of cover on a protective cable harness that consists of wrap around, braided sleeving and that provides protection to the fiber optic cable bundle against mechanical wear, abrasion, impacts, chafing and fluid contact. The cable wrap is secured along the length with lacing tape to permit re-entry and at the backshell with a banding strap.

3.2 Cable bundle, fiber optic. Single fiber cables grouped together and secured by lacing tape. The cable bundle can be placed in convoluted tubing, used in various protected harness configurations, or used as is in an open cable harness configuration.

3.3 Cable, fiber optic. A cable that contains optical fibers. The cable may be of a tight buffer or a loose tube design.

3.4 Cabling, fiber optic. Fiber optic cabling is a term used to include single fiber cable, multiple fiber cable, fiber optic cable bundles, and fiber optic cable harnesses. The (optical) fiber is the optical conduit or waveguide transmission media, whereas metallic conductor (wire) is used in an electrical cable. Cable structure is added to make the fibers easier to handle and maintain. The fiber is a thin piece of glass (with a diameter usually around 125 micrometers) that contains and transports the light signals.

3.5 Cable harness, fiber optic. A cable assembly that consists of fiber optic cabling with or without cables run to different breakouts (branches) and with fiber optic connectors at the end of each cable run or segment. The cabling may contain a protective cover (protected cable harness) or remain exposed (open cable harness). Types of protective coverings include convoluted tubing (preferred for a fiber optic application) and braid. The connector is usually a multiple termini connector plug/receptacle and configured with connector accessories such as a backshell for cable strain relief, a backshell for affixing the protective covering to the connector, or an EMI retention nut. The type protective covering used must not be one that stresses the cable.

MIL-STD-1678-6A

3/ Ratings include: Temperature range -60°C to 200°C, halogen free, fluid resistant, smoke/flammability/toxicity rated.

6. Notes.

6.1 Intended use. The fiber optic cable wrap is intended to be included as part of (1) cable harnesses, and (2) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6110

PLASTIC DUST CAPS

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic part used in on a cable harness or other type fiber optic cabling with a multiple termini connector as one (less preferred) option to provide a protective cover over the termini on a fiber optic connector. This requirement is intended for developmental, prototype, production, rework, and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-DTL-28840](#) - Connectors, Electrical, Circular, Threaded, High Density, High Shock, Shipboard, Class D, General Specification for.
- [MIL-PRF-28876](#) - Connectors, Fiber Optic, Circular, Plug and Receptacle Style, Multiple Removable Termini, General Specification for.
- [MIL-DTL-38999](#) - Connectors, Electrical, Circular, Miniature, High Density, Quick Disconnect, (Bayonet Threaded and Breech Coupling), General Specification for.
- [MIL-DTL-38999/26](#) - Connectors, Electrical, Plug, Circular, Threaded, Straight Removable Crimp Contacts, Series III, Metric.
- [MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

- [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM1-1500-232-24-4](#) - Installation and Testing Practices Aircraft Fiber Optic Cabling.

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

SAE INTERNATIONAL

- [SAE AS 85049/138](#) - Connector Accessories, Electrical, Cap, Dust, Plastic, Category 9.

(Copies of these documents are available on line at www.sae.org from SAE International, 400 Commonwealth Drive, Warrendale, PA 15096-0001, and Tel: 877-606-7323 [inside USA and Canada] or 724-776-4970 [outside USA], email at CustomerService@sae.org.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6110

3. Definitions.

3.1 Cable bundle, fiber optic. Single fiber cables grouped together and secured by lacing tape. The cable bundle can be placed in convoluted tubing, used in various protected harness configurations or used as is in an open cable harness configuration.

3.2 Cable, fiber optic. A cable that contains optical fibers. The cable may be of a tight buffer or a loose tube design.

3.3 Cabling, fiber optic. Fiber optic cabling is a term used to include single fiber cable, multiple fiber cable, fiber optic cable bundles, and fiber optic cable harnesses. The (optical) fiber is the optical conduit or waveguide transmission media, whereas metallic conductor (wire) is used in an electrical cable. Cable structure is added to make the fibers easier to handle and maintain. The fiber is a thin piece of glass (with a diameter usually around 125 micrometers) that contains and transports the light signals.

3.4 Cable harness, fiber optic. A cable assembly that consists of fiber optic cabling with or without cables run to different breakouts (branches) and with fiber optic connectors at the end of each cable run or segment. The cabling may contain a protective cover (protected cable harness) or remain exposed (open cable harness). Types of protective coverings include convoluted tubing (preferred for a fiber optic application) and braid. The connector is usually a multiple termini connector plug/receptacle and configured with connector accessories such as a backshell for cable strain relief, a backshell for affixing the protective covering to the connector or an EMI retention nut. The type protective covering used must not be one that stresses the cable.

3.5 Cable harness, single segment (fiber optic). Single fiber harnesses consist of cabling with connectors on each end. Different configurations for this cable harness may be multiple termini connector cable harnesses (such as plug-to-plug or plug-to-receptacle configurations) and multiple termini plug/receptacle to single fiber connector harnesses.

3.6 Plastic dust cap. A plastic covering with sufficient elasticity to fit over the connector threads of a fiber optic connector receptacle or the coupling ring of a fiber optic connector plug with the intended purpose of keeping out external dust and dirt from migrating to the termini within the connector.

4. Requirements. Fiber optic plastic dust cap shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the parts to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, metal dust covers shall be provided in lieu of plastic dust caps. Where allowed for acquisition or maintenance, plastic dust caps used shall be restricted to those in TABLE 6110 – I and [TABLE 6110 – II](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6110

6110AP		Receptacle	AS85049/138-53A	None	40.64	1.600	1.6230	EC-26

1/ Use as a plastic dust cap only and not as a plug (see note 5/). Used as a plastic dust plug can result in damage to the connector more resilient members.

2/ Dimensions provided in inches. For connector plug, interface is "S dia max" in MIL-DTL 38999/26. For connector receptacle, interface is the thread (in MIL-DTL-38999 for Series III).

3/ Plastic dust cap dimension from SAE AS85049/138.

4/ Part number is for CAGE Code 99017. Part is to be used as a plastic dust cap whether part is specified for use by vendor as an "electrical cap (EC)" or a "SD electrical plug (EP)" (see note 6/). Either the plastic dust cap or the plastic dust plug configuration can be used as a cap (see note 5/).

5/ Plastic dust cap is placed outside the connector shell. Plastic dust plug is placed inside the connector shell.

6/ Designation EC or EP is used to order a regular (not conductive, not ESD protective) dust cap/plug. Designation SEC or SEP is used to order an ESD (ESD protective only) plastic dust cap/plug. The rationale to not use the "both conductive and ESD protective CEC/CEP plastic dust cap/plug" in a fiber optic application is addressed in note 7/.

7/ Designation SEC or SEP can be changed to CEC or CEP, respectively, to order both conductive and ESD protective versus the ESD only SEC/SEP plastic dust cap/plug. A CEC/CEP plastic dust cap/plug is not used for fiber optic applications since the carbon does precipitate out of the plastic compound and migrate to the end face of termini.

TABLE 6110 – II. Plastic dust cap sizes to MIL-PRF-64266 connectors. 1/

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6110

TABLE 6110 – II. Plastic dust cap sizes to MIL-PRF-64266 connectors – Continued.

- 1/ Connector shell front end is the same as MIL-PRF-28876 fiber optic multiple termini connector and MIL-DTL-28840 circular, multiple contact, electrical connector.
- 2/ Plastic dust cap dimension from SAE AS85049/138.
- 3/ Dimensions provided in inches. For connector plug, interface is "A dia max" for MIL-PRF-64266 and "S dia max" for MIL-DTL-38999/26. For connector receptacle, interface is the thread (the maximum major diameter of BB thread for MIL-DTL-38999 Series III and T thread for MIL-PRF-64266).
- 4/ Part number is for CAGE Code 99017. Part is to be used as a plastic dust cap whether part is specified for use by vendor as an "electrical cap (EC)" or a "SD electrical plug (EP)" (see note 6/). Either the plastic dust cap or the plastic dust plug configuration can be used as a cap (see note 5/).
- 5/ Plastic dust cap is placed outside the connector shell. Plastic dust plug is placed inside the connector shell.
- 6/ EC or EP is used to order a regular (not conductive, not ESD protective) dust cap/plug. Designation SEC or SEP is used to order an ESD (ESD protective only) plastic dust cap/plug. The rationale to not use the "both conductive and ESD protective CEC/CEP plastic dust cap/plug" in a fiber optic application is addressed in note 7/.
- 7/ Designation SEC or SEP can be changed to CEC or CEP, respectively, to order both conductive and ESD protective versus the ESD only SEC/SEP plastic dust cap/plug. A CEC/CEP plastic dust cap/plug is not used for fiber optic applications since the carbon does precipitate out of the plastic compound and migrate to the end face of termini.

6. Notes.

6.1 Intended use. The fiber optic plastic dust cap is intended to be included as part of (1) cable harnesses, and (2) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

SUPPORT EQUIPMENT STANDARDIZATION REQUIREMENTS FOR CABLE HARNESS CONFIGURATIONS

(6201 – 6209)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6201

FERRULE END FACE CONSUMABLE CLEANING SUPPLIES AND EQUIPMENT.

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) consisting of consumable cleaning supplies and equipment that are used to clean the ferrule end faces of fiber optic termini and single ferrule connectors. Included in these supplies and equipment are cleaning cloths, swabs and solvents. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, cleaning equipment (consumable cleaning supplies). The number one cause for an increased optical loss is dirt. No single cleaning method has been found to date that will guarantee a clean end face on the ferrule. Visual inspection together with manual cleaning equipment (consumable cleaning supplies) is important when practical. Recommended cleaning supplies are listed in this appendix. Visual inspection may be done using a Fiber Optic Video Inspection System or FOVIS (see Requirement 6202). Powered cleaning equipment for aircraft applications is under development (via the SBIR process) and will be addressed once available.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

FEDERAL SPECIFICATION

[TT-I-735](#) - Isopropyl Alcohol.

DEPARTMENT OF DEFENSE SPECIFICATION

[MIL-PRF-29504](#) - Termini, Fiber Optic Connector, Removable, General Specification for.

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM1-1500-232-24-4](#) - Installation and Testing Practices Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWCD Web Site in the Fiber Optics Recommended List section. This NSWCD Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWCD_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6201

2.4 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

NATIONAL AEROSPACE FOD PREVENTION, INC (NAFPI)

[FOD Prevention Guideline \(covering both Foreign Object Damage and Foreign Object Debris\)](#).

(Copies are available online at <http://www.nafpi.com> or from National Aerospace FOD Prevention, Inc., at 15731 Brayton Street, Paramount, CA 90723) or by phone at (800) 363-1211.

2.5 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Cleaning cloth. A lint-free pad used to wipe the ferrule end face. This pad can be used dry or moistened with a solvent (such as reagent grade isopropyl alcohol).

3.2 Swab. A stick containing a lint-free, particulate and fluid absorbing pad on one or both ends and used to clean the ferrule end faces of fiber optic connectors and termini.

4. Requirements. Fiber optic ferrule end face consumable cleaning supplies and equipment will be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the support equipment to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic ferrule end face consumable standard cleaning supplies and supplemental cleaning supplies used shall be restricted to those in [TABLE 6201-I](#) and [TABLE 6201-II](#), respectively. These fiber optic ferrule end face consumable cleaning supplies and equipment are used on connectors and termini that are a part of a fiber optic cable harness, those to transition to end user equipment interfacing with the cable harness, and those on patch cords.

			0NL21	CCTS-16-0902MZ (QTY:10)
6201AJ	Cleaning tool, push advance cloth ribbon cartridge, tip for use with 1.58 mm ferrule and for insertion thru a Glenair test probe adapter to a 1.58 mm ferrule (M29504/4 and /5 termini)	N/A	1WEB4	14829
6201AK	Cleaning tool, push advance cloth ribbon cartridge, tip for use with 1.25 mm ferrule and for insertion thru a MIL-PRF-64266 test terminus adapter to a 1.25 mm ferrule (M29504/18 & /20 termini)	N/A	1WEB4	14649
6201AL	Mechanical cleaner (click clean) for use with 2.0 mm M29504/14, /15 terminus in M28876 connector	0138	N/A	N/A

1/ Alternate sources of isopropyl alcohol (also known as IPA) must be of a high purity (> 99 percent, i.e., reagent grade or equivalent). TT-I-735 Grade A isopropyl alcohol may be used in lieu of item number 6102AC or 6102AG.

2/ Use 1.25 mm (.06 inch) cleaning swabs for MIL-PRF-29504 termini (1.58 (.06 inch) and 2.0 mm (.08 inch) ferrule diameters).

3/ NSN is 5120-01-553-6822 for this part number. Swab is dual tipped (cleaning tip on each end for wet then dry cleaning using one swab).

4/ NSN is 6070-01-553-2267 for this part number.

5/ NSN is 5120-01-535-6256 for this part number. Swab is dual tipped (cleaning tip on each end for wet then dry cleaning using one swab).

6/ NSN is 6070-01-553-2263 for this part number.

7/ Individual, pre-saturated, isopropyl alcohol packets can be obtained under NSN 6510-01-543-5190 versus a box of 50.

8/ A copy of the National Aerospace FOD Prevention, Inc. (NAFPI) FOD Prevention Guideline (covering both Foreign Object Damage and Foreign Object Debris) can be obtained by contacting 1-800-FOD-1211.

9/ FOD containers, including belt pouches, rectangular bags, and tool buckets are available commercially. One source of supply can be found at web site: www.estextmfg.com.

10/ This swab has an extra-long (extended) cleaning tip to allow tip penetration through a connector probe adapter to reach and clean the terminus end face. Cleaning swab specified for 1.58 (.06 inch) and 2.0 mm (.08 inch) diameter ferrules, so may not be able to use with 1.25 mm (.05 inch) diameter ferrule connectors.

11/ NSN is 6070-01-553-2262 for this part.

12/ For surface ships and submarines, use the cleaning supply types and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Reference number ("Ref No") before the footnote refers to a specific cleaning supply in the Navy Shipboard Fiber Optic Recommended Tools List.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6201

TABLE 6201 – II. Supplemental cleaning supplies.

Item number	Description	Ref No <u>1/</u>	CAGE code	Part number
6201CA	Connector cleaning tape cassette	<u>2/</u> , <u>3/</u>	0XY53	945
6201CB	Replacement cleaning tape	N/A	0XY53	945/1
6201CF	Canned air (canned liquefied gas) NSN: 6850-01-346-9144	0013	18598	MS222N

1/ For surface ships and submarines, use the cleaning supply types and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Reference number ("Ref No") before the footnote refers to specific cleaning supply in the Navy Shipboard Fiber Optic Recommended Tools List.

2/ Refer to Ref No 0115 for exposed ferrules (single ferrule connectors and termini not in connector).

3/ Refer to Ref No 0138 for 2.0 mm M29504/14, /15 terminus in M28876 connector.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic ferrule end face consumable cleaning supplies and equipment are intended to be used for cleaning connectors and termini that are a part of (1) cable harnesses, (2) equipment (electronic module/package) such as a(n) ATR, LRC, LRM, LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6202

FERRULE END FACE INSPECTION EQUIPMENT

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) consisting of video (camera) equipment that is used to inspect the ferrule end faces of fiber optic termini and single ferrule connectors. Included with this Fiber Optic Video Inspection System (FOVIS) are the probe tips needed to adapt to each different ferrule diameter and length. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, ferrule end face inspection using a Fiber Optic Video Inspection System (FOVIS). The FOVIS can view the optical fiber on the ferrule end face of a connector or terminus. Different adapters are provided to allow viewing for different ferrule diameters and for connectors behind various bulkhead adapters. This system consists of a probe (camera with probe tip), display (that also houses a rechargeable battery) and interconnecting cabling. The magnification for the FOVIS in this Test Kit allows for "General Inspection". The General Inspection mode allows for a larger field of view and smaller fiber image size (displaying a larger area of the ferrule) and is capable of viewing a fiber end-face that is either accessible or that is within an alignment sleeve (either inside a receptacle or a bulkhead adapter).

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATION

[MIL-PRF-28800](#) - Test equipment for use with electrical and electronic equipment, general specification for

DEPARTMENT OF DEFENSE STANDARD

[MIL-STD-461](#) - Requirements for the Control of Electromagnetic Interference Characteristics of Subsystems and Equipment

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6202

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling.

(A copy of this document is available online at: <https://my Natec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Test Equipment List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for tools) that may be applicable to the logistic support requirements for the specified test equipment. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Fiber Optic Video Inspection System (FOVIS). Support equipment used to inspect the ferrule end face of single ferrule connectors, fiber optic termini, connectors behind bulkhead adapters, and fiber optic interface ports. The FOVIS consists of a probe (camera with probe tip), display (that also houses a rechargeable battery) and interconnecting cabling. Single or dual magnification allows for general or for a closer fiber inspection.

3.2 Fiber inspection. A higher magnification (approximate equivalent to 400X on an optical microscope) is used to view the end face for fiber imperfections. A smaller area of the ferrule is displayed (smaller field of view) with the resulting larger fiber image size.

3.3 General inspection. A lower magnification (approximate equivalent to 200X on an optical microscope) is used to view the end face for cleanliness. A larger area of the ferrule is displayed (larger field of view) with the resulting smaller fiber image size.

4. Requirements. Fiber optic support equipment (SE) for the Fiber Optic Video Inspection System (FOVIS) shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the support equipment to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, Fiber Optic Video Inspection System (FOVIS) used shall be restricted to those in [TABLE 6202 – I](#) through [TABLE 6202 – IV](#).

REQUIREMENT 6202

TABLE 6202 – I. Fiber Optic Inspection System (FOIS) hardened aircraft support equipment – Continued.

- 1/ Other potentially needed probe tips are listed in TABLE 6202 – IV. Fiber Optic Video Inspection System (FOVIS) other potentially needed probe tips.
- 2/ Requirements for custom case listed under supplemental information below.
- 3/ Probe tips come in different configurations. In one of the configurations, the probe tip is inserted directly onto the ferrule of the connector or terminus. This configuration is sometimes referred to as a “patch cord probe tip” as one of the applications inspected is patch cords. One exception to this configuration probe tip is for a socket terminus. The probe tip is placed onto the surface of the connector insert cavity or socket terminus alignment sleeve. A second configuration is referred to as a “bulkhead adapter probe tip”. This second configuration probe tip is one that is placed into a connector adapter (such as an ST-to-ST adapter), a connector (test) probe adapter, or the equivalent interface port (such as the equipment LC connector interface port).
- 4/ This kit less the custom case can be obtained from CAGE Code 1QLU8 under part number FBP-NAV-H1.
- 5/ Militarized for high EMI environment in accordance with [MIL-STD-461](#) and other tailored environmental compliance with [MIL-PRF-28800](#).
- 6/ This probe tip can be used to inspect the M38999 connector test probe also (M38999 connector test probe is used with the M38999 connector test probe adapter).
- 7/ This probe tip is used without the standard barrel adapter on the video inspection probe.
- 8/ Probe tip comes with a cap or extension with affixed lanyard that is placed on the probe tip for viewing a pin terminus and taken off for viewing a socket terminus.
- 9/ Standard barrel adapter. This component contains lenses for the video inspection probe and is the barrel adapter used with the probe tips in this table (except those identified by note 7/).

TABLE 6202 – II. Fiber Optic Video Inspection System (FOVIS) field user kit.

Item number	Description 5/	Ref No 6/	CAGE code	Part number

6202DBProbe tip, for M29504/4 pin terminus 2/ NSN 6625-01-530-7055	N/A	1QLU8	FBPT-MIL-2P
6202DCProbe tip, for M29504/5 socket terminus NSN 6625-01-530-7053	N/A	1QLU8	FBPT-MIL-2S
6202DEProbe tip, for 1.25 mm (.05 inch) dia. Ferrule NSN 5999-01-540-7508	7/	1QLU8	FBPT-U12M
6202DFProbe tip, for 2.5 mm (.10 inch) dia. Ferrule NSN 5999-01-540-7516	7/	1QLU8	FBPT-U25M
6202DG	Probe tip, bulkhead adapter, view thru M38999 test probe adapter, 1.63 mm (.064 inch) bore 3/, 4/	N/A	1QLU8	FBPT-MIL-2CPA
6202DH	Probe tip, bulkhead adapter, view thru LC-to-LC adapter NSN 5999-01-559-0254	N/A	1QLU8	FBPT-LC

1/ Not militarized for high EMI environment per [MIL-STD-461](#) and other tailored environmental compliance with [MIL-PRF-28800](#).

2/ This probe tip can be used to inspect the M38999 connector (test) probe also (M38999 connector(test) probe is used with the M38999 connector(test) probe adapter).

3/ Probe tip comes with a cap or extension with affixed lanyard that is placed on the probe tip for viewing a pin terminus and taken off for viewing a socket terminus.

4/ This probe tip is used without the standard barrel adapter on the video inspection probe.

5/ Probe tips come in different configurations. In one of the configurations, the probe tip is inserted directly onto the ferrule of the connector or terminus. This configuration is sometimes referred to as a “patch cord probe tip” as one of the applications inspected is patch cords. One exception to this configuration probe tip is for a socket terminus. The probe tip is placed onto the surface of the connector insert cavity or socket terminus alignment sleeve. A second configuration probe tip is one that is placed into a connector adapter (such as an ST-to-ST adapter), a connector (test) probe adapter, or the equivalent interface port (such as the equipment LC connector interface port).

6/ For surface ships and submarines, use the fiber optic video inspection systems and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Test Equipment List, see 2.3. Reference number (“Ref No”) before the footnote refers to fiber optic video inspection systems (optical video microscopes) in the Navy Shipboard Fiber Optic Recommended Test Equipment List.

7/ Probe tip included as part of TS-0008.

6202LK	Probe tip, patch cord, M29504/18, /20 terminus, pin config, APC polish		1QLU8	FBPT-U12MX

^{1/} Probe tips come in different configurations. In one of the configurations, the probe tip is inserted directly onto the ferrule of the connector or terminus. This configuration is sometimes referred to as a "patch cord probe tip" as one of the applications inspected is patch cords. One exception to this configuration probe tip is for a socket terminus. The probe tip is placed onto the surface of the connector insert cavity or socket terminus alignment sleeve. A second configuration is referred to as a "bulkhead adapter probe tip". This second configuration probe tip is one that is placed into a connector adapter (such as an ST-to-ST adapter), a connector (test) probe adapter, or the equivalent interface port (such as the equipment LC connector interface port).

^{2/} Narrow barrel adapter. When used in conjunction with selected probe tips, the narrow versus standard barrel adapter must be mounted on the video inspection probe.

^{3/} Probe tip comes with a cap or extension with affixed lanyard that is placed on the probe tip for viewing a pin terminus and taken off for viewing through the ASR.

^{4/} This probe tip is used without the standard barrel adapter on the video inspection probe.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic Fiber Optic Video Inspection System (FOVIS) is intended to be used to inspect the connectors and termini ferrule end faces on (1) cable harnesses, (2) equipment (electronic module/package) such as a(n) ATR, LRC, LRM, LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6203

TEST AND TROUBLESHOOTING EQUIPMENT

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) for test and for troubleshooting fiber optic cable harnesses and other fiber optic cabling configurations. Included in this fiber optic test and troubleshooting equipment are optical sources, an optical power meter, visual fault finder, and retention clip seating tester. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, test and troubleshooting equipment. This requirement defines the test equipment and accessories needed to test a fiber optic cable topology with single mode (such as 5.8/125, 7.5/125 or 9/125 micron optical fiber) and with multimode (such as 50/125, 62.5/125 or 100/140 micron) optical fiber. The fiber optic components in this cable topology include the fiber optic cable, connectors (both single ferrule and multiple termini types). Equipment covered in this requirement is for the optical loss test and for a visually observed, fault illumination test. Low loss jumpers, referred to as MQJ or Measurement Quality Jumpers herein, and other supplemental items required for the optical loss measurement, such as any interconnecting adapters, are addressed in [Requirement 6205](#) and [Requirement 6207](#). Optical loss measurements are performed on the various configurations of fiber optic cable topology to verify optical performance of the installed cable. The various fiber optic cable topologies include fiber optical links (general term for cable assemblies), harnesses (usually multiple termini connector plug-to-plug cable assemblies) and pigtail assemblies (multiple termini receptacle-to-single fiber cables ending with single terminus connectors).

1.1.1 Test equipment, optical source and power meter. The optical source is used to launch optical power (light) into an optical link. The power meter (optical detector) is used to measure the amount of optical power coupled out of the optical link. This listing has both ST connector and FC connector interface adapters for the optical source and the power meter. The optical source for multimode fiber sizes has an LED (Light Emitting Diode) that emits light at the 850 nm and 1300 nm wavelengths. The optical source for single mode fiber sizes has an LD (Laser Diode) that emits light at the 1310 nm and 1550 nm wavelengths.

1.1.2 Test equipment, optical source wavelength. For aircraft designated components, the following optical source wavelength guidance is provided where Platform specific information is not provided. Test fiber optic components using an optical source at the wavelength of operation. If the operating wavelength is unknown, then test single mode, fiber optic components using optical sources at both the 1310 nm and the 1550 nm wavelengths. Multimode fiber optic components can be tested using an optical source at either the 850 nm or the 1300 nm wavelength. Current preference is to use the 850 nm wavelength. For single mode, a different loss mechanism dominates each window. Connection losses are greater at the 1310 nm wavelength. Microbend sensitivity losses dominate the 1550 nm wavelength. For multimode, difference in loss at the 850 nm and 1300 nm wavelength are cable length dependent. This loss is greater at the 850 nm wavelength.

1.1.3 Troubleshooting equipment, visual fault finder. The visual fault finder is a 630 nm (visible light) wavelength LD (laser diode) light source (Class 2 with a maximum power level of 1 mW). Visible light is seen at breaks near the ferrule and inside some type cable jackets. The visual fault finder is packaged in a flashlight configuration and contains two to three AAA or AA batteries for 40 to 80 hours of continuous use.

1.1.4 Troubleshooting equipment, retention clip seating tester. A retention clip seating tester is used to verify that a fiber optic terminus is seated within the retention clip (contact retainer clip) of a multiple termini connector (such as the MIL-DTL-38999 Series III and MIL-PRF-64266 connectors). If a "click" is heard, then it is assumed that the terminus is "locked" into place. This may not be the case. For instance, each cavity in a MIL-DTL-38999 connector insert has a retention clip. Each retention clip has at least two fingers. If a fiber optic terminus is not inserted completely, the fingers may not lock onto the terminus shoulder (i.e., the smaller diameter below the shoulder). The fingers of the retention clip remains sitting on top of the shoulder (i.e. the larger diameter of the terminus shoulder). When mated, the action of the two termini contacting can push back on the unlocked terminus.

1.1.5 Ferrule length gauge. A ferrule length gauge is used to verify that a sufficient protrusion length remains within the fiber optic terminus once the ferrule end face is refurbished.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6203

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATION

[MIL-PRF-28800](#) - Test equipment for use with electrical and electronic equipment, general specification for

DEPARTMENT OF DEFENSE STANDARD

[MIL-STD-461](#) - Requirements for the Control of Electromagnetic Interference Characteristics of Subsystems and Equipment.

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM1-1500-232-24-4](#) - Installation and Testing Practices Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Test Equipment List

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for tools) that may be applicable to the logistic support requirements for the specified test equipment. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Optical source (fiber optic light source). A device that emits radiation in or near the visible region of the electromagnetic spectrum, for example, light-emitting diodes (LED), laser diodes (LD), and lamps (broad spectrum), for providing optical power to optical measurement system/instrumentation.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6203

3.2 **Power meter (fiber optic detector or photo-detector).** An optoelectronic device that accepts optical signals from an optical source through the propagation medium (including fiber optic cabling and the DUT or Device Under Test), detects them by converting them into electronic signals (through a light-sensitive element, such as a photodiode), amplifies, and further processes the electrical signal into units of measure of optical power in Watts (i.e., nano-Watts or micro-Watts) or power ratio in dB or dBm.

4. **Requirements.** Fiber optic support equipment (SE) for fiber optic cabling test and troubleshooting shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the support equipment to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. **Implementation.** Unless otherwise specified by the applicable Platform Office, Fiber optic support equipment (SE) for fiber optic cabling test and troubleshooting used shall be restricted to those in [TABLE 6203 – I](#) through [TABLE 6203 – V](#). [TABLE 6203 – VI](#) specifies the ferrule length gauge for field use. [TABLE 6203 – VII](#) specifies the optical loss test equipment for a shipboard applications. The support equipment (SE) for fiber optic cabling test and troubleshooting is used at the connection ends (connectors and termini) of the cabling that are a part of a fiber optic cable harness, those to transition to end user equipment interfacing with the cable harness, and those on patch cords.

TABLE 6203 – I. Optical loss test equipment. 1/, 2/, 3/, 4/.

Item	Description	Quantity	CAGE code	Part number
OPTICAL SOURCE SELECTIONS, MULTIMODE				
6203AA	Optical source (LED, 850 nm and 1,300 nm, full fill) <u>1/</u> , <u>4/</u> Formerly model number 252A-AS100-EMI.	1	0XY53	570XL-AS100-EMI
6203AB	Optical source (LED, 850 nm, full fill) <u>2/</u> Formerly model number 257A-AS100.	1	0XY53	577XL-AS100
OPTICAL SOURCE SELECTIONS, SINGLE MODE				
6203BA	Optical source (LD, 1,310 and 1550 nm) <u>1/</u> Formerly model number 266A-EMI.	1	0XY53	580XL-EMI
6203BB	Optical source (LD, 1,310 nm and 1,550 nm) <u>2/</u> Formerly model number 262A.	1	0XY53	580XL-xx <u>3/</u>
ADAPTER SELECTION FOR OPTICAL SOURCES				
6203CA	FC adapter (narrow key, phosphor bronze alignment sleeve)	1	0XY53	APC-109
6203CB	ST adapter	1	0XY53	ATS-108
6203CC	Adapter, MIL-PRF-29504/4 and MIL-PRF-29504/5	1	0XY53	AML-38
OPTICAL POWER METER SELECTIONS				
6203DA	Optical power meter (+3 to -60 dBm, 1 mm (0.04 inch) In GaAs) <u>1/</u> Formerly model number 555B-EMI.	1	0XY53	560XL-EMI
6203DB	Optical power meter (+3 to -60 dBm, 1 mm (0.04 inch) In GaAs) <u>2/</u> Formerly model number 555B.	1	0XY53	560XL
ADAPTER SELECTIONS FOR OPTICAL POWER METER				
6203EA	FC adapter, Snap-On Connector interface (SOC)	1	0XY53	T1020
6203EB	ST adapter, SOC	1	0XY53	T1030
6203EC	Test probe adapter, M38999, SOC	1	0XY53	T1038

1/ Militarized for high EMI environment in accordance with [MIL-STD-461](#) and other environmental compliance with [MIL-PRF-28800](#).

2/ Commercial variant of product

3/ Used fixed interfaces (either FC, SC or ST) and are not replaceable (where -xx in part number is FC, SC or ST).

4/ Product for non-EMI optical source (LED, 850 and 1300 nm, full fill), Model 252A-AS100 is no longer available.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6203

TABLE 6203 – II. Visual fault finder (locator) test equipment.

Item	Description	Ref No. 4/, 5/	CAGE code	Part number 1/
6203FA	Visual Fault Locator (VFL) with 2.5 mm (.10 inch) ferrule adapter 1/	TS-0011 6/ 0096 7/	1QLU8	FFL-050
6203FB	Adapter tip, 2.5 mm-to-1 25 mm (.10 inch to .05 inch), for FFL-050	N/A	1QLU8	FFL-050-U12
6203FC	Adapter cable, 2.5 mm-to-1.58 mm (.10 inch to .06 inch), for FFL-050	N/A	2/	3/

1/ Ensure that any alternate selection is one with a Class 2 laser classification and a power level rated at 1 mW (versus one with a Class 3A and a 5 mW power level).

2/ Suggested sources in accordance with NSWC DD certified MQJ vendors are CAGE Codes 3ET44, 08RC6, 53669, 088U0.

3/ This requirement can be satisfied by a jumper (single fiber cable patch cord), 1.25 mm-to-2.5 mm (.05 inch to .10 inch) ferrule diameter (such as LC-to-ST), approximate 30.48 cm (1 foot) length, 62.5/125 micron fiber. The single fiber cable shall consist of a buffered fiber surrounded with a concentric layer of yarn strength members and polymer jacket. Single fiber cable shall be of sufficiently robust construction to permit frequent handling and have a minimum diameter of 2 mm (.08 inch) nominal.

4/ For surface ships and submarines, use the optical leak detector and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Test Equipment List, see 2.3. Reference number ("Ref No") before the footnote refers to optical leak detector in the Navy Shipboard Fiber Optic Recommended Test Equipment List.

5/ For surface ships and submarines, use the visual fault finder and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Each reference number ("Ref No") refers to a specific visual fault finder in the Navy Shipboard Fiber Optic Recommended Tools List.

6/ Ref No. TS-0011 optical leak detector is a light source and a light detector

7/ Ref No. 0096 visual fault locator is a red light source only. An Observer is required to visually detect the light.

TABLE 6203 – III. Retention clip seating tester.

Item	Description	Ref No. 1/	CAGE code	Part number
6203GA	Retention clip seating tester, fiber optic termini, M29504/4, M29504/5, M29504/14, M29504/15, M29504/18 in accordance with Requirement 6301	0126	11851	HT260-2N
			1EG24	K-504FO Kit

1/ For surface ships and submarines, use the terminus retention clip seating tester and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Reference number ("Ref No") before the footnote refers to that number in the Navy Shipboard Fiber Optic Recommended Tools List.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6203

TABLE 6203 – IV. Supplemental test equipment 1/, 2/

Item	Description	Ref No <u>3/</u>	CAGE code	Part number
6203HA	Return loss meter and test set (LD, 1310 nm and 1550 nm), one unit, ST and FC adapters, mandrel, 10 dB to 45 dB ORL measurement range NSN 6650-01-508-2437	TS-0004	0XY53	525N-60
	(alternate selection) Return loss meter and test set (LD, 1310 nm and 1,550 nm), one unit, APC-SC interface, APC jumper, mandrel, 0 to 65 dB ORL measurement range	TS-0006	0NL21	ORL3-3 ASC
6203HB	OTDR, Avionics, 100/140 micron MM fiber size, high resolution, cm wavelength, field verification of cal <u>1/</u>	N/A	OXY53	OFM-1020-85MM100-CAL
6203HC (with first option of modules)	OTDR, general use, 3 meter (9.84 foot) resolution, OTDR mainframe w/ multimode 850 nm and 1300 nm modules only <u>2/</u> NSN 6625-01-560-2285	TS-0003	61141	TB6000-NV-P1
6203HD (with second option of modules)	OTDR, general use, 3 meter (9.84 foot) resolution, OTDR mainframe w/ single mode 1310 nm module only <u>2/</u> NSN 6625-01-560-2320	TS-0003	61141	TB6000-NV-P2
6203HE (with third option of modules)	OTDR, general use, 3 meter (9.84 foot) resolution, OTDR mainframe w/ both multimode modules and single mode module <u>2/</u> NSN 6625-01-560-2325	TS-0003	61141	TB6000-NV-P3

1/ Currently recommended OTDR until more portable cm resolution OTDR is available.2/ OTDR use is used for inspection of cable reels. For troubleshooting (finding location of breaks) in cable harness segments (short cable lengths in meters), use 6203HB. Module is under development with cm resolution for this OTDR mainframe.3/ For surface ships and submarines, use the return loss meters, OTDR's and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Test Equipment List, see 2.3. Reference number ("Ref No") before the footnote refers to test equipment in the Navy Shipboard Fiber Optic Recommended Test Equipment List.

REQUIREMENT 6203

TABLE 6203-VII. OPTICAL LOSS TEST SETS (OLTS), NAVY SHIPBOARD.

Item	Description	Quantity	Ref No. <u>6/</u>
6203LA	Optical Loss Test Set (OLTS), Single Mode, PC polished interface ports <u>1/</u> , <u>2/</u>	<u>5/</u>	TS-0004
6203LB	Optical Loss Test Set (OLTS), Multimode <u>3/</u> , <u>4/</u> , <u>6/</u>	<u>5/</u>	TS-0005
6203LC	Optical Loss Test Set (OLTS), Single Mode, APC polished interface ports <u>1/</u>	<u>5/</u>	TBD

1/ Replaces CAGE Code 0XY53, Model 525N-60-PCX OLTS under former SCAT 4954/SCAT 4952, NRL 5524 of 13 March 2002.

2/ A single mode OLTS is used to measure optical loss and return loss.

3/ Replaces CAGE Code 0XY53, Model 525N-30-PCX OLTS under former SCAT 4954/SCAT 4952, NRL 5524 of 13 March 2002.

4/ A multimode OLTS is used to measure optical loss.

5/ Quantity depends on ship class, refer to SPETERL (Ship Portable Electrical/Electronic Test Equipment Requirement List) for quantities.

6/ For surface ships and submarines, use the optical loss test sets and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Test Equipment List, see 2.3. Reference number ("Ref No") before the footnote refers to optical loss test sets (TS-0005 for multimode, TS-0004 for single mode) in the Navy Shipboard Fiber Optic Recommended Test Equipment List.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic test and troubleshooting equipment are intended to be used on (1) cable harnesses, (2) fiber optic test jumpers, and (3) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6204

TERMINATION EQUIPMENT

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) used to place the fiber optic single ferrule connector or terminus onto the end of a fiber optic cable. Included is equipment for cutting and strapping, injecting and crimping, curing, polishing, and connector assembly. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, termination. This requirement defines the tools and accessories that comprise the set (kit) for terminating (securing) a fiber optic connector, both single ferrule and multiple terminus type, on the end of a fiber optic cable. When the termination equipment (including polishing pucks, polishing paper, etc.) are used properly in accordance with the specified connector/terminus termination procedure, connector/terminus end face polishes with optical loss and return loss (single mode only) values, as specified in the component specifications, will be obtained. Also, this equipment is to be used with cleaning and inspection (using a Fiber Optic Video Inspection System, FOVIS) in [Requirement 6201](#) and [Requirement 6202](#) for ferrule end face inspection and cleaning where some of the termination equipment (such as polishing puck and polishing paper) are used (required) as part of the cleaning operation. The recommended connector/terminus termination equipment supports the following tasks:

- a. Cut and strip fiber optic cable, aramid yarn and optic fiber buffer/coating. This operation requires the use of cable and aramid yarn cutting and buffer stripping tools.
- b. Crimp aramid yarn (such as Kevlar) of fiber optic cable onto the connector. This operation requires the use of crimp tools and dies.
- c. Cure epoxy to secure the optic fiber to the ferrule at a specified cure cycle. This operation requires the use of specified curing oven and connector/terminus holding fixtures.
- d. Polish the ferrule end face to obtain the required optical loss and return loss. This operation requires the use of polishing pads, pucks and plates.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

TIA-604-10	-	FOCIS-10B Fiber Optic Connector Intermateability Standard, Type LC.

(Copies are available online at www.tiaonline.org or from Telecommunications Industry Association (TIA), 2500 Wilson Boulevard, Suite 300, Arlington VA 22201.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Termination. The act used to secure a fiber optic terminus or connector onto the end of a fiber optic cable.

4. Requirements. Fiber optic termination equipment shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the support equipment to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic termination equipment used shall be restricted to those in [TABLE 6204 – I](#) through [TABLE 6204 – IV](#). This fiber optic termination equipment is used for securing connectors and termini onto the cabling ends that are a part of a fiber optic cable harness, those to transition to end user equipment interfacing with the cable harness, and those on patch cords.

TABLE 6204 – I. Connector termination equipment – Continued.

Item	Description	Ref No 2/	CAGE code	Part number
INJECTING and CRIMPING				
6204CA	Crimp tool (frame), single ferrule connectors NSN 5120-01-419-3735	0021	30119	28-500
			OMP99	2100
6204CB	Crimp tool and die set, SC connector, non pull proof NSN 5120-01-419-4363	0019	30119	28-401
6204CC	Crimp tool and die set, SC and FC connectors	0019	08RC6	0700-1875
6204CD	Crimp tool and die set, LC connector	0016	08RC6	0700-1885
6204CG	Crimp tool and die set, ST connector (alt to both 6204CA and 6204CB)	0018	08RC6	0700-1855
6204CH	Crimp tool with die set having .0945 hex for MIL-PRF-29504/14, MIL-PRF-29504/15 and MIL-PRF-29504/18.	0017	53669	1143130-9S
			06324	182-071
6204CI	Die set, SC connector, pull proof (need crimp tool frame from 6204CC)	0120	08RC6	0700-1861
6204CJ	Polishing tool (puck), APC polish, M29504/20 terminus		08RC6	0700-1732
			06324	182-021K
			OYPM2	FSTF10354-3
CLEAVING (SCORING)				
6204CR	Scribe, fiber optic, carbide NSN 5110-01-419-4360	0014	OYPM2	FSTP0010
			08RC6	0700-3750
6204CS	Debris bottle, flip-top, for cleaved fiber ends		08RC6	0700-9975
CURING				
6204DA	Curing oven, multiple step cure, programmable, epoxy curing, with heater block (24 terminus ports and 12 larger 2.5 mm port on one side), cable stand post, cable stand ring and cable clamps	N/A	08RC6	0721-1305
6204DB	Cure adapter, TIA-604-2 (ST), quantity: 12	N/A		
			08RC6	0700-1450
6204DC	Cure adapter, TIA-604-3 (SC), quantity: 12	N/A		
			08RC6	0700-1455
6204DD	Cure adapter, TIA-604-4 (FC), quantity: 12	N/A		
			08RC6	0700-1455
6204DE	Cure adapter, TIA-604-10 (LC), quantity: 24	N/A	08RC6	0700-1456
6204DF	Cure adapter, pin terminus, M29504/4 (M38999), quantity: 24	N/A	08RC6	0721-1125
6204DH	Cure adapter, pin terminus, M29504/18, /20 (M64266), quantity: 24	N/A	06324	0700-1456
6204DI	Micro clip, quantity: 24	N/A	76545	BU-34
6204DL	Needle nose pliers 1/	0028	08RC6	0745-2260
6204DM	Curing oven, single step cure, without heater block, cable stand post, cable stand ring and cable clamps, NSN 4430-01-419-6384	0028	08RC6	0701-4010
6204DN	Heater block, 16 port for terminus or on reverse side 12 port for single ferrule connectors (LC, ST, SC, FC), NSN 6070P N420-7682	0028	08RC6	0701-4020
6204DO	Cable stand post for curing oven (both 6204DA and 6204DM), NSN 6070-01-430-4607	0028	08RC6	0701-4030
6204DP	Cable stand ring for curing oven (both 6204DA and 6204DM), NSN 5365-01-420-3692	0028	08RC6	0701-4040
6204DQ	Cable clamps (both 6204DA and 6204DM), NSN 5340-01-422-2168	0028	08RC6	0701-4060
POLISHING				
6204FA	Polishing tool (puck), ST, SC and FC	0063	08RC6	0700-1750
6204FB	Polishing tool (puck), M29504/4 pin, styles 1, 2, and 3 (M38999), w/o grooves	N/A	06324	182-001P
6204FC	Polishing tool (puck), M29504/5 socket, styles 1, 2, and 3 (M38999), w/o grooves	N/A	06324	182-001S
6204FD	Polishing tool (puck), LC connector	0121	08RC6	0700-1725
6204FE	Polishing tool (puck), ceramic ferrule, M29504/4 pin and M29504/5 socket, style 1, 2, 3 (Alt to both 6204FB and 6204FC)	N/A	08RC6	0721-1530
6204FF	Polishing plate (glass, 152.4 mm x 152.4 mm (6 inch x 6 inch) min NSN 6080-01-377-4502	0062	08RC6	0700-4110
6204FG	Resilient pad, 70 to 90 durometer (alternatives, see 6204SA to 6204SC)	0067	76381	78-8073-7525-4
			41946	960-00071
			08RC6	0700-2045
6204FH	Water bottle, 4 ounce Squeeze, w/ cap NSN 8125-01-428-8839	0097	08RC6	0700-9700

See footnote at end of table.

MIL-STD-1678-6A

REQUIREMENT 6204

TABLE 6204 – I. Connector termination equipment – Continued.

Item	Description	Ref No. 2/	CAGE code	Part number
POLISHING-- Continued.				
6204FI	Polishing tool (puck), 1.25 mm (.05 inch) ferrule, generic (use for M29504/18, /20, alternative to 6204CD for LC connector)		0YPM2	FSPP-113-00-003
			06324	182-022
			0CKD9	F16930UN
6204FJ	Polishing tool (puck), APC polish, M29504/20 terminus		08RC6	0100-1732
			06324	182-022A
			0YPM2	FSTF10354-3
CONNECTOR ASSEMBLY				
6204GA	Boot ring tool, ST connector, FSI	0051	08RC6	0701-3070
6204GB	Screwdriver, reversible		08RC6	4300-9000
6204GC	Alignment (guide) sleeve removal tool, only for metal ferrule with jewel insert termini	N/A	71468	140146-0001A
6204GD	Alignment (guide) sleeve insertion (installation) tool, only for metal ferrule with jewel insert termini	N/A	71468	140146-0000A
6206CE	Insertion tool, metal, for M29504/4 and M29504/5	N/A	81349	M81969/8-07
6206CF	Insertion and extraction tool, plastic, for M29504/4 and M29504/5	N/A	81349	M81969/14-03
6206CG	Removal tool, metal, for M29504/4 and M29504/5	N/A	81349	M81969/8-08
MISCELLANEOUS				
6204HA	Flashlight	0034	62576	230
			7J761	1900C
6201AH	Foreign Object Debris (FOD) pouch, quantity: 6		08RC6	0400-3020
6204HC	Tweezers	0094	08RC6	0700-8911
6204HD	Eye loop, 7X min for viewing end face after each polish step NSN 6650-01-232-9536	0033	06175	654 2039
			4M564	ELP-174 10X
SAFETY				
6204IA	Safety glasses NSN 6540-01-433-7953	0071	75347	60050
			7J61	TK110
			08RC6	0700-8810
6204IB	Tweezers, Teflon coated NSN 6635-01-232-9536		32218	GTP-293
			7J761	6005268
			08RC6	0700-3196
6204IC	Mat, black, non-reflective work surface, 304.8 mm x 457.2 mm (12 inchesx18 inches) min.		71827	FS100
			08RC6	0700-9985

1/ Usage for needle nose pliers. Polishing: Removal of cure adapters if stick in oven due to epoxy leakage onto oven heating well bottom. Connector assembly: Removal of alignment sleeves from terminus pins.

2/ For surface ships and submarines, use the termination equipment and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Each reference number ("Ref No") refers to a specific item of termination equipment in the Navy Shipboard Fiber Optic Recommended Tools List.

TABLE 6204 – II. Connector termination supplies.

Item	Description	Ref No. 2/	Cage Code	Part number
CUTTING and STRIPPING				
6204JA	Masking tape, 19.05 mm x 36.78 m (3/4 inch x 40 yards) minimum NSN 7500—01-539-0552		08RC6	3300-6010
INJECTING and CRIMPING				
6204KA	Epoxy, heat cured, 2 part, 353ND, 2 gram A-PAKS, Temperature Range 2		64201	353ND-2g (QTY: 100 min)
			08RC6	3700-5520 (QTY: 6)
6204KB	Syringe barrel (reservoir), 3 ml, for epoxy injection into connector/terminus, quantity: 50 per box	0082	0XUL4	7012072
6204KC	Syringe plunger with piston (piston = flexible plastic bottom cap), for epoxy injection into connector/terminus, quantity: 50 per box	0082	0XUL4	7014779

See footnote at end of table.

REQUIREMENT 6204

TABLE 6204 – II. Connector termination supplies – Continued.

Item	Description	Ref No <u>2/</u>	CAGE code	Part number
6204KD	Dispensing (syringe) tip (needle), twist on, 20 gauge, 25.4 mm (1 inch) long, blunt end, for epoxy injection into all connector types except pull proof SC and LC connectors, quantity: 50 per box		0XUL4	7018166
		0031	08RC6	0700-5111
6204KE	Dispensing (syringe) tip (needle), twist on, 18 gauge, 12.7 mm (.5 inch) long, blunt end, for epoxy injection into pull proof SC and LC connectors only, quantity: 50 per box		0XUL4	701-8122
6204KF	Syringe (barrel, plunger and piston) w/twist on 20 gauge dispensing tips (needles), 3 ml capacity for dispensing epoxy NSN 5120-01-539-0526 Alternative to ordering 6204KB, 6204KC and 6204KD since packaged as a set. , quantity: 24 per pack	0082	08RC6	0700-5100
6204KG	Syringe (barrel, plunger and piston) w/twist on 18 gauge dispensing tips (needles), 3 ml capacity for dispensing epoxy Alternative to ordering 6204KB, 6204KC and 6204KE since packaged as a set. , quantity: 24 per pack		08RC6	0700-5110
6204KH	Epoxy, fast cured, Double Bubble Red, 2 part, 3.5 gram, 100/box for NSN NSN 8040-00-092-2816	N/A	96900	04001 (QTY: 1 box)
		N/A	08RC6	0700-5510 (QTY: 6)
6204KI	Dental floss, un-waxed, 45.72 m (50 yards) minimum NSN 6520-00-092-3181		32132	9215
6204KJ	Epoxy, temperature range 1, heat cured, 2 part, bi-pack, MIL-A-24792, NSN 8040-01-421-3510	0032	96900	04001 (QTY: 1 box)
		0032	08RC6	0700-5510 (QTY: 6)
CURING				
	None			
POLISHING				
6204MA	Polishing paper, 5um (.0002 inch), foam backed, 127 mm x 127 mm (5 inches x 5 inches) min, 50 sheets NSN 5350-01-420-1454	0058	08RC6	0700-2660
			41946	915-05-604
6204MB	Alternate to 6204MA: polishing paper, 5 um (.0002 inch), foam backed, 203 2 mm x 279.4 mm (8 inches x 11 inches) min	0058	64959	105 448 175
6204MC	Polishing paper, 1um, mylar backed sheet, aluminum oxide, 139.7 mm x 139.7 mm (5.5 inches x 5.5 inches) minimum, 50 sheet pack NSN 5350-01-563-5480	0057	08RC6	0700-2620
			41946	915-01-301
6204MD	Alternate to 6204MC: polishing paper, 1 um, mylar backed sheet, alumina, 8 x 11 min	0057	64959	105 076 798
6204ME	Polishing paper, 0.1um, (.000004 inch) mylar backed, diamond, 10 sheets NSN 5350-01-545-0206	0060	078Z1	60-0000-2856-7
			08RC6	0700-2720
6204MF	Alternate to 6204MC when 1 um (.00004 inch) diamond versus alumina: polishing paper, 1 um (.00004 inch), mylar backed diamond, 10 sheet	0057	078Z1	05-1119-8740-7
			08RC6	0700-2805
6204MG	Polishing paper, ultrafine (0.5 um (.000002 inch) silica), 127 mm (5 inch) dia., quantity: 100 sheets	0061	3OCX5	HF5D
SAFETY				
	None			
CONNECTOR ASSEMBLY

REQUIREMENT 6204

TABLE 6204 – III. Connector machine polish equipment and supplies. 1/, 2/, 3/, 4/

Item	Description	Ref No <u>5/</u>	CAGE code	Part number
POLISHER (MACHINE POLISH)				
6204QA	SpecPro 4L base polishing system	N/A	3ZCB8	SP4L
6204QB	4 Position, 1.25mm (.05 inch) ferrule APC polish work holder (for both LC connector and M29504/20 termini) <u>3/</u>	N/A	3ZCB8	4LWH4-67
6204QC	4 Position, 1.25 mm (.05 inch) ferrule PC polish work holder (for LC connector and M29504/18 and M29504/20 termini) <u>1/</u>	N/A	3ZCB8	4LWH4-82
6204QD	4 Position, Size 16 1.587mm (.06 inch) M29504/4 and M29504/5 termini PC polish work holder (termini for MIL-DTL-38999 connector)	N/A	3ZCB8	4LWH4-62
6204QE	4 Position, 2.0 mm (.08 inch) M29504/14 and M29504/15 termini PC polish work holder (termini for MIL-PRF-28876 connector)	N/A	3ZCB8	4LWH4-60
6204QF	4 Position, 2.5 mm (.10 inch) ferrule single fiber ferrule PC polish work holder	N/A	3ZCB8	4LWH4-10
6204QG	4 position, universal PC work holder (for ferrule diameters including 1.25mm (.06 inch), 1.58mm (.06 inch), 2.0mm, (.08 inch) and 2.5mm(.10 inch) and the M29504/4, M29504/5, M29504/14, M29504/15, M29504/18 and M29504/20 termini). This work holder is an alternative for(to replace) 6204QD, 6204QE and 6204QF <u>4/</u>	N/A	3ZCB8	4LWH4-50
POLISHING FILMS (PAPER) FOR MACHINE POLISHER				
6204RA	Polishing Film, 5 micron alumina, 101.6 mm (4 inch) diameter, 1 pack	N/A	3ZCB8	PF05 0A-P
6204RB	Polishing Film, 1 micron alumina, 101.6 mm (4 inch) diameter, 1 pack	N/A	3ZCB8	PF01 0A-P
6204RC	Polishing Film, 1 micron diamond, 101.6 mm (4 inch) diameter, 1 pack	N/A	3ZCB8	PF01 0D-P
6204RD	Polishing Film, 0.1 micron diamond, 101.6 mm (4 inch) diameter, 1 pack	N/A	3ZCB8	PF00.1D-P
6204RE	Polishing Film, 0.3 micron alumina, 101.6 mm (4 inch) diameter, 1 pack	N/A	3ZCB8	PF00.3A-P
POLISHING PADS (FOR MACHINE POLISHER) <u>2/</u>				
6204SA	Polishing Pad, 90 Durometer, 101.6 mm (4 inch) diameter, 1 pack	N/A	3ZCB8	PP-090-4
6204SB	Polishing Pad, 70 Durometer, 101.6 mm (4 inch) diameter, 1 pack	N/A	3ZCB8	PP-070-4
6204SC	Polishing Pad, 40 Durometer, 101.6 mm (4 inch) diameter, 1 pack	N/A	3ZCB8	PP-040-4

1/ Former 4 position, 1.25 mm LC connector work holder, part number 4LWH4-80 has been superseded by Part No. 4LWH4-82 designed to support both the LC connector and the MIL-PRF-29504/18 & MIL-PRF-29504/20 termini.

2/ Polishing pads can be used for hand polishing also.

3/ Former 4 position, 1.25 mm LC connector work holder, part number 4LWH-80 has been superseded by part number 4LWH4-82 to support both the LC connector and the MIL-PRF-29504/18 and MIL-PRF-29504/20 termini.

4/ This work holder is an alternative for (to replace four) work holder models 4LWH4-82, 4LWH-62, 4LWH-60, 4LWH-10(for the 1.25 mm, 1.58 mm, 2.0 mm and 2.5 mm diameter ferrules).

5/ Not specified for surface ships and submarines use. No reference number ("Ref No") referred to in the Navy Shipboard Fiber Optic Recommended Tools List.

w/CHANGE 1

REQUIREMENT 6204

TABLE 6204 – IV. Connector “handheld polisher” equipment and supplies. 1/

Item	Description	Ref No 2/	Cage code	Part number
Polishing (cleaving)				
6204UA	Polishing, hand held, (HHP), ferrule end face (alternative process for 2 nd and 3 rd steps of hand polish on plate)	1	3ET44	HHP-001
6204UB	Polish film cassette/cartridge, HHP, fiber optic, 1.0 micron polish film	N/A	3ET44	111801-1
6204UC	Polish film cassette/cartridge, HHP, fiber optic 0.1 micron polish film	N/A	3ET44	111801-2
6204UD	Backer pad, soft (60A)	N/A	3ET44	112754-1
6204UE	Backer pad, hard (60D)	N/A	3ET44	112754-2
6204UF	Removal tool, backer pad	N/A	3ET44	RTBP-001
6204UG	Tooling chuck 2.5 mm diameter ferrule, ST connector	N/A	3ET44	112757
6204UH	Tooling chuck 1.25 mm diameter ferrule, for LC connector	N/A	3ET44	111908
6204UI	Tooling chuck 1.25 mm diameter ferrule, for MIL-PRF-29504/18 & MIL-PRF-29504/20 termini, chuck for PC polish	N/A	3ET44	111912
6204UJ	Tooling chuck 1.25 mm diameter ferrule, for MIL-PRF-29504/20 terminus, chuck for APC polish	N/A	3ET44	TBD (To Be Determined)
6204UK	Tooling chuck 1.58 mm diameter ferrule, for MIL-PRF-29504/4 (pin), terminus	N/A	3ET44	111902
6204UL	Tooling chuck 1.58 mm diameter ferrule, for MIL-PRF-29504/4 (pin), terminus	N/A	3ET44	111904
6204UM	Tooling chuck 2.0 mm diameter ferrule, for MIL-PRF-29504/14 & MIL-PRF-29504/15 termini	N/A	3ET44	112758
6204UN	Tooling chuck 2.5 mm diameter ferrule, SC connector	N/A	3ET44	111906
6204UO	Tooling chuck 2.5 mm diameter ferrule, FC connector	N/A	3ET44	111910

1/ The hand held polisher is a specific connector polishing machine manufactured by CAGE code 3ET44.

2/ Not specified for surface ships and submarines use. No reference number (“Ref No”) referred to in the Navy Shipboard Fiber Optic Recommended Tools List.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic termination equipment is intended to be used for securing connectors and termini onto the ends of fiber optic cabling that are a part of (1) cable harnesses, (2) fiber optic test jumpers, and (5) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6205

OPTICAL LOSS MEASUREMENT SUPPLEMENTAL ITEMS

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) supplemental items used to perform the optical loss measurement. Included are the items to support the Glenair test probe type MQJ and the test terminus type MQJ. These items are the test probe adapters, test terminus adapters, reference adapters and measurement adapters. To check the operation of the optical source and power meter as a system, the supplemental items includes optical attenuators. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, items to support optical loss measurements. An optical loss measurement is performed in accordance with Method A of TIA/EIA-526-14 (two jumper method) or WP 009 01 of the General Series Maintenance Manual for Fiber Optic Cabling, technical manual identified as [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#). To perform this optical loss measurement with a multiple termini connector, a test probe adapter or a test terminus adapter, as applicable, is mated with the connector to ensure proper MQJ-to-terminus alignment. Also, to perform one step of the optical loss measurement for the two jumper method, a reference adapter is required to mate two MQJ's. In general, the above mentioned and other supplemental items are needed to successfully perform the optical loss measurement (see [6.2](#)).

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

(

2.3 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

TELECOMMUNICATIONS INDUSTRY ASSOCIATION

[TIA/EIA-526-14](#) - Optical Power loss Measurement of Installed Multimode Fiber Optic Plant IEC 61280-4-1 Edition 2, Fibre Optic Communications Subsystem Test Procedure Part 4 – 1: Installed Cable Plant Multimode Attenuation Measurement.

(Copies are available online at www.tiaonline.org or from Telecommunications Industry Association (TIA), 2500 Wilson Boulevard, Suite 300, Arlington VA 22201.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Measurement Quality Jumper (MQJ). The Measurement Quality Jumper (MQJ) is a low loss jumper that is used with test equipment to perform optical loss measurements. The MQJ must meet stringent optical loss requirements to ensure accuracy of measurements performed. Measurements must be accurate and repeatable. The accuracy and repeatability of your measurement is only as good as your MQJ. As the MQJ degrades with use, so does the measurement accuracy. The MQJ consists of a single fiber cable with a connector at one end which mates to the test equipment (optical source and power meter) and a connector at the other end which mates to the link/segment under test.

3.2 Test probe. A single fiber MQJ that is configured with a connector at one end to mate with the test equipment and a connector referred to as "test probe" at the other end. The test probe is test connector that is used to test one terminus at a time within a MIL-DTL-38999 connector. This test probe is inserted into the cavity of a test probe adapter. The test probe adapter is mated to the MIL-DTL-38999 connector.

3.3 Test probe adapter. An adapter that mates with the MIL-DTL-38999 multiple termini connector plug or the MIL-DTL-38999 connector receptacle under test and that contains the insert cavity configuration to mate with and lock a test probe in place.

3.4 Test terminus. A single fiber MQJ that is configured with a connector at one end to mate with the test equipment and a connector referred to as "test terminus" at the other end. The test terminus is test connector that is used to test one terminus at a time within a MIL-PRF-64266 connector. This test terminus is inserted into the cavity of a test terminus adapter. The test terminus adapter is mated to the MIL-PRF-64266 connector.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6205

3.5 Test terminus adapter. An adapter that mates with the MIL-PRF-64266 multiple termini connector plug or the MIL-PRF-64266 connector receptacle under test and that contains the insert cavity configuration to mate with and lock a test terminus in place.

4. Requirements. Fiber optic supplemental items for optical loss testing shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the support equipment to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

4.1 Test adapters for multiple termini connectors.

4.1.1 General. Test adapters shall be configured to mate with the specified multiple termini connector. A plug type test adapter shall be used with the connector receptacle. A receptacle type test adapter shall be used with the connector plug.

4.1.2 MIL-DTL-38999 test probe adapters. Test probe adapters shall be utilized to connect to each type of MIL-DTL-38999 connector receptacle and plug used. [TABLE 6205 – I](#) lists the test probe adapters for commonly used connector configurations. Other test probe adapter configurations may be needed to support “non-standard”, platform specific M38999 connector configurations.

- a. A different plug type test probe adapter is required for each connector receptacle shell size, insert type (cavity for pin or socket terminus) and insert arrangement.
- b. A different receptacle type test probe adapter is required for each connector plug shell size, insert type (cavity for pin or socket terminus), insert arrangement and keying position.

^{1/} Receptacle type test probe adapters are inserted into connector plugs. Plug type test probe adapters are inserted into connector receptacles.

^{2/} Part numbers are listed for receptacle type test probe adapters with keying position "N" unless otherwise indicated. The last character is left blank for a receptacle type test probe adapters with keying position "N". For an alternate keying position, revise the last (fifteenth) character in the part number from a "blank" to the required keying position. Keying positions for a MIL-DTL-38999 series III connector are for N (normal), A, B, C, D, E, F.

^{3/} Part numbers are listed for plug type test probe adapters with keying position "N" unless otherwise indicated. The last character is left blank for a plug type test probe adapters with a universal keying position. See notes ^{4/} and ^{5/} for restriction on use of the universal keying position. For other than a universal position, revise the last (fifteenth) character in the part number from a "blank" to the required keying position. Keying positions for a MIL-DTL-38999 Series III connector are N (normal), A, B, C, D, E, F.

^{4/} Plug adapters/plug type test probe adapters (i.e., test probe adapter configuration that is inserted into connector receptacles) with a universal keying position utilize only one male master key for keying (i.e., keying position). The universal keying position is less preferred due to degradation in optical performance. The advantage is that this "universal key": type plug adapters can be inserted into a receptacle with any keying option (N, A, B, C, D, E, F). Receptacle type test probe adapters cannot be manufactured with the universal keying position.

^{5/} The use of plug type test probe adapters with the adapters with the universal keying position is restricted to legacy applications only. Looser tolerances found on plug adapters with the universal keying position can significantly impact optical loss measurements on single mode fiber sizes (and potentially smaller core multimode fiber sizes). If available (provided with support equipment), plug type test probe adapters with the universal keying position can inadvertently be used on single mode fiber sizes and other measurements where this universal keying position is not authorized.

^{6/} Two adapters are included with this designation number. The part number is modified to account for either an A or B as the fifteenth digit to account for the two adapters. The sixteenth digit (rather than the fifteenth digit) is used for alternate keying positions.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6205

4.1.3 MIL-PRF-64266 test terminus adapter. One test terminus adapter is required for each type of connector receptacle and connector plug (one for the connector plug and one for the connector receptacle of each shell size). [TABLE 6205-II](#) lists the test terminus adapters for each shell size.

- a. Design characteristics. Test terminus adapters for use with the MIL-PRF-64266 connector receptacles shall conform to MIL-PRF-64266/32. Test terminus adapters for use with the MIL-PRF-64266 connector plugs shall conform to MIL-PRF-64266/33.
- b. Interfacing termini. The applicable MIL-PRF-29504 for use with this test terminus adapter are the MIL-PRF-29504/18 and MIL-PRF-29504/20 termini.
- c. Part number. Test terminus adapter shall be marked with the PIN and the vendor part number.
- d. Insert cavity marking. Insert cavity shall be marked with the cavity number. For shell sizes with two cavity configurations, the same cavity location shall be marked with both cavity numbers.

TABLE 6205-II. MIL-PRF-64266 test terminus adapter configurations.

Item number	Adapter type 1/	Shell size	No. of insert cavities 4/	ASR Provided	Keying position 2/	Cage code	Part number
6205EA	Plug	11	2, 4	No	N/A	53669	1021898-B2NGH
6205EB	Receptacle	11	2, 4	Yes	N/A	53669	1021898-B2YGH
6205GC	Plug 3/	13	6	No	N/A	53669	1021898-C2NGH
6205GD	Receptacle 3	13	6	Yes	N/A	53669	1021898-C2YGH
6205EC	Plug	15	8, 10	No	N/A	53669	1021898-D2NGH
6205ED	Receptacle	15	8, 10	Yes	N/A	53669	1021898-D2YGH
6205EE	Plug	23	36, 18	No	N/A	53669	1021898-H2NGH
6205EF	Receptacle	23	36, 18	Yes	N/A	53669	1021898-H2YGH

1/ Receptacle type connector probe adapters are inserted into plug connectors. Plug type connector probe adapters are inserted into receptacle connectors.

2/ Not applicable. Each connector problem adapter shall contain keying for all 12 keying positions.

3/ Less commonly used insert configurations (not preferred for standardization reasons).

4/ Connectors with the same shell size and different number of insert cavities have the same insert cavity locations. For instance, this allows a shell size 11 test terminus adapter to be used with a connector having either a 2 or 4 cavity insert.

4.2 Construction, test probe adapter.

4.2.1 Metal housing. Aluminum with a finish of anodized aluminum is acceptable. Other configurations shall require approval by the Design Activity. Past practice was to specify aluminum with cadmium over electroless nickel. Currently, most platforms are prohibiting the use of a cadmium finish for new items and replacements.

4.2.2 Geometry of test probe adapters. Test probe adapter shall be interchangeable with the applicable MIL-DTL-38999 Series I and III connector receptacle or plug.

- a. Test probe adapter for each connector plug and connector receptacle shell size and insert arrangement shall have a keying arrangement for the specified clocking position.
- b. Alignment sleeve. Split ceramic sleeve shall be used (when applicable).
- c. Other metal parts. Corrosive resistant materials shall be used.

4.2.3 Geometry and design. Geometry and design shall ensure interchangeability with the specified connector receptacles and plugs, the applicable MIL-PRF-29504 termini and the applicable test probe.

- a. The MIL-DTL-38999 series III connector receptacles and plugs when MIL-PRF-29504/4 and MIL-PRF-29504/5 termini are used.

4.2.4 Design characteristics. Design characteristics are to perform the following functions:

- a. The plug type, test probe adapter shall mate with both the specified test probe and specific multiple termini connector receptacle configuration.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6205

- b. The receptacle type, test probe adapter shall mate with both the specified test probe and specific multiple termini connector plug configuration.
- c. The test probe adapter shall comply with the corresponding insert arrangement specified (such as MIL-STD-1560 for inserts used in MIL-DTL-38999 connectors).
- d. The test probe adapter shall have a positive test probe retention mechanism to ensure that the test probe locks in place upon insertion.
- e. The plug type, test probe adapter shall be designed to house the appropriate mating ceramic alignment sleeves as defined in [MIL-PRF-29504](#).
- f. The test probe adapter shall be designed to have a master key (or keyway) and specified polarization key (or keyway) to mate with the specified clocking key (keyway) position for the connector configuration.

4.2.5 Part number. Test probe adapters shall be marked with the vendor part number.

4.3 Reference adapters. Reference adapters shall conform to 4.3.1 to 4.3.3. [TABLE 6205-III](#) lists the acceptable configuration for these adapters.

4.3.1 Types.

- a. Reference adapter, test probe-to-test probe. This type reference adapter shall be used to mate two test-probe-to-test probe connectors.
- b. Reference adapter, hybrid (or hybrid adapter). This type reference adapter shall be used to mate two single ferrule connectors with the same ferrule diameter, but different connector configuration) such as SC-to-ST adapter).
- c. Reference adapter, stepped alignment sleeve. This type reference adapter shall be used to mate two connectors with different ferrule diameters (such as mating a test probe connector to a ST connector).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6205

4.3.2 Construction of reference adapter, test probe-to-test probe.

- a. Metal housing. Aluminum, stainless steel or nickel plated brass are acceptable. Other configurations shall require approval by the Design Activity.
- b. Optical performance. Test probe - to- test probe interface loss shall not exceed the specified dB limit listed in [TABLE 6207 - I](#).
- c. Alignment sleeve. Split ceramic sleeve shall be used.
- d. Other metal parts. Corrosive resisting materials shall be used.
- e. Geometry and design shall be intermateabel with the specified test probe for the applicable MIL-PRF-29504 termini.
- f. Design characteristics shall be incorporated to perform the following functions:
 - (1) The reference adapter shall be designed to mate two of the same type test probes.
 - (2) The reference adapter shall have a positive test probe retention mechanism to ensure that the test probe locks in place upon insertion.
 - (3) The reference adapter shall be designed to house the appropriate mating ceramic alignment sleeves as defined in [MIL-PRF-29504](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6205

4.3.3 Part number. When specified, vendor part number shall be marked on the reference adapter.

4.4 Measurement adapters. Measurement adapters shall conform to 4.3.1 to 4.3.3. TABLE 6205-IV lists the acceptable configurations for these measurement adapters.

TABLE 6205 – IV. Measurement adapter configuration and vendor PIN.

Item number	Configuration	CAGE code	Vendor part number
6205NA	Measurement adapter, test probe-to-M29504/4 pin terminus	06324	180-049C
6205NB	Measurement adapter, test probe-to-M29504/5 socket terminus	06324	180-050C

4.4.1 Type.

a. Measurement adapter, terminus-to-test probe. This type measurement adapter shall be used to mate terminus-to-test probe connectors.

4.4.2 Construction of measurement adapter, test probe-to-test probe.

- Metal housing. Aluminum, stainless steel or nickel plated brass are acceptable. Other configurations shall require approval by the design activity.
- Optical performance. Test probe-to-test probe interface loss shall not exceed the specified dB listed in [TABLE 6207 - I](#). Connection loss acceptance criteria.
- Alignment sleeve. Split ceramic sleeve shall be used.
- Other metal parts. Corrosive resisting materials shall be used.
- Geometry and design shall be interchangeable with the specified test probe. For instance, the test probe for the MIL-DTL-38999 Series III connector receptacles and plugs shall be interchangeable with MIL-PRF-29504/4 and MIL-PRF-29504/5 termini.

4.4.3 Design characteristics. Design characteristics shall be incorporated to perform the following functions:

- The measurement adapter shall be designed to mate two of the same type test probes.
- The measurement adapter shall have a positive test probe retention mechanism to ensure that the test probe locks in place upon insertion.
- The measurement adapter shall be designed to house the appropriate mating ceramic alignment sleeves as defined in [MIL-PRF-29504](#).

4.4.4 Part number. When specified, vendor part number shall be marked on the measurement adapter.4.5 Attenuators. Attenuators provided shall be those listed in TABLE 6205 – V.TABLE 6205 - V. Attenuators and vendor part number.

Item number	Configuration	CAGE code	Vendor part number
6205PA	Attenuator, MM, fixed, -3 dB, 850 nm, ST interface	4TA86	ATP-STU-03-62-85
6205PB	Attenuator, MM, fixed, -3 dB, 1,300 nm, ST interface	4TA86	ATP-STU-03-62-13
6205PC	Attenuator, SM, fixed, -3 dB, 1,550 nm, ST interface	4TA86	ATP-STU-03-SM

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic supplemental items used shall be restricted to those in [TABLE 6205 – I](#) through [TABLE 6205 - V](#). These fiber optic supplemental items are used for optical loss testing for a fiber optic cable harness, those to transition to end user equipment interfacing with the cable harness, and those on patch cords.

6. Notes.

6.1 Intended use. The supplemental equipment provides the cabling interface connections used when measuring the optical performance for fiber optic cabling that are a part of (1) cable harnesses, (2) fiber optic test jumpers, and (5) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6205

6.2 Use of and listing for supplemental items. Further elaboration for identifying the use of the supplemental items and the location of a table for each type supplemental item is provided in 6.2.a through 6.2.e.

- a. Types of MQJ's. MQJ configurations are addressed in Requirement 6207. Refer to materials table in WP 009 01 of [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#) for examples of MQJ configurations used.
- b. Types of test probe adapters. Test probe adapters are used with MQJ configurations that have test probe connectors on one end. MIL-STD-1678 designations for the test probe adapters are listed in TABLE 6205 – I for MIL-DTL-38999 connectors. Cross reference of the test probe adapter to a MIL-DTL-38999 connector is listed in [TABLE 6205A – I](#) in appendix A.
- c. Types of test terminus adapters. Test terminus adapters are used with MQJ configurations that have test terminus connectors on one end. MIL-STD-1678 designations for the test terminus adapters are listed in [TABLE 6205-II](#) for MIL-PRF-64266 connectors. Cross reference of the test terminus adapter to a MIL-PRF-64266 connector is listed in [TABLE 6205A-II](#) in appendix A.
- d. Types of reference adapters. Reference adapters are used in the second power measurement step during an optical loss measurement when the two-jumper method is performed. The applicable configuration, reference adapter is used to mate two MQJ's. Reference adapters are listed in [TABLE 6205 - III](#).
- e. Types of measurement adapters. Measurement adapters are used in the test measurement step during an optical loss measurement. The applicable configuration, measurement adapter is used to mate two MQJ's. Measurement adapters are listed in [TABLE 6205 – IV](#).
- f. Attenuators. Attenuators are used to verify adequate operation of the optical source and power meter used as a system in performance of the optical loss measurement. The applicable attenuators are listed in [TABLE 6205 - V](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6205

APPENDIX A

TEST ADAPTER CROSS REFERENCE TO THE MULTIPLE TERMINI CONNECTOR

A.1 Intent.

A.1.1 Connector cross reference. A table is provided for the MIL-DTL-38999 Series III connector and for the MIL-PRF-64266 connector to cross reference the test probe adapter or test terminus adapter to the applicable connector configuration.

A.2 Applicable documents.

A.2.1 General. The documents listed in this section are specified in A3 of this standard practice. This section does not include comments cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in section A.3 of this standard practice, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards and handbooks. The following specifications, standards and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of the documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

[MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for

REQUIREMENT 6206

CONNECTOR ACCESSORIES ASSEMBLY AND REPAIR TOOLS AND EQUIPMENT

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) consisting of the tools and equipment required for the assembly and repair of connector accessories. Included in these tools and equipment are the tools to assemble a backshell onto a multiple terminus connector, terminus termination insertion and removal tools, adapters used during the connector accessories assembly and connector assembly consumable supplies. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-PRF-29504/4	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Pin Terminus, Size 16, Rear Release, MIL-DTL-38999, Series III.
MIL-PRF-29504/5	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Socket Terminus, Size 16, Rear Release, MIL-DTL-38999, Series III.
MIL-PRF-29504/18	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Genderless Terminus, Rear Release, Ceramic Ferrule, 1.25 MM Ferrule, (for MIL-PRF-64266 Connectors).
MIL-PRF-64266	-	Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for
MIL-DTL-38999	-	Connectors, Electrical, Circular, Miniature, High Density, Quick Disconnect, (Bayonet Threaded and Breech Coupling), General Specification for.

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM1-1500-232-24-4	-	Installation and Testing Practices, Aircraft Fiber Optic Cabling.

Navy Shipboard Fiber Optic Recommended Test Equipment List

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for tools) that may be applicable to the logistic support requirements for the specified test equipment. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6206

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Adapter tool. An adapter that mates with the multiple termini connector plug or the connector receptacle under assembly and along with a ratchet or T-handle holds the front of the connector from turning while tightening the backshell or EMI retention nut in place.

3.2 Backshell, fiber optic. The shroud or protective structure placed on the cable entry end of the multiple termini connector that provides mechanical protection of the fiber optic cable at the exit (cable entry end) of the connector. For protective cable harnesses with single fiber cabling, the backshell is used to interface the protective covering or cable strain relief of the cable harness with the connector. The backshell is also used to provide a degree of environmental sealing, depending upon the specific design.

3.3 Banding strap. A stainless steel, adjustable, tie-down band used to secure cable wrap to the banding platform of the backshell rear adapter. The banding strap includes a self-clinching clamp to hold the band in place in the longitudinal (long) direction.

3.4 EMI retention nut, fiber optic. A component placed on the cable entry end of the multiple termini connector in lieu of a backshell to provide environmental protection from entry or penetration of electromagnetic radiation. A common application for an EMI retention nut is one used in conjunction with a connector receptacle at the panel of an equipment module.

4. Requirements. Fiber optic support equipment (SE) for the tools, adapters, and consumable supplies used to assemble and repair fiber optic connector accessories shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the support equipment to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, tools, adapters, and consumable supplies used to assemble and repair fiber optic connector accessories shall be restricted to those in TABLE 6206 – I through [TABLE 6206-V](#).

TABLE 6206 – I. Connector accessories assembly tools.

Item	Description <u>1/</u>	Ref No <u>7/</u>	Cage code	Part number
6206AA	Torque wrench, 0 – 22.6 N m (0 – 200 inch-pound), .952 mm (.375 inch) square drive socket, NSN 5120-001-335-8178	0128	11851	BT-ST-751

			0YPM2	FSTS1006-1
			06324	182-026
6206CE	Insertion tool, metal, MIL-PRF-29504/4 and MIL-PRF-29504/5	N/A	81349	M81969/8-07
6206CF	Insertion & removal tool, plastic, MIL-PRF-29504/4 & MIL-PRF-29504/5	N/A	81349	M81969/14-03
6206CG	Removal tool, metal, MIL-PRF-29504/4 and MIL-PRF-29504/5	N/A	81349	M81969/8-08
6206CH	Termini assist removal tool for M29504/4 and MIL-PRF-29504/5 (optional) <u>1/</u>	N/A	08RC6	0721-1150
6206CI	Removal tool, tweezers style for MIL-PRF-29504/18 and MIL-PRF-29504/20 termini	0125	08RC6	0701-3855
6206CJ	Removal tool, MIL-PRF-29504/14, /15 termini	0065	N/A	N/A
6206CK	Insertion/removal tool, MIL-PRF-29504/15 alignment sleeve	0042	N/A	N/A

1/ The termini assist removal tool is used in conjunction with the rear release removal (extraction) tool. The termini assist tool has one end for the M29504/4 pin terminus and the other end is for the M29504/5 socket terminus. The termini assist tool pushes the pin or socket termini, from the front side of the connector, up above the internal locking ring after the removal tool is fully seated.

2/ For surface ships and submarines, use the terminus insertion and removal tools and vendors (approved sources of supply) listed in the Navy Shipboard Fiber Optic Recommended Tools List, see 2.3. Each reference number ("Ref No") refers to the specific terminus insertion and removal tools in the Navy Shipboard Fiber Optic Recommended Tools List.

REQUIREMENT 6206

TABLE 6206-V. Connector assembly consumable supplies.

Item	Description	Quantity	Cage code	Part number
6206JA	Knife, utility, metal, retractable, adjustable push button, with heavy duty blade, NSN 5110-01-538-3943	1	2E624	X3274
6206JB	Handle, surgical knife, detachable blade, size 9, narrow nose (for use with 6206JC and 6206JD), NSN 6515-00-344-7920	1	00WU8	
6206JC	Blade, surgical knife, detachable # 11, sterile, straight taper, pack of 6 blades, NSN 6515-00-660-0010	1	00WU8	
6206JD	Blade, surgical knife, detachable # 15, sterile, curved taper, pack of 6 blades, NSN 6515-00-660-0010	1	00WU8	
	Cleaning consumable supplies <u>1/</u>			
	Cable assembly consumable supplies <u>2/</u>			

1/ Cleaning supplies are listed in [Requirement 6201](#).

2/ Tape, heat shrink sleeving, banding straps and other materials used for cabling assembly are listed in [TABLE 6108 – I](#) of Requirement 6108.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic tools, adapters, and consumable supplies intended to be used to assemble and repair fiber optic connector accessories on (1) cable harnesses, (2) fiber optic test jumpers, and (3) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6207

MEASURE QUALITY JUMPERS

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) Measurement Quality Jumpers (MQJ) used to perform the optical loss measurement and the OTDR measurement. This requirement addresses the general construction of and different configurations for the MQJ. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, general construction requirements. The MQJ is a fiber optic test jumper or cable that conforms to the low loss optical and other requirements specified herein. The MQJ is used with test equipment including the performance of optical loss measurements using an optical source and power meter and including OTDR measurements.

- a. MQJ configurations for optical loss measurements. Each MQJ is configured as single fiber cable with a connector at one end that mates to the test equipment and a connector at the other end which mates to the link/segment under test. The MQJ is used to test one channel at a time on the cable link/segment under test. For a multiple termini connector, a test probe for a MIL-DTL-38999 connector) or a test terminus (for a MIL-PRF-64266 connector) is placed on the end of the MQJ that mates with a terminus in a multiple termini connector. A test probe adapter (for a MIL-DTL-38999 connector) or a test terminus adapter (for a MIL-PRF-64266 connector), which is screwed onto the multiple termini connector, is addressed under Support Equipment (SE) in [Requirement 6205](#).
- b. MQJ configurations for OTDR measurements. For an OTDR measurement taken with the high resolution module (such as a module with a nominal 10 centimeter (3.94 inch) or less dead zone), a MQJ with the 2 meter (6.56 foot) length is used. For an OTDR measurement taken using a standard resolution module (i.e., a module with a 3 meter (9.84 foot) to 15 meter (49.2 foot) dead zone), a MQJ with a 50 meter (164 foot) length is used. These measurements are performed on fiber optic cable links (fiber optic cable run between equipment modules/boxes) that may consist of one or more segments (cabling with connectors on both ends). This testing is performed to verify optical performance of installed cable, to characterize the cabling geometry, or to troubleshoot the cable links. To avoid confusion between the 2 meter (6.56 foot) and 50 meter (164 foot) lengths, MQJ configurations with a 2 meter (6.56 foot) length are placed in [appendix A](#) whereas those with a 50 meter (164 foot) length are in [appendix B](#).
- c. Measurement accuracy. The MQJ must meet stringent optical loss requirements to ensure accuracy of measurements performed. Measurements made must be accurate and repeatable. For an optical loss measurement, the accuracy and repeatability of your optical loss measurement is only as good as your MQJ. As the MQJ degrades with use, so does the measurement accuracy.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Measurement Quality Jumper (MQJ). The Measurement Quality Jumper (MQJ) is a low loss jumper that is used with test equipment to perform optical loss measurements. The MQJ must meet stringent optical loss requirements to ensure accuracy of measurements performed. Measurements must be accurate and repeatable. The accuracy and repeatability of your measurement is only as good as your MQJ. As the MQJ degrades with use, so does the measurement accuracy. The MQJ consists of a single fiber cable with a connector at one end which mates to the test equipment (optical source and power meter) and a connector at the other end which mates to the link/segment under test.

3.2 Test probe. A single fiber MQJ that is configured with a connector at one end to mate with the test equipment and a connector referred to as "test probe" at the other end. The test probe is test connector that is used to test one terminus at a time within a MIL-DTL-38999 connector. This test probe is inserted into the cavity of a test probe adapter. The test probe adapter is mated to the MIL-DTL-38999 connector.

3.3 Test probe adapter. An adapter that mates with the MIL-DTL-38999 multiple termini connector plug or the MIL-DTL-38999 connector receptacle under test and that contains the insert cavity configuration to mate with and lock a test probe in place.

3.4 Test terminus. A single fiber MQJ that is configured with a connector at one end to mate with the test equipment and a connector referred to as "test terminus" at the other end. The test terminus is test connector that is used to test one terminus at a time within a MIL-PRF-64266 connector. This test terminus is inserted into the cavity of a test terminus adapter. The test terminus adapter is mated to the MIL-PRF-64266 connector.

3.5 Test terminus adapter. An adapter that mates with the MIL-PRF-64266 multiple termini connector plug or the MIL-PRF-64266 connector receptacle under test and that contains the insert cavity configuration to mate with and lock a test terminus in place.

4. Requirements. Fiber optic Measurement Quality Jumpers used to perform the optical loss measurement and the OTDR measurement shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the support equipment to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

4.1 MQJ configurations. MQJ's shall be provided in one or more of the configurations specified in 4.1.1 and 4.1.2.

4.1.1 Single ferrule connector on each end. This MQJ configuration is used to test fiber optic cable segments and links when at least one end of the cable is terminated with single ferrule connectors (such as the ST and FC connectors).

- a. ST and FC connectors. When at least one end of the cable segment or cable link under test is terminated with ST connectors or FC connectors, the MQJ can be attached to the segment/link by means of a ST-to-ST adapter or FC-to-FC adapter.
- b. Hybrid adapters. For use when different style connectors are on the cable segment/link than on the MQJ. For instance, use a FC-to-ST hybrid adapter when connecting a ST connector MQJ to a cable terminated with an FC connector.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6207

4.1.2 Test probe/test terminus on one end. This MQJ is used to test cable segments and cable links with a multiple termini connector on at least one end. The test probe and test terminus are designed to mate with specific termini types.

- a. Test probe. The MIL-DTL-38999 connector contains MIL-PRF-29504/4 and MIL-PRF-29504/5 termini. The test probe used is compatible with these type termini.
- b. Test terminus. The MIL-64266 connector contains the MIL-PRF-29504/18 or MIL-PRF-29504/20 fiber optic termini. The test terminus used is compatible with these type termini.

4.2 Component requirements.

4.2.1 Single fiber, single mode cable. Cable with single mode optical fiber in accordance with [TIA-492CAAA](#), 900 ± 50 micron buffer, shall be used for the 9/125 micron fiber size. Cable with 5/125 micron fiber size shall have optical fiber that conforms to OFS part number C10026 or BC06814. The single fiber cable shall consist of a buffered fiber surrounded with a concentric layer of yarn strength members and polymer jacket. Single fiber cable shall be of sufficiently robust construction to permit frequent handling and have a minimum diameter of 2 mm (.08 inch) nominal. Cable shall have an operating temperature of -28 to 65°C. Bending, including while at the temperature extremes, shall not impact optical performance. Flash exposure to fluids commonly used around aircraft and ships shall not degrade the cable jacket.

4.2.2 Single fiber, multimode cable. Cable with multimode optical fiber, 900 ± 50 micron buffer, shall be used. The single fiber cable shall consist of a buffered fiber surrounded with a concentric layer of yarn strength members and polymer jacket. Single fiber cable shall be of sufficiently robust construction to permit frequent handling and have a minimum diameter of 2 mm (.08 inch) nominal. Cable shall have an operating temperature of -28°C to +65°C. Multimode optical fiber shall be in accordance with [TIA-492AAAB](#) for the 50/125 micron fiber size, in accordance with [TIA-492AAAA](#) for the 62.5/125 micron fiber size and in accordance with [IEC-60793-2](#) (Annex C) for the 100/140 micron fiber size. OFS optical fiber BF06819 or OFS fiber optic cable C16133 shall be used for the 42.5/125 micron fiber size (required for the MQJ of a 50/125 micron fiber restricted launch cable). Bending, including while at the temperature extremes, shall not impact optical performance. Flash exposure to fluids commonly used around aircraft and ships shall not degrade the cable jacket.

4.2.3 Single ferrule connectors. ST and FC connectors shall have:

- a. Ceramic ferrule (no plastic or metal ferrules) with domed end face.
- b. Metal housing (also referred to as: bayonet cap or coupling nut) and ferrule/crimp sleeve support (also referred to as: barrel or body). Stainless steel or nickel plated brass are acceptable.
- c. Crimp sleeve (ring) capture mechanism for cable yarn strength member rated for a minimum tensile loading of 9.07 kg (20 pounds).
- d. Cavity for accepting an externally injected adhesive (two part epoxy) during cable assembly fabrication using a 20 gauge syringe tip.
- e. Geometry conforming to [TIA-604-2](#) fiber optic connector intermateability standard for the ST connector and conforming to [TIA-604-4](#) for the FC connector.

4.2.4 Test probe. Test probe shall have:

- a. Ceramic ferrule (no plastic or metal ferrules) with domed end face.
- b. Metal housing. Stainless steel or nickel plated brass are acceptable.
- c. Crimp sleeve (ring) capture mechanism for cable yarn strength member rated for a minimum tensile loading of 9.07 kg (20 pounds).
- d. Cavity for accepting an externally injected adhesive during cable assembly fabrication using a 20 gauge syringe tip.
- e. Ferrule diameter and concentricity conforming to [MIL-PRF-29504/4](#).
- f. Geometry and design that is intermateable with specified connector receptacles and plugs when inserted into applicable connector probe adapter.
 - (1) The MIL-DTL-38999 Series III connector receptacles and plugs when MIL-PRF-29504/4 and MIL-PRF-29504/5 termini are used.
- g. Design characteristics to perform the following functions:
 - (1) The test probe and mating test probe adapter shall be designed to maintain a minimum .508 mm (.020 inch) compression upon insertion of the test probe. The intent of this compression is such that a positive pressure is retained between the test probe and mating terminus end faces.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6207

4.2.5 Test terminus. Test terminus shall conform to [MIL-PRF-29504/21](#).

4.3 Optical performance.

4.3.1 Optical loss. When tested to WP 009 03 of the General Series Maintenance Manual for Fiber Optic Cabling, technical manual identified as [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#), or Method 6F1 of [MIL-STD-2042](#), the connection loss at the reference jumper-to-test jumper interface shall not exceed the values listed in TABLE 6207 - I. Testing shall be performed using an overfilled launch condition.

TABLE 6207 - I. Connection loss acceptance criteria.

Connection interface type and fiber size (microns)	Maximum acceptable connection loss (dB)	Maximum acceptable standard deviation (dB)
ST or FC with 5.8/125	0.35	0.10
ST or FC with 7.5/125	0.35	0.10
ST or FC with 9/125	0.35	0.10
ST or FC with 50/125	0.50	0.05
ST or FC with 62.5/125	0.35	0.05
ST or FC with 100/140	0.50	0.05
Test probe with 5.8/125	0.50	0.10
Test probe with 7.5/125	0.50	0.10
Test probe with 9/125	0.50	0.10
Test probe with 50/125	0.50	0.05
Test probe with 62.5/125	0.35	0.05
Test probe with 100/140	0.35	0.05
Test terminus with 9/125	0.50	0.10
Test terminus with 50/125	0.50	0.05
Test terminus with 62.5/125	0.50	0.05
Test terminus with 100/140	0.50	0.05

4.3.2 Return loss (for single mode only). When tested to Method 6K1 of [MIL-STD-2042](#), the return loss at the reference jumper-to-test jumper interface shall not exceed the values listed in TABLE 6207 - II.

TABLE 6207 - II. Return loss acceptance criteria.

Connection interface type	Minimum acceptable return loss with standard polish (dB)	Minimum acceptable return loss with enhanced polish (dB)
ST or FC	33	43
Test probe	33	43
Test terminus	33	43

4.4 Markings.

4.4.1 Identification label. The MQJ shall be visibly marked with the following: "MQJ", the vendor name, CAGE Code or trade mark, and the vendor part number.

4.5 Color code by fiber size.

- MQJ with 5.8/125 micron, single mode fiber shall be constructed with cable containing a yellow outer jacket.
- MQJ with 7.5/125 micron, single mode fiber shall be constructed with cable containing a yellow outer jacket.
- MQJ with 9/125 micron, single mode fiber shall be constructed with cable containing a yellow outer jacket.
- MQJ with 50/125 micron, multimode fiber shall be constructed with cable containing a white outer jacket.
- MQJ with 62.5/125 micron, multimode fiber shall be constructed with cable containing a gray (slate) outer jacket.
- MQJ with 100/140 micron, multimode fiber shall be constructed with cable containing a green outer jacket.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6207

4.6 Fabrication requirements.

4.6.1 Fabrication method. Each MQJ is to be fabricated to meet the specified construction and connector end face geometry. The fabrication method is to include the use of a heat cured epoxy to bond the optical fiber inside the ferrule and a polishing procedure to obtain the connector end face geometry specified below. Procedures in WP 010 of the General Series Maintenance Manual for Fiber Optic Cabling, technical manual identified as [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-323-24-4](#) or in Part 5 of [MIL-STD-2042](#) may be used as a guideline.

4.6.2 Connector end face geometry. Acceptance criteria for the MQJ are to include: (1) Verification that the ferrule end face is domed within the specified ranges for the radius of curvature and for the apex offset. (2) Verification that the fiber height either meets the criteria for an APC, PC or NC polish, whichever is specified for that particular MQJ. End face geometry for each connector on a MQJ shall conform to the applicable, specified parameter limits in accordance with Measurement 5201 of [MIL-STD-1678-5](#). Measurements are to be performed in accordance with appendix B of Measurement 5201.

- a. MQJ without a test probe/test terminus. Polish on both ends shall be as specified in the applicable table for connectors at both ends.
- b. MQJ with a test probe/test terminus at one end. Polish on the test probe/test terminus end shall be as specified in the applicable table. Polish on the non-test probe/non-test terminus shall be a PC polish.

4.6.3 Cable length. Unless otherwise specified for a particular MQJ construction, the MQJ length specified shall be the length measured from the ferrule end face (tip) on each connector end (tip-to-tip length). A different appendix is provided in Requirement 6207 for each specified cable length.

- a. Tolerance. Tolerance from the nominal cable length specified shall be 0.5 meters (1.6 foot) on the 2 meter (6.6 foot) length and 2 meters (6.6 foot) on the 50 meter (164 foot) length. If a one meter (3.3 foot) length is specified, the tolerance from the nominal length shall be 0.13 meters (0.4 foot).

4.6.4 Restricted launch fabrication. This fabrication is applicable for a MQJ launch end optical loss (OL) measurement on a 50/125 micron or a 62.5/125 micron fiber size system in which the aircraft platform specifies the measurement is to be done using a restricted launch condition.

- a. 50/125 micron fiber size. For a 2 meter (6.6 foot) total length MQJ, the MQJ is to be fabricated with a 2 meter (6.6 foot) length of 42.5/125 micron fiber that is fusion spliced to a short piece of 50/125 micron fiber. There is no restricted launch configuration for a 50 meter (164 foot) length MQJ.
- b. 62.5/125 micron fiber size. For a 2 meter (6.6 foot) total length MQJ, the MQJ is to be fabricated with a 2 meter (6.6 foot) length of 50/125 micron fiber that is fusion spliced to a short piece of 62.5/125 micron fiber. There is no restricted launch configuration for a 50 meter (164 foot) length MQJ.
- c. The MQJ shall be fabricated with the fusion splice within one of the connectors. Label shall be placed on the end without the fusion splice with the words "SOURCE END".
- d. If a test probe/test terminus MQJ is being constructed, the test probe/test terminus shall be affixed to the end with the larger fiber size (fusion spliced end).
- e. Identification label shall include the words "RESTRICTED LAUNCH MQJ" instead of "MQJ".

5. Implementation. Unless otherwise specified by the applicable Platform Office, Measurement Quality Jumpers used to perform the optical loss measurement and the OTDR measurement shall be restricted to those in appendices A and B.

5.1 Verification of requirements.

5.1.1 Responsibility. Unless otherwise specified by the acquiring activity, the supplier is responsible for the performance of all items contained herein with regard to the above requirements.

5.1.2 Optical performance and visual inspection verification. Test data may be provided to demonstrate performance; however, the acquiring activity reserves the right to perform any of the inspections specified. When specified, test samples shall be submitted to the design activity for approval.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6207

6. Notes.

6.1 Intended use. The fiber optic MQJs are intended to be used as the test jumpers to measure the optical loss on (1) cable harnesses, (2) other fiber optic test jumpers, and (3) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6207

APPENDIX A

MQJ CONFIGURATIONS WITH A 2 METER LENGTH

A.1 Intent.

A.1.1 Test equipment. MQJ configurations with a 2 meter (6.6 foot) length are intended to be used as the test jumpers for performing optical loss measurements with an optical source and power meter and for performing OTDR measurements (such as length determinations) with an OTDR containing an OTDR high resolution module. An OTDR high resolution module is one with a nominal 10 centimeter (3.94 inch) or less dead zone.

A.1.2 Length. A 2 meter (6.6 foot) jumper length was determined to be sufficient to reach from the test equipment to the cabling being accessed in almost all of the most remote locations in the aircraft. Two meters (6.6 foot) was determined to be the length in which to standardized the MQJ for the types of measurements listed in A.1.1. Note that 1 meter (3.3 foot) is a sufficient length; however, a 2 meter (6.6 foot) length is preferred to cover most space (location) constraints. For instances where two operators are obtaining the measurement (one reaching into a more inaccessible location going from terminus to terminus within the multiple termini connector, the other monitoring each measurement obtained outside the inaccessible location or outside the aircraft), is one example cited that necessitates the need for a 2 meter (6.6 foot) length.

A.2 Applicable documents.

A.2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-PRF-64266	-	Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for
MIL-DTL-38999	-	Connectors, Electrical, Circular, Miniature, High Density, Quick Disconnect, (Bayonet Threaded and Breech Coupling), General Specification for.

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

A.2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

A.3 Requirements.

A.3.1 Configuration. The selected MQJ configuration for the specific fiber size and connectors on each end of the cable will be in conformance with the ferrule end face polish, cable length, and launch conditions as specified in [TABLE 6207A - I](#).

A.3.2 Construction. The MQJ construction will conform to [4.2](#) through [4.6](#), as applicable for the specific MQJ configuration.

A.4 Implementation. MQJs shall conform to 5.0 of Requirement 6207 using [TABLE 6207A - I](#) or part of the verification (see [5.1](#)).

^{1/} Applications to select only a MQJ with PC polish: Optical loss unless otherwise specified, Return Loss, ODTR using a high resolution module.

^{2/} Applications to select an overfilled launch MQJ: Detector end MQJ for optical loss test, when specified Launch end MQJ for optical loss test, launch end MQJ for return loss test, OTDR measurement using a high resolution module.

^{3/} Applications to select a restricted launch MQJ: When specified launch end MQJ for optical loss test.

^{4/} Polish type shall conform to APC, E = domed end face with an enhanced APC polish; PC,S=domed ferrule with a standard PC polish; or NC,S=flat ferrule with a standard NC polish. Ferrule end face shall meet end face geometry for the specified polish type (see 4.6.2, Connector end face geometry). Acceptance criteria for the MQJ are to include: (1) Verification that the ferrule end face is fabricated to conform with specified end face geometry. Method used to polish during fabrication shall conform to 4.6.1.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6207

APPENDIX B

MQJ CONFIGURATIONS WITH A 50 METER LENGTH

B.1 Intent

B.1.1 Test equipment. MQJ configurations with a 50 meter (164 foot) length are intended to be used as the test jumpers for performing OTDR measurements (such as length determinations) with an OTDR containing an OTDR standard resolution module. An OTDR standard resolution module is one with a 3 to 15 meter (9.84 foot to 49.21 foot) dead zone. For aircraft applications where the maximum cable run being measured is less than 152 meters (500 feet) in length, the standard OTDR module selected is one with a short to medium range and higher resolution. The MQJ length specified is intended for use with this type of standard resolution module.

B.1.2 Length. The MQJ with a 50 meter (164 foot) length serves two functions. One function is to be a low loss, optical test jumper that interfaces the OTDR optical test port with the cable link(s) under test, undergoing troubleshooting, or that are being characterized. This first function does not depend on the cable length. The second function is to be of sufficient length so that the connection at the OTDR optical test port can be distinguished from that of the first connection at the cable under test. For use with the OTDR standard resolution module described in [B.1.1](#), a length of 50 meters (164 foot) is specified. For this function, the MQJ may be referred to as a dead zone cable.

B.2 Applicable documents

B.2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

B.2.2 Government documents

B.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for
- [MIL-DTL-38999](#) - Connectors, Electrical, Circular, Miniature, High Density, Quick Disconnect, (Bayonet Threaded and Breech Coupling), General Specification for.

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

B.2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

B.3 Requirements

B.3.1 Configuration. The selected MQJ configuration for the specific fiber size and connectors on each end of the cable will be in conformance with the ferrule end face polish, cable length, and launch conditions as specified in [TABLE 6207B - I](#).

B.3.2 Construction. The MQJ construction will conform to [4.2](#) through [4.6](#), as applicable for the specific MQJ configuration.

B.4 Implementation. MQJs shall conform to 5.0 of [Requirement 6207](#) using [TABLE 6207B - I](#) as part of the verification (see [5.1](#)).

REQUIREMENT 6207

APPENDIX B

TABLE 6207B - I. MQJ configurations- Continued.

- 1/ Applications to select only a MQJ with PC polish: OTDR measurement, especially one using a high resolution module.
- 2/ Applications to select an overfilled launch MQJ: OTDR measurement, especially one using a high resolution module.
- 3/ Applications to select a restricted launch MQJ: None for an OTDR measurement application.
- 4/ Polish type shall conform to APC,E = domed end face with an enhanced APC polish; PC, E = domed ferrule with an enhanced PC polish; PC,S = domed ferrule with a standard PC polish, or NC,S = flat ferrule with a standard NC polish. Ferrule end face shall meet end face geometry for the specified polish type (see [4.6.2](#)). Method used shall conform to [4.6.1](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6208

MECHANICAL SPLICE ASSEMBLY EQUIPMENT

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) used to secure the fiber optic mechanical splice within a section of cable or attach a fiber pigtail onto the end of fiber optic cabling. Included is equipment for cutting and strapping, cleaving, cable alignment and crimping, curing and heat shrinking for mechanical splice assembly. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental assembly. This requirement defines the tools and accessories that comprise the set (kit) for assembling (securing) a fiber optic mechanical splice within a fiber optic cable or for attaching a fiber pigtail onto the end of fiber optic cabling. When the mechanical splice assembly equipment (including cleaving, curing and crimping) are used properly and the procedure tailored correctly for the specific mechanical splice in accordance with the specified generic assembly procedure, optical loss and return loss (single mode only) values, as specified in the component specifications, will be obtained. Also, this equipment is to be used with cleaning consumable supplies listed in [Requirement 6201](#). The recommended mechanical splice assembly equipment supports the following tasks:

- a. Cut and strip fiber optic cable, aramid yarn and optic fiber buffer/coating. This operation requires the use of cable and aramid yarn cutting and buffer stripping tools.
- b. Cleave the fiber end face to obtain the required optical loss and return loss. This operation requires the use of the tip shaper (end face polisher) or cleaving the fiber ends to the specified angle/geometry.
- c. Crimp aramid yarn (such as Kevlar) of fiber optic cable onto the mechanical splice. This operation requires the use of crimp tools and dies.
- d. Cure UV adhesive to secure the optic fibers within the capillary with a specified cure cycle. This operation requires the use of specified curing oven and fiber holding fixtures.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling.

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6208

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Assembly, mechanical splice. The act used to secure a fiber optic mechanical splice within a section of a fiber optic cable or to attach a fiber pigtail to the end of fiber optic cabling.

3.2 Pigtail, fiber. A length of fiber optic cable usually 304.8 mm to 457.2 mm (12 inches to 18 inches) terminated on one end with a fiber optic terminus or single ferrule connector.

4. Requirements. Fiber optic mechanical splice assembly equipment shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the support equipment to those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic mechanical splice assembly equipment used shall be restricted to those in [TABLE 6208 – I](#) and [TABLE 6208 – II](#). This fiber optic mechanical splice assembly equipment is used for securing mechanical splices within cable that are a part of a fiber optic cable harness.

6208GD	Splice Component Pack (Purple)	10	7JE02	FORS-100M11100

6. Notes.

6.1 Intended use. On these platforms, the fiber optic splice assembly equipment is intended to be used for securing mechanical splices within a section of cable or attach a fiber pigtail onto the ends of fiber optic cabling that are a part of (1) cable harnesses and (2) other miscellaneous cabling.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6209

POST INSTALLATION INSPECTION TOOLS

1. Purpose. This requirement refines or bounds (constrains) the selection of the fiber optic support equipment (SE) consisting of the tools that can assist in the post installation inspection of fiber optic cable harnesses. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4 T.O. 1-1A-14-4/TM1-1500-232-24-4](#)- Installation and Testing Practices, Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three difference processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definition.

3.1 Post installation inspection. An examination performed after the installation is completed to ensure the fiber optic cable harness is in place and secured using proper methods and processes.

4. Requirements. Fiber optic support equipment (SE) shall include tools needed to perform a post installation inspection. Tools used shall include those cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and to those cited in this Standard Practice.

5. Implementation. Unless otherwise specified by the applicable Platform Office, tools used to perform a post installation inspection of the cable optic cable harness shall include those in [TABLE 6209 – I](#).

^{1/} Part numbers listed are for manufacturers' products that have been identified to meet the full requirements for the item. Other manufacturers are welcome to produce equivalent products for outfitting the set.

Applicability to be determined through the applicable supply process.

^{2/} These tools and accessories are considered general equipment. Other tools and accessories suitable to perform the inspection can be used.

^{3/} Alternatives for each item are listed below the first listing for this piece of support equipment to allow for personal preference for different sizes and types.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic tools used for post installation inspection of (1) cable harnesses and (2) other miscellaneous fiber optic installed cabling.

MIL-STD-1678-6A
w/CHANGE 1

INTERFACE REQUIREMENTS FOR PARTS AND SUPPORT EQUIPMENT
(6301-6307)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

TERMINI RETENSION CLIP SEATING TESTER INTERFACE REQUIREMENTS

1. Purpose. The interface requirements for a fiber optic termini retention clip seating tester are specified herein. These requirements minimize variables in testing by standardizing areas of plunger interface with the terminus and applied loading. Minimizing test variables permits more accurate comparison of test results from multiple sources of supply for this tester. The intent is to provide a tester that gives the Fleet/Field maintainer with a means to inspect for and verify that a terminus is seated properly within the connector insert. Different seating configurations exist, dependent upon terminus type. The terminus that does not contain a retention clip is checked to ensure proper seating of the terminus within the retention clip of the connector insert. This configuration is found for termini used with the MIL-DTL-38999 Series III connector. The terminus containing a retention clip is checked to ensure proper seating of the retention clip within the connector insert. This configuration is found for termini used with the MIL-PRF-28876 and MIL-PRF-64266 connectors. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, electrical contact. A tester is used to verify that an electrical contact is seated within the retention clip (contact retainer clip) of a MIL-DTL-38999 connector. If a "click" is heard, then it is assumed that the contact (or fiber optic terminus) is "locked into place". This may not be the case. Each cavity in a MIL-DTL-38999 connector insert has a retention clip. Each retention clip has at least two fingers. If a contact (or fiber optic terminus) is not inserted completely, the fingers may not lock onto the contact (terminus) shoulder (i.e., the smaller diameter below the shoulder). The fingers of the retention clip remains sitting on top of the shoulder (i.e. the larger diameter of the contact shoulder). When mated, the action of the two contacts first abutting can push back on the unlocked contact.

1.2 Supplemental, fiber optic termini. A similar tester is needed for verifying proper retention clip seating of a fiber optic terminus. Concerns with not shattering the optical fiber end and the appropriate applied load need to be addressed prior to the tester design. Requirement 6301 provides those requirements in the form of a requirements list.

1.3 Supplemental, item number. Item number assigned to the termini retention clip seating tester is 6203GA (see [Requirement 6203](#)). For Navy Shipboard applications, approved tools for the termini retention clip seating tester are found in the Navy Shipboard Fiber Optic Recommended Tool List also.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Retention clip seating tester. A tool used as a means to inspect for and verify that a fiber optic terminus is seated properly within the insert of a multiple termini connector.

3.2 Termini. A component used in a fiber optic, multiple termini, connection that is inserted into one of the insert cavity of a multiple termini connector and terminated onto the end of a simplex, fiber optic cable. Termini is the plural form for the word terminus.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

3.3 Terminus. Singular form for the word termini.

3.4 Terminus, pin. The male configuration of a terminus that consists of a metal barrel (body) and a metal or ceramic ferrule.

3.5 Terminus, socket. The female configuration of a terminus that consists of a metal barrel (body), a metal or ceramic ferrule and an alignment sleeve. The alignment sleeve attaches to the socket terminus ferrule. Fiber alignment occurs when the pin terminus slides into the alignment sleeve of the socket terminus.

4. Requirements. Fiber optic retention clip seating tester shall be standardized for commonality compliance across platforms. Commonality compliance is that which bounds or restricts the interface requirements and operation to those cited in this Standard Practice. Requirements for the termini retention clip seating tester interface with the termini shall comply with 4.1 through 4.3. Considerations for determining these fiber optic related requirements are addressed in [appendix A](#).

4.1 Plunger end face requirements.

4.1.1 Dimensional requirements. Plunger for socket termini and plunger with alignment sleeve affixed for pin termini shall meet the dimensions in the table specified for each terminus type in [figure 6301 - 1](#). Plunger contact with the optical fiber at the ferrule end face shall result in no defects or scratches to the optical fiber or ferrule.

1/ Dimension G = Dimension F + .010.

2/ .010 R Min.

3/ Alignment sleeve portion shall have a .140 maximum outside diameter.

4/ All dimensions are in inches.

5/ Break all sharp edges.

6/ Alignment sleeve and plunger may be one piece or separate pieces. If the latter, the alignment sleeve shall be permanently affixed to the plunger.

7/ /18 w/ASR = M29504/18 with an alignment sleeve retainer installed.

8/ Color shall be in accordance with 4.1.2.

9/ M29504/18 includes the M29504/20 also.

FIGURE 6301 - 1. Plunger and alignment sleeve dimensions – Continued.

4.1.2 Color code. The various type termini plungers shall be color coded as follows:

- a. M29504/4 and M29504/5. Violet.
- b. M29504/14 and M29504/15. Yellow.
- c. M29504/18. Black.

4.2 Materials.

4.2.1 Plunger.

4.2.1.1 Hardness. Plunger tip hardness shall be as applicable for the materials listed in 4.2.1.1 a through d.

- a. Hardened to Rockwell 53-57 Condition C for M2 steel plated for corrosion resistance.
- b. Heat treated to Rockwell C38-42 for types 410 and 420 CRES,
- c. Heat treated to Rockwell C35-40 for type 416 CRES.
- d. Hardened to Rockwell 92+ A for tungsten carbide
- e. Heat treated/temper to T3 for 2000 series aluminum with anodized finish for corrosion resistance.

4.2.2 Tester. Material used for the tester shall be corrosion resistant. If provided material is stainless steel, 300 series stainless steel is acceptable.

4.2.3 Alignment sleeve. Stainless steel.

4.3 Applied load requirement.

4.3.1 Applied force.

- a. Tester shall allow a specified force (load) of 1.81 ± 0.45 kg (4 ± 1 pound) to be applied.
- b. Tester shall contain a visual indication when the specified force (see 4.3.1) has been obtained (reached). Visual indication of when at the specified force shall be detectable and easily noticed.
- c. Tester shall contain a means to calibrate (align and set) the tester visual indicator, and any other indications (such as sound), at the specified force. Calibration is to be performed by a calibration laboratory, not the operator (using the tester).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

4.3.2 Alignment. This alignment refers to the longitudinal axis of the tester plunger being in line with the longitudinal axis of the terminus.

- a. Axial alignment. Tester shall contain a means to prevent a side (off-axial) force from being applied to the terminus. This means of prevention shall work for multiple shell sizes (11 through 25 at a minimum).
- b. Visibility. Tester means of axial alignment shall be in a manner so as to minimize any restriction on visibility to the terminus.

4.4 Markings. Tester shall be marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code. Markings shall be of minimum readable height (able to read/distinguish characters), and of sufficient legibility (each character can be easily identified, even if some of the print is faded or removed) and permanency (if markings remain legible after completion of qualification test sequence).

4.5 Envelop dimensions. When specified, the tester with the plunger for each specified terminus shall be placed into a plastic case. The case dimensions shall not exceed 7.25 inch long by 3.5 inch wide by 1.13 inch deep.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic retention clip seating tester shall incorporate the interface dimensions in [figure 6301 - 1](#) and the interface requirements of [4.1](#) through [4.3](#). Verification of these requirements shall comply with 5.1 and 5.2.

5.1 Responsibility. Unless otherwise specified by the acquiring activity, the supplier is responsible for the performance of all items contained herein with regard to the above requirements.

5.2 Performance verification. Dimensional data for the plunger end face and calibration data for the applied load may be provided to demonstrate performance; however, the acquiring activity reserves the right to perform any of the inspections specified. When specified, test samples shall be submitted to the designated Approving Activity (see appendix B) for approval.

5.2.1 Evaluation criteria. When the tester is evaluated by the Approving Activity, then the evaluation criteria used shall include the criteria as found in [appendix B](#).

5.2.2 Evaluation sheets. When the tester is evaluated by the Approving Activity, then the evaluation sheets used shall include the content as on the evaluation sheets in [appendix C](#).

6. Notes.

6.1 Intended use. On these platforms, the fiber optic termini retention clip seating tester intended use includes (1) cable harnesses, (2) equipment (electronic module/package) such as a ATR, LRC, LRM, LRU or WRA with internal fiber optics, (3) circuit card modules and assemblies with internal fiber optics, (4) fiber optic test jumpers, and (5) other miscellaneous cabling.

6.2 Consideration for requirements. Considerations for specifying the parameters and limits are addressed in [appendix A](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

APPENDIX A

CONSIDERATIONS FOR DETERMINING FIBER OPTIC RELATED REQUIREMENTS

A.1 Intent. Verify that the terminus is fully seated in the connector insert cavity by applying a force on the terminus endface.

A.2. Applicable documents.

A.2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-PRF-29504/14	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Pin Terminus, Front Release, Ceramic Ferrule, (for MIL-C-28876 Connectors.)
MIL-PRF-29504/15	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Socket Terminus, Front Release, Ceramic Ferrule (for MIL-C-28876 Connectors.)
MIL-DTL-38999	-	Connectors, Electrical, Circular, Miniature, High Density, Quick Disconnect, (Bayonet Threaded and Breech Coupling), General Specification for.

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

A.2.3 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

ELECTRONIC COMPONENTS ASSOCIATION (ECA)

EIA-364	-	Electrical Connector/ Socket Test Procedures Including Environmental Classifications.
-------------------------	---	---

(Copies are available online at <http://www.eciaonline.org> or from Electronic Components Association, 2214 Rock Hill Rd, Suite 170, Herndon, VA 20170.)

A.2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

APPENDIX A

A.3 Considerations for applied force.

A.3.1 Maximum factors.

- a. Force for retention clip. MIL-DTL-38999 specifies a retention force of 9.98 kilograms (22 pounds).
- b. Only one locked finger. The retention clip in a MIL-DTL-38999 connector insert has at least two fingers. If a contact (or fiber optic terminus) is inserted at an angle, only one finger may come down and lock onto the contact (terminus) shoulder (i.e., the smaller diameter below the shoulder). The other finger(s) of the retention clip remains sitting on top of the shoulder (i.e. the larger diameter of the terminus shoulder). When mated, the action of the two termini contacting will place an additional applied load on the one locked finger. MIL-DTL-38999 specifies a retention force of 9.98 kilograms (22 pounds) with both fingers of the retention clip engaged. If only one finger is engaged, the force will be applied only to that one finger. The maximum value for the force applied must be below the force that may cause the breakage to the one engaged finger.
- c. Terminus spring force. The maximum value for the force applied must be below the force that may cause damage to the terminus compression spring.

A.3.2 Minimum factors.

- a. Frictional forces. Frictional forces may cause an unlocked terminus to be retained in place. Fingers on retention clip may rest on large diameter of shoulder. Retention sealing and obstructions can increase friction. Force applied must overcome the seals and any obstructions.

A.3.3 Selection criteria.

- a. Upper limit. The upper limit is taken as the maximum force that can be applied and not damage the compression spring. The M29504/14 and M29504/15 termini have the lowest value for this upper limit due to the non-resiliency of the spring type used. A very conservative limit of 2.27 kilograms (5 pounds) is used so as not to discuss any proprietary information.
- b. Lower limit. The lower limit is taken as applying a sufficient force to move a non fully seated terminus back into the connector insert cavity. For a M29504/14 and M29504/15 termini, each terminus is placed in the insert at a position just before the fingers on the retention clip engage the 45 degree chamfer (such as fingers sitting on the 2.64 mm (.104 inch) diameter). Applied loads of 0.45 kg, .91 kg and 1.36 kg (1, 2, and 3 pounds) were placed on the terminus. In multiple tests, it was found that a minimum force of 1.36 kg (3 pounds) is required to push the terminus through (out of) the insert. Results for the M29504/18 are similar. For a M29504/4 terminus, the test result show that the force required to move a non-fully seated terminus is less than 0.23 kg (0.5 pound). The M29504/4 pin terminus offers more conservative configuration over the M29504/5 socket terminus since additional friction must be overcome at the connector interface seal. The M29504/4 pin terminus was configured with heat shrink over jacketed cable to offer a more conservative configuration (additional friction to overcome) at the rear grommet.

A.4 Conditions for endface configuration.

A.4.1 No fiber contact.

A.4.2 Historical basis of endface configuration (no contact with fiber). The removal of a MIL-PRF-29504/14 and MIL-PRF-29504/15 terminus is done by applying a force on the terminus endface. First, the tip of the removal tool guide depresses the terminus retention clip. Next, the plunger applies a force on the terminus end face and pushes the terminus to be removed from the rear of the connector insert. The removal tool includes design criteria to ensure that no contact with the optical fiber will occur. Similar tools have been used successfully by the maintainer for over 25 years.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

APPENDIX A

A.5 Considerations for duration.

A.5.1 Historical basis. Military standard predecessor to EIA-364 specifies the duration of 5 to 10 seconds for the contact retention test. Several tests for verifying if electrical contacts are fully seated in the retention clips adopt a variation of this duration.

A.5.2 Determination. The applied force specified in this drawing ensures that any non-fully seated termini are pushed back prior to obtaining this force. There is no advantage to maintain the specified applied force because only fully seated termini will be subjected to the specified applied force once it is obtained.

A.6 User constraints.

A.6.1 End user process. Apply the specified force with a terminus retention clip seating tester. Next, perform a visual inspection of the terminus placement. Verify that the terminus has not been pushed back relative to the other termini in the connector insert.

A.6.2 Discrepancies verified by visual inspection. This test will verify if all fingers on the retention clip are engaged (locked). If not locked, any sufficient force applied to the terminus end face will push the terminus back further in the connector insert. This test will not determine if the terminus was inserted at an angle and in the situation that not all of the fingers have locked. If one finger has locked and the other(s) remains on the top of the shoulder (larger diameter), then the terminus will be displaced.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

APPENDIX B

TERMINI RETENTION CLIP SEATING TESTER EVALUATION CRITERIA

B.1 Intent. Verify that the termini retention clip seating tester meets criteria specified in Requirement 6301.

B.2. APPLICABLE DOCUMENTS

B.2.1 General. The documents listed in this section are specified in sections B.3, B.4, and B.5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements documents cited in sections B.3, B.4, and B.5 of this standard practice, whether or not they are listed.

B.2.2 Government documents.

B.2.2.1 Specifications, standards and handbooks. The following specifications, standards and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-29504](#) - Termini, Fiber Optic Connector, Removable, General Specification for.
- [MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environmental Resisting, General Specification for.

DEPARTMENT OF DEFENSE STANDARD

- [MIL-STD-2042](#) - Fiber Optic Cable Topology Installation, Standard Methods for Naval Ships
- [MIL-STD-2042-5](#) - Fiber Optic Cable Topology Installation Standard Methods for Naval Ships (Connectors and Interconnections) (Part 5 of 7 Parts)

GENERAL SERIES TECHNICAL MANUAL

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#)- Installation and Testing Practices, Aircraft
Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

Navy Recommended Fiber Optic Components Parts List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for tools) that may be applicable to the logistic support requirements for the specified test equipment. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

B.3 Definitions.

B.3.1 Approving activity. Unless otherwise specified, Naval Surface Warfare Center Dahlgren Division (NSWC DD) is the approving activity for approval to use a termini retention clip seating tester as specified in Requirement 6301.

B.3.2 Requesting party. Activity or vendor requests approval. Process begins by providing a termini retention clip seating tester (with specified certifications and samples), being evaluated, and if in compliance, being placed on the Navy Shipboard Fiber Optic Recommended Tool List and into [MIL-STD-1678-6](#). Consideration for approval is based on demonstrating compliance as specified in Requirement 6301.

B.4 Requirements.

B.4.1 Evaluation criteria. Termini retention clip seating tester shall meet the criteria in [TABLE 6301 B- I](#). The evaluation process, including the requesting party's submissions, shall be performed in accordance with the steps listed in [TABLE 6301 B- II](#).

B.4.2 Certifications.

B.4.2.1 Certifications with initial submission. Certifications shall be submitted for termini retention clip seating tester material (tester, plunger and alignment sleeve) and that the tool meets the interface dimensions of the plunger for socket termini and of the plunger with alignment sleeve for pin termini as specified in [figure 6301-1](#).

B.4.2.2 Modifications and replacements. Once evaluated and approved, the approving activity shall be notified in writing or by e-mail of any modifications or substitutions made to the termini retention clip seating tester. Details of the modification or substitution shall be provided for the approving activity's determination if any or all portions of the evaluation need to be redone. Details should include any certifications and other documentation needed to make this determination.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

APPENDIX B

B.4.3 Interfacing test components.

B.4.3.1 Applicable connector configurations. When specified by the Approving Activity, a connector plug and a connector receptacle shall be provided for each of the connector types listed in [TABLE 6301 B-III](#). Each terminus specified shall be terminated onto the ends of MIL-PRF-84045/16 to comprise the terminated cable assembly pigtails. The cable assembly pigtail shall consist of the terminus to be placed on one end of the MIL-PRF-85045/16 cable as listed in [TABLE 6301 B-III](#). Specific cable type used (i.e., either MIL-PRF-85045/16-01 or MIL-PRF-85045/16-02) shall conform to [TABLE 6301 B-III](#).

B.4.3.2 Applicable terminus types. Terminated cable assembly pigtails along with the termini used (in [TABLE 6301 B-III](#)) may be tailored by the approving activity depending upon the terminus types to be covered under the plunger tips, alignment sleeves, or both for the termini retention clip seating tester submitted for approval.

B.4.3.3 Termination. Termination of the termini onto the cable assembly pigtails shall be performed in accordance with [MIL-STD-2042](#). When specified, these terminations, including polishing, shall be in accordance with [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

APPENDIX B

TABLE 6301 B-I Evaluation table for termini retention clip seating tester initial inspections.

Parameter	Pass Criteria	Requirement
Dimension	Initial: Tester meets the interface dimensions of the plunger for socket termini and of the plunger with alignment sleeve for pin termini specified in figure 6301-1 . 1/	4.1.1
Color code.	Initial: Termini plugers are color coded as follows: M29504/4 and /5: Violet M29504/14 and /15: Yellow M29504/18 and /20: Black	4.1.2
Materials	Initial 1/ Plunger: One of the following in a through d. a. Hardened to Rockwell 53-57 Condition C for M2 steel plated for corrosion resistance, b. Heat treated to Rockwell C38-42 for types 410 and 420 CRES, c. Heat treated to Rockwell C35-40 for type 416 CRES. d. Hardened to Rockwell 92+ A for tungsten carbide. e. Heat treated/temper to T3 for 2000 series aluminum with anodized finish for corrosion resistance. Alignment sleeve: CRES Tester: Material used for the tester shall be corrosion resistant. If provided material is stainless steel, 300 series stainless steel is acceptable d. Hardened to Rockwell 92+ A for tungsten carbide	4.2
Applied force.	Initial: a. Terminus retention clip seating tester shall be accurate to (provide a visual indication at) 1.81 ± 0.45 kg (4 ± 1 pound). b. Visual indication detectable and easily noticed when 4 lb force applied. c. Align and set. Verified that visual indicator can be aligned and set at the specified applied force of 1.81 ± 0.45 kg (4 ± 1 pound).	4.3.1
Alignment to prevent off-axial force	Initial: Observe there is a means present to prevent side (off-axis) force being applied with minimizing restriction on terminus vis bility.	4.3.2
Markings	Initial: Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code Visual and mechanical inspection: easily identifiable, legibility and permanency	4.4
Envelop dimensions	Initial: When specified, tester with the plunger for each specified terminus shall be placed into a plastic case. The case dimensions shall not exceed 7.25 inch long by 3.5 inch wide by 1.13 inch deep.	4.5
Visual end face inspection	Pre-testing and measurement: MIL-STD-1678-3 Measurement 3101 with note 4/ of TABLE 6301 B-II . Digital image of each ferrule end face shall be stored for later comparision with the post testing and measurements visual end face inspection.	B.5.1.2

See footnote at end of table.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

APPENDIX B

TABLE 6301 B-I Evaluation table for termini retention clip seating tester initial inspections – continued.

Parameter	Pass Criteria	Requirement
Correct visual indication at 4 pound load	Testing and measurement: Apply an increasing load with a device capable of measuring a precise load (i.e., accurate to +/- 0.1 lb). Visual indication is observed when a load of 1.81 ± 0.45 kg (4 ± 1 pound) is reached. Evaluation sheet similar to TABLE 6301 C-II shall be used.	B.5.1.3.a
Retention clip seating test	Testing and measurement: Insert a terminus (cable assembly pigtail) into the specified connector and shell sizes in TABLE 6301 B-III . Perform a retention clip seating test in accordance with NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4 Work Package 007 01 or as specified by the approving activity. The retention clip retention test shall be redone for each of the termini in TABLE 6301 B-III (as part of the cable assembly submission) for each connector shell size. Terminus retention clip seating tester shall be accurate to (provide a visual indication at) 1.81 ± 0.45 kg (4 ± 1 pound). The visual indicator shall be observed when placed in the connector. The means to prevent a side or off-axial load shall be successful when an attempt to apply one is performed. The termini retention clip seating tester shall release to or be able to reset to zero (i.e., no visual indicator observed) after each test.	B.5.1.3.b
Visual end face inspection	Post testing and measurement: Performed using a fiber optic video inspection system that complies with MIL-STD-1678-5 Requirement 5202. Digital image of each ferrule end face shall be obtained and compared with the pre-testing and measurements visual end face inspection. Pass: No additional defects or scratches shall be observed on the ferrule end face as a result of performing a retention clip seating test on each terminus.	B.5.2
Visual and mechanical inspection	Post testing and measurement. Complete inspection in TABLE 6301 C-IV .	B.5.3

1/ Certifications required: Interface dimensions conformance of plunger and alignment sleeve. Dimensional checks may be performed at the discretion of the Approving Activity. Plunger conforms to the material and hardness. Alignment sleeve conforms to the specified material.

	M29504/4 & /5	MIL-PRF-29504/5	X	--	<u>11/</u>	<u>11/</u>
2.0 mm PC polish	M29504/14 & /15	MIL-PRF-29504/14 <u>8/</u>	X	--	<u>12/</u>	<u>12/</u>
	M29504/14 & /15	MIL-PRF-29504/14 <u>9/</u>	X	--	<u>12/</u>	<u>12/</u>
	M29504/14 & /15	MIL-PRF-29504/15 <u>8/</u>	X	--	<u>12/</u>	<u>12/</u>
	M29504/14 & /15	MIL-PRF-29504/15 <u>9/</u>	X	--	<u>12/</u>	<u>12/</u>

1/ Cable assembly pigtail minimum length is 12 inches (.3 meters) from ferrule tip (end face) to end of the pigtail.

2/ MM = Multimode, SM = Single Mode, X = one cable assembly pigtail with specified terminus type.

3/ Standard PC polish is the standard procedure for the domed end face polish in [MIL-STD-2042](#).

4/ APC polish is the angled end face polish in [MIL-STD-2042](#).

5/ Cable assembly pigtail shall be constructed with MIL-PRF-85045/16-01 multimode cable.

6/ Cable assembly pigtail shall be constructed with MIL-PRF-85045/16-02 single mode cable.

7/ Cable assembly pigtail shall be terminated with APC polished terminus.

8/ Delphi or other QPL source with a narrow pedestal ferrule end face.

9/ AFSI or other QPL source with a broad pedestal ferrule end face.

10/ Provide a total of one MIL-PRF-64266 connector plug and one connector receptacle for shell sizes 11 and 23 (not one for each row).

11/ Provide a total of one MIL-DTL-38999 connector plug and one MIL-DTL-38999 connector receptacle for shell sizes 11 and 25 (not one for each row).

12/ Provide a total of one MIL-PRF-28876 connector plug and one MIL-PRF-28876 connector receptacle for shell sizes 13 and 23 (not one for each row).

B.5. Verification. Verification shall consist of the evaluation performed by the requesting party and by the approving activity as listed in [TABLE 6301 B-I](#) using the step specified in [TABLE 6301 B-II](#) and as further detailed in B.5.1 through B.5.4.

B.5.1 Evaluators. The evaluation shall include the inspections and measurements in B.5.1.1 through B.5.1.4.

B.5.1.1 Termini retention clip seating tester initial inspections. During the termini retention clip seating tester initial inspections, the evaluator shall rate termini retention clip seating tester performance as listed in B.5.1.1.a through e.

- Dimension.
- Color code.
- Materials.
- Applied force.
- Alignment to prevent off-axial force.
- Markings.
- Envelope dimensions.

APPENDIX B

B.5.1.2 Pre-testing and measurements visual end face inspection. Visual end face inspection shall be performed in accordance with [MIL-STD-1678-3](#) Measurement 3101 with note 4/ of [TABLE 6301 B-II](#). Digital image of each ferrule end face shall be stored for later comparison with the post testing and measurements visual end face inspection.

B.5.1.3 Testing and measurements. The tests for Correct visual indication at 4 pound load and Retention clip seating shall be performed with the test sample (cable assembly pigtails) as specified in [TABLE 6301 B-III](#).

- a. Correct visual indication at 4 pound load. Apply an increasing load with a device capable of measuring a precise load (i.e., accurate to +/- 0.1 lb). Determine if the visual indication is observed when a load of 4 pounds is obtained. Perform this measurement 10 times. This may be done as part of the initial inspections on the termini retention clip seating at the discretion of the Approving Activity.
- b. Retention clip seating test. Insert a terminus (cable assembly pigtail) into the specified connector and shell sizes in [TABLE 6301 B-III](#). Perform a retention clip seating test in accordance with [NAVAIR 01-1A-505-4/T.O. 1-1A-14-4/TM 1-1500-232-24-4](#) Work Package 007 01 or as specified by the approving activity. The retention clip retention test shall be redone for each of the termini in [TABLE 6301 B-III](#) (as part of the cable assembly submission) for each connector shell size. The visual indicator shall be observed when placed in the connector. The means to prevent a side or off-axial load shall be successful when an attempt to apply one is performed. The termini retention clip seating tester shall release to or be able to reset to zero (i.e., no visual indicator observed) after each test.

B.5.1.4 Post testing and measurements inspections. The visual end face inspection and the visual and mechanical inspection shall be performed in accordance with B.5.2 and B.5.3.

B.5.2 Visual end face inspection. Measurement shall be performed using a fiber optic video inspection system that complies with [MIL-STD-1678-5](#) Requirement 5202. Digital image of each ferrule end face shall be obtained and compared with the pre-testing and measurements visual end face inspection. No additional defects or scratches shall be observed on the ferrule end face as a result of performing a retention clip seating test on the terminus.

B.5.3 Visual and mechanical inspection. Inspections shall be performed in accordance with [MIL-STD-1678-3](#) Measurement 3101 with note 4/ of [TABLE 6301 B-II](#).

B.5.4 Evaluation package. An evaluation package shall be prepared for the termini retention clip seating tester. The evaluation package shall include the documentation listed in B.5.4.a through c.

- a. Evaluation sheets for initial and post measurement inspections. Evaluation sheets used shall include the content as on the evaluation sheets in [appendix C](#).
- b. Data sheet information as specified in 4.2 and applicable items in TABLE 2201 A-I of [MIL-STD-1678-2](#) Measurement 2201. This information may appear on a separate General Data Sheet (cover sheet) or incorporated into the evaluation sheet.
- c. Summary sheet with summary or table of inspections and measurements, the result (findings) of each, approval or recommended corrective actions, other pertinent input, signature or initials of reviewer or authority at approving activity. Summary sheet may be first page of the evaluation package.

B.6. Notes.

B.6.1 Intents behind standardization efforts.

B.6.1.1 Multiple party testing considerations. The incentive to minimize test variables, resulting in a level playing field for multiple parties testing, leads the Government to establish a baseline. This baseline includes considerations for fabrication of test samples, methods to verify actions/measurements and use of specific test practices in addition to specifics for test sample configurations.

MIL-STD-1678-6A

REQUIREMENT 6301

APPENDIX C

TERMINI RETENTION CLIP SEATING TESTER EVALUATION SHEETS

C.1 Excerpt from evaluation sheets to illustrate (1) termini retention clip seating tester initial inspections, (2) Durability testing and ferrule protrusion length measurements, and (3) Post measurements inspections. Criteria listed in the evaluation sheets is taken from [TABLE 6301 B- I](#).

a. Excerpt from an evaluation sheet to illustrate the termini retention clip seating tester initial inspections.

TABLE 6301 C-I Evaluation sheet for termini retention clip seating tester initial inspection.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
Dimension	Tester meets the interface dimensions of the plunger for socket termini and of the plunger with alignment sleeve for pin termini specified in figure 6301-1 1/		
Color code.	Termini plungers are color coded as follows: M29504/4 and /5: Violet M29504/14 and /15: Yellow M29504/18 and /20: Black		
Materials	Plunger: One of the following in a through d. 1/ a. Hardened to Rockwell 53-57 Condition C for M2 steel plated for corrosion resistance, b. Heat treated to Rockwell C38-42 for types 410 and 420 CRES, c. Heat treated to Rockwell C35-40 for type 416 CRES. d. Hardened to Rockwell 92+ A for tungsten carbide. e. Heat treated/temper to T3 for 2000 series aluminum with anodized finish for corrosion resistance. Alignment sleeve: CRES 1/ Tester: Material used for the tester shall be corrosion resistant. If provided material is stainless steel, 300 series stainless steel is acceptable		
Applied force.	a. Terminus retention clip seating tester shall be accurate to (provide a visual indication at) 1.81 ± 0.45 kg (4 \pm 1 pound). b. Visual indication detectable and easily noticed when 4 b force applied. c. Align and set. Verified that visual indicator can be aligned and set at the specified applied force of 1.81 ± 0.45 kg (4 \pm 1 pound).		
Alignment to prevent off-axial force	Observe there is a means present to prevent side (off-axis) force being applied with minimizing restriction on terminus visibility.		
Markings	Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code		
Envelop dimensions	When specified, tester with the plunger for each specified terminus shall be placed into a plastic case. The case dimensions shall not exceed 7.25 inch long by 3.5 inch wide by 1.13 inch deep.		

1/ Certifications required: Interface dimensions conformance of plunger and alignment sleeve. Dimensional checks may be performed at the discretion of the Approving Activity. Plunger conforms to the material and hardness. Alignment sleeve conforms to the specified material. Tester conforms to specified materials.

APPENDIX C

TERMINI RETENTION CLIP SEATING TESTER EVALUATION SHEETS

d. Excerpt from an evaluation sheet to illustrate retention clip seating tester visual and mechanical inspection.

TABLE 6301 C-IV Evaluation sheet for termini retention clip seating tester visual and mechanical inspection.

If a failure is recorded, provide details on the extent of the failure observed (on bottom on data sheet).

1. Identification markings and color.

a. Markings.

Criteria: All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Pass_____ All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Fail_____ All markings are not present. Specify on data sheet.

_____ Height of markings is too small to read/distinguish characters. Specify on data sheet.

_____ Markings are insufficiently legible (legible is if each character can be easily identified, even if some of the print is faded or removed). Specify on data sheet.

_____ Markings are not permanent (permanent is if markings remain legible after completion of qualification test sequence). Specify on data sheet.

2. Workmanship, visual.

a. Finish imperfections.

Criteria: No peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

Pass_____ No finish imperfections observed that is detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail_____ Observed sufficient peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

b. Surface imperfections.

Criteria: No rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations.

Pass_____ No surface imperfections observed that are detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail_____ Observed sufficient rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations. Specify on data sheet.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6301

APPENDIX C

c. Part imperfections.

Criteria: Product/parts are dimensionally uniform, free of lumps, kinks, splits, scraped or abraded surfaces, inclusions or other imperfections.

Pass_____ No part imperfections observed that are detrimental to form, fit or function or that could result in further protective material or function degradation

Fail_____ Observed product/parts are not dimensionally uniform, free of lumps, kinks, splits, scraped or abraded surfaces, inclusions or other imperfections. Specify on data sheet.

d. Mateability.

Criteria: Connectors, adapters, and other interconnecting devices (mateable items) mate and unmate easily and make proper connection.

Pass_____ No mateability or other mechanical interconnects observed that are detrimental to form, fit or function or that could result in preventing mating.

Fail_____ Connectors, adapters, and other interconnecting devices (mateable items) do not mate and unmate easily or do not make the proper connection. Specify on data sheet.

_____ Mateable items will not mate. Specify on data sheet.

_____ Mateable items were damaged during mating. Specify on data sheet.

_____ Mateable items did not make proper connection. Specify on data sheet.

e. Inner part imperfections.

Criteria: Inner parts contain no fractures, holes, discontinuities, bulges, thin spots or other imperfections.

Pass_____ No inner part imperfections observed that are detrimental to form, fit or function or that could result in further material or function degradation

Fail_____ Observed inner parts contain fractures, holes, discontinuities, bulges, thin spots or other imperfections. Specify on data sheet.

f. Functionality.

Criteria: Mechanical mechanisms function properly. Spring and latch mechanisms do not interfere with other components (cable fit into connector). Knobs, button, and threaded components operate properly.

Pass_____ No mechanical mechanism malfunction observed that are detrimental to form, fit or function or that could result in further material or function degradation.

Fail_____ Spring and latch mechanisms will interfere with other components (cable fit into connector). Specify on data sheet.

_____ Knobs, button, and threaded components do not operate properly. Specify on data sheet.

Details on failures recorded:

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

TERMINUS REMOVAL TOOL INTERFACE REQUIREMENTS
(FOR MIL-PRF-64266 CONNECTOR)

1. Purpose. The interface requirements for a fiber optic terminus removal tool are specified herein. These interface requirements are applicable to the MIL-PRF-29504/18 and MIL-PRF-29504/20 termini, the termini designed to be used with the MIL-PRF-64266 connector. The intent is to provide a terminus removal tool from multiple sources of supply that gives the Fleet/Field maintainer the ability to extract termini from within the connector insert from all qualified termini sources of supply. Different terminus removal tool configurations exist; however, the interface dimensions of the tool tip must conform to those of the terminus. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, function. The MIL-PRF-29504/18 and MIL-PRF-29504/20 terminus has two dimensions to accommodate the tool tip of a terminus removal tool. These interface dimensions are the ones cited in this requirement and are the ones that must be considered in the tip design of the terminus removal tool. The requirements for the tool tip function are cited in [4.1](#).

1.2 Supplemental, item number. Item number assigned to the MIL-PRF-29504/18 and MIL-PRF-29504/20 terminus removal tool is 6206CC (see [Requirement 6206](#)). For Navy Shipboard applications, approved terminus removal tool are found in the Navy Shipboard Fiber Optic Recommended Tool List also.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-29504/18](#) - Termini, Fiber Optic, Connector, Removable, Environment Resisting, Genderless Terminus, Rear Release, Ceramic Ferrule, 1.25 MM Ferrule, (for MIL-PRF-64266 Connectors).
- [MIL-PRF-29504/20](#) - Test terminus, Fiber Optic, Keyed, Connector, Removable, Environment Resisting, Genderless Terminus, Rear Insert/Rear Release, 1.25 mm Ceramic Ferrule, (for MIL-PRF-64266 Connectors).
- [MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for

DEPARTMENT OF DEFENSE STANDARD

- [MIL-STD-2042](#) - Fiber Optic Cable Topology Installation, Standard Methods for Naval Ships
- [MIL-STD-2042-5](#) - Fiber Optic Cable Topology Installation Standard Methods for Naval Ships (Connectors and Interconnections) (Part 5 of 7 Parts)

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Alignment sleeve. A cylindrical, split ceramic tube that provides the mechanical and optical alignment of two mating connector/terminus ferrules.

3.2 Alignment sleeve retainer. An alignment sleeve retainer is a separate and removable housing used within the connector shell to retain captive alignment sleeves. The alignment sleeve retainer is part of the MIL-PRF-64266 connector. Use of an alignment sleeve retainer allows a one, genderless (really pin) terminus to be used in both the MIL-PRF-64266 connector plug and the connector receptacle. Functional/optical alignment is provided by the alignment sleeve retainer thorough the use of guide pins and alignment sleeves. A captive "jackscrew", which is a part of the alignment sleeve retainer, retains the alignment sleeve retainer within the connector shell.

3.3 ASR. Alignment sleeve retainer.

3.4 Termini. A component used in a fiber optic, multiple termini, connection that is inserted into one of the insert cavities of a multiple termini connector, provides a means to break and rejoin an optical path, and is terminated onto the end of a simplex, fiber optic cable. The term "termini" is the plural form for the word terminus.

3.5 Terminus. Singular form for the word termini.

3.6 Terminus removal tool. A tool used as a means to extract a fiber optic terminus that is seated properly within the insert of a multiple termini connector.

4. Requirements. The tip of the fiber optic terminus removal tool shall be standardized for commonality compliance across platforms to ensure the ability to extract MIL-PRF-29504/18 and MIL-PRF-29504/20 termini from the insert of a MIL-PRF-64266 multiple termini connector. Commonality compliance is that in which bounds or restricts the parts to those cited in this Standard Practice. Requirements for the terminus removal tool interface with the termini shall comply with 4.1 through 4.4.

4.1 Function. The function of the terminus removal tool tip shall be to fit around the cylindrical surface of the terminus retention clip and, with an applied upward (i.e., towards the rear of the terminus) load (force), press against the surface of the rear "lip" on the retention clip for terminus extraction. No damage to the terminus removal tool, terminus or fiber optic cable shall result from a terminus extraction (removal).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

FIGURE 6302 - 1 Tool tip interface with retention clip.4.2 Dimensional requirements.

4.2.1 Retention clip exposure length. The dimension for the tool tip that interfaces with the exposed length of the retention clip shall be designed to accommodate the dimensions specified in MIL-PRF-29504/18 and /20 (see figure 6302-1).

4.2.2 Gap length. The dimension for the tool tip that interfaces with the exposed length of the retention clip shall be designed to accommodate the maximum gap length in MIL-PRF-29504/18 and MIL-PRF-29504/20 (see figure 6302-1). This gap length is the one between the back of the retention clip and the front (leftmost surface) of the rear shoulder. This gap length is the resultant exposed length (or gap) when the retention clip is in the most forward position in an unmated condition.

4.2.3 Envelope dimensions. These envelope dimensions specify the maximum dimensions of the tool and shall be no greater than those dimensions specified in figure 6302-2. The envelope dimensions shall be used to determine the geometry for material to be removed from the tool kit case to create a cut out or pocket for the terminus removal tool.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

FIGURE 6302 - 2 Tool envelope dimensions.

4.3 Materials. Terminus removal tool material shall meet the durability, corrosion and applied load requirements of 4.3.1 through 4.3.3.

4.3.1 Durability. Material used for the tool tip shall be durable to survive 1000 extractions (termini removals) without showing any signs of wear and degradation in function.

4.3.2 Corrosion. Material used for the tool tip shall be corrosion resistant. If provided with a stainless steel tool tip, types of stainless steel listed in 4.3 are acceptable, otherwise the steel listed in 4.3.3.a is acceptable. A 300 series or a 400 series stainless steel is acceptable for the tool body (remainder of tool except for tool tip).

4.3.3 Hardness. Tool tip (probe) hardness shall be as applicable for the materials listed in 4.3.3a through c.

- a. Hardened to Rockwell 53-57 Condition C for M2 steel plated for corrosion resistance.
- b. Heat treated to Rockwell C38-42 for types 410 and 420 CRES.
- c. Heat treated to Rockwell C35-40 for type 416 CRES.

4.4 Markings. Terminus removal tool shall be marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code. Markings shall be of minimum readable height (able to read/distinguish characters), and of sufficient legibility (each character can be easily identified, even if some of the print is faded or removed) and permanency (if markings remain legible after completion of qualification test sequence).

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic terminus removal tool shall incorporate the interface dimensions in figure 6302 - 1 and the interface requirements of 4.1 through 4.4. Verification of these requirements shall comply with 5.1 through 5.4.

5.1 Responsibility. Unless otherwise specified by the procuring activity, the supplier is responsible for the performance of all items contained herein with regard to the above requirements.

5.2 Performance verification. Dimensional data for the tool tip and load test data for the applied load may be provided to demonstrate performance; however, the Procuring Activity reserves the right to perform any of the inspections specified. When specified, test samples shall be submitted to the designated Approving Activity (see appendix A) for approval.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

5.2.1 Evaluation criteria. When the terminus removal tool is evaluated by the Approving Activity, the evaluation criteria used shall include the criteria as found in [appendix A](#).

5.2.2 Evaluation sheets. When the terminus removal tool is evaluated by the Approving Activity, the evaluation sheets used shall include the content as on the evaluation sheets in [appendix B](#).

5.3 Performance demonstration with fully populated connectors. When specified, test data submitted shall include verification for demonstration of successful terminus extraction from each insert cavity position in each shell size connector. As an alternative, selected insert cavity positions may be specified instead.

5.4 Restrictions. Terminus extraction from the insert cavity shall be performed on unmated connector plugs and unmated connector receptacles with the alignment sleeve retainer (ASR) removed.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic terminus removal tool are used to extract termini from a MIL-PRF-64266 multiple termini connector, are a part of (1) cable harnesses, and (2) equipment (electronic module/package) such as a ATR, LRC, LRM, LRU or WRA with internal fiber optics.

6.2 Retention clip exposure length. Interface length of the tool tip (i.e., the length that interfaces with the exposed length of the retention clip) should be designed to accommodate (or be sufficiently shorter than) the MIL-PRF-29504/18 and MIL-PRF-29504/20 specified minimum length between the rear "lip" of the retention clip and the rear of the connector insert. This dimension (specified as .050 minimum) is the resultant length when the retention clip is in the most forward position in a connector insert that is unmated (not a part of a mated pair).

6.3 Gap length. Interface length of the tool tip (i.e., the length that interfaces with the exposed length of the retention clip) should be designed to prevent egress into the gap behind the retention clip. Specifically, this gap (specified as .030 maximum) is between the back of the retention clip and the front (leftmost surface) of the rear shoulder. This gap is measured when the retention clip is in the most forward position in a connector insert that is unmated (not a part of a mated pair). The tool tip should be sufficiently longer than the maximum allowed dimension for the gap.

6.4 Damage prevention to cabling. The practice to "break edges" should be implemented to reduce the potential of the tool tip grabbing, nicking or scrapping the cable jacket when the tool tip is brought into contact with the cable jacket. Also, this is a recommended safety measure to prevent potential injury to personnel handling the terminus removal tool.

MIL-STD-1678-6A

An automated reply will contain the current web address.)

A.3 Definitions.

A.3.1 Approving activity. Unless otherwise specified, Naval Surface Warfare Center Dahlgren Division (NSWC DD) is the approving activity for approval to use a terminus removal tool as specified in Requirement 6302.

A.3.2 Requesting party. Activity or vendor requests approval. Process begins by providing a terminus removal tool (with specified certifications), being evaluated, and if in compliance, being placed on the Navy Shipboard Fiber Optic Recommended Tool List and into [MIL-STD-1678-6](#). Consideration for approval is based on demonstrating compliance as specified in Requirement 6302.

A.4 Requirements.

A.4.1 Evaluation criteria. Terminus removal tool shall meet the criteria in [TABLE 6302 A- I](#). The evaluation process, including the requesting party's submissions, shall be performed in accordance with the steps listed in [TABLE 6302 A- II](#).

A.4.2 Certifications.

A.4.2.1 Certifications with initial submission. Certifications shall be submitted for terminus removal tool material (to verify durability and corrosion), to certify compliance to the tool tip interface with a terminus retention clip as shown in [figure 6302 - I](#), and to certify compliance to the envelope dimensions as shown in [figure 6302 - II](#).

A.4.2.2 Modifications and replacements. Once evaluated and approved, the approving activity shall be notified in writing or by e-mail of any modifications or substitutions made to the terminus removal tool. Details of the modification or substitution shall be provided for the approving activity's determination if any or all portions of the evaluation need to be redone. Details should include any certifications and other documentation needed to make this determination.

A.4.3 Terminated cable assemblies

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

APPENDIX A

A.4.3.1 Termini cable assembly pigtails. Termini cable assembly pigtails shall be included as part of the submission. Specific termini cable assembly pigtails shall conform to [TABLE 6302 A-III](#)

A.4.3.2 Applicable terminus types. Termini cable assembly pigtails (in [TABLE 6302 A-III](#)) may be tailored by the approving activity depending upon the variants of the terminus removal tool submitted for approval.

A.4.3.3 Termination. Termini termination onto the terminus cable assembly pigtail shall be performed in accordance with [MIL-STD-2042](#). When specified, these terminations shall be in accordance with [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#). Termination shall be performed so that the single fiber cable is affixed and crimped to the terminus. Epoxy and end face polishing is optional.

TABLE 6302 A-I Evaluation table for terminus removal tool.

Parameter	Pass Criteria	Requirement
Function (terminus extraction process)	Initial: Terminus shall be extracted successfully when the following procedure is performed: Terminus removal tool tip shall be fitted around the cylindrical surface of the terminus retention clip. Apply an upward load (force) (i.e., towards the rear of the terminus), pressing against the surface of the rear "lip" on the retention clip. Extract the terminus. Post 100 removal cycles: Terminus removal tool tip shall perform 100 terminus extractions with no binding or loosening (terminus wobbling).	4.1
Length, retention clip exposure.	Initial: Dimension for the tool tip that interfaces with the exposed length of the retention clip shall be designed to accommodate the dimensions specified in MIL-PRF-29504/18 and /20 (see figure 6302-1). Significantly shorter than maximum length of 0.050 inches (see 6.2).	4.2.1
Length, gap.	Initial: Dimension for the tool tip that interfaces with the exposed length of the retention clip shall be designed to accommodate the maximum gap length in MIL-PRF-29504/18 and MIL-PRF-29504/20 (see figure 6302-1). This gap length is the one between the back of the retention clip and the front (leftmost surface) of the rear shoulder. This gap length is the resultant exposed length (or gap) when the retention clip is in the most forward position in an unmated condition. Significantly longer than minimum length of 0.030 inches (see 6.3)	4.2.2
Envelope dimensions	Initial: Tool envelope dimensions are no greater than those dimensions specified in figure 6302-2 .	4.2.3
Cable jacket damage prevention.	Initial: No sharp edges on tool tip (see figure 6302-1). Post 100 removal cycles: No tool tip grabbing, nicking, scrapping or tearing of the cable jacket observed.	4.1
Durability	Pass: Metal that is sufficiently durable to survive 1000 extractions (termini removals). Sufficiently durable: Initial - If acceptable material used (4.3.3 materials; M2 steel plated for corrosion resistance or 410, 416, 420 CRES; are acceptable for tool tip) and withstands applied load with no evidence of breakage, cracking, chipping or other damage that would impair tool terminus removal function. <u>1/</u> Post 100 removal cycles - Without showing any signs of wear and degradation in function during and after completion of 100 removal cycles.	4.3.1
Corrosion	Initial: Material is sufficiently corrosion resistant (300 or 400 series stainless steel (CRES) is acceptable for body, M2 steel plated for corrosion resistance or 410, 416, 420 CRES per 4.3.3 for tool tip). <u>2/</u>	4.3.2

See footnotes at end of table.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

APPENDIX A

TABLE 6302 A-I Evaluation table for terminus removal tool.

Parameter	Pass Criteria	Requirement
Hardness	Initial: <u>1/</u>	4.3.3
Markings	Initial: Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code Post 100 removal cycles: easily identifiable, legibility and permanency	4.4
100 removal cycles	Perform 100 terminus extractions (removals). Perform post 100 removal cycles inspections for Function, Cable jacket damage protection, Durability.	<u>3/</u>
Post-100 removal cycles visual and mechanical inspections	Workmanship: finish, surface, and part imperfections; matability with terminus Markings: easily identifiable, legibility and permanency	MIL-STD-1678-3 Measurements 3103, 3104

1/ Certifications required: material to verify durability, corrosion and hardness.

2/ Certification provided that the terminus removal tool meets the [MIL-STD-1678-3](#) Measurement 3401 requirement for a 48 hour salt spray test (equivalent to [MIL-STD-202-101](#)). Certification shall include that testing was performed on terminus removal tool under evaluation or a tool/component with the same material(s).

3/ One hundred (100) removal cycles of terminus extractions shall be performed using the ten terminated cable assembly pigtailed specified in [TABLE 6302-III](#). The ten terminated cable assembly pigtailed shall be placed in the insert rear face upper right quadrant cavity positions (18, 2, 3, 4, 5, 19, 20, 21, 31, and 32) of one shell size 23 [MIL-PRF-64266](#) connector plug with a 36 cavity insert. Each of the ten terminated cable assembly pigtailed shall be extracted successfully. When extracting the terminus in position 3 and when extracting the terminus in position 20, the other nine terminated cable assembly pigtailed shall be installed. Adjacent termini shall not impede terminus extraction due to the geometry of the terminus removal tool. Next, these ten terminated cable assembly pigtailed shall be placed in the same insert cavity positions of the same shell size 23 [MIL-PRF-64266](#) connector plug with a 36 cavity insert and extracted an additional four times for a total of five extractions for each of the ten terminated cable assembly pigtailed. The ten terminated cable assembly pigtailed shall be placed in the insert rear face left quadrant cavity positions (6, 7, 19, 20, 21, 22, 23, 31, 32 and 33) positions of one shell size 23 [MIL-PRF-64266](#) connector receptacle with a 36 cavity insert. The same process shall be repeated for a total of five extractions for each of the ten terminated cable assembly pigtailed. When extracting the terminus in position 6 and when extracting the terminus in position 32, the other nine terminated cable assembly pigtailed shall be installed.

TABLE 6302 A-II. Actions (steps) required for terminus removal tool approval process.

Step	Action	Submits <u>1/</u>	Receives <u>1/</u>	Addendum
1	Submits request, including required certifications, terminus removal tool, ten terminus cable assembly pigtailed and one shell size 23 MIL-PRF-64266 connector (both plug and receptacle) with a 36 cavity insert	Requesting Party	Approving Activity	<u>2/</u>
2	Performs terminus removal tool initial inspections in TABLE 6302 A-I up to 100 removal cycles.	Approving Activity	See step 5	<u>3/</u>
3	Performs 100 removal cycles in accordance with note <u>3/</u> in TABLE 6302 A-I	Approving Activity	See step 5	
4	Performs post 100 removal cycle inspections:			
4a	Performs post 100 removal cycles Function, Cable jacket damage protection, Durability	Approving Activity	See step 5	<u>3/</u>
4b	Performs visual and mechanical inspection	Approving Activity	See step 5	<u>4/</u>
5	Provides results and decision on approval of terminus removal tool	Approving Activity	Requesting Party	

Notes:

1/ See A.3.1 and A.3.2.

2/ Each terminated cable assembly pigtail shall be provided with a unique identification marking.

3/ Criteria: See [TABLE 6302 A-I](#).

4/ Perform in accordance with (IAW) criteria specified in [TABLE 6302 A-I](#) supplemented by [MIL-STD-2042](#), and by [MIL-STD-1678](#) measurement 5202.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

APPENDIX A

TABLE 6302-III. Type and quantity of terminus cable assembly pigtails.

Terminus Type	Cable Type 1/ 2/	Quantity
M29504/20		10

1/ Cable assembly minimum length is 1 ft. (.30 meter) from ferrule tip (end face) to end of cable pigtail.

2/ Cable assembly pigtail shall be constructed with either [MIL-PRF-85045/16-01](#) multimode cable or [MIL-PRF-85045/16-02](#) single mode cable.

3/ Termination shall be performed so that the single fiber cable is affixed and crimped to the terminus. Epoxy and end face polishing is optional (see A.4.3.3).

A.5. Verification. Verification shall consist of the evaluation performed by the requesting party and by the approving activity as listed in [TABLE 6302 A-I](#) using the step specified in [TABLE 6302 A-II](#) and as further detailed in A.5.1.

A.5.1 Evaluation. The evaluation shall include the inspections and measurements in A.5.1.1 through A.5.1.3.

A.5.1.1 Terminus removal tool initial inspections. During the terminus removal tool initial inspections, the evaluator shall rate terminus removal tool performance as listed in A.5.1.1.a through g.

- a. Function (terminus extraction process).
- b. Length, retention clip exposure.
- c. Length, gap.
- d. Envelope dimensions.
- e. Cable jacket damage protection.
- f. Durability.
- g. Corrosion.
- h. Hardness
- i. Markings

A.5.1.2 100 removal cycles performed. The removal cycles shall be performed as cited in [TABLE 6302 A-I](#). After the 100 removal cycles are performed, the evaluator shall rate terminus removal tool performance as listed in A.5.1.2.a through d.

- a. Function (terminus extraction process).
- b. Cable jacket damage protection.
- c. Durability.
- d. Other input on the terminus removal tool performance.

A.5.1.3 Post 100 removal cycles visual and mechanical inspection. The visual and mechanical inspection shall be performed in accordance with [MIL-STD-1678-3](#) Measurement 3105 with note 4/ of [TABLE 6302 A-II](#).

A.5.2 Evaluation package. An evaluation package shall be prepared for each terminus removal tool. The evaluation package shall include the documentation listed in A.5.2.a through c.

- a. Evaluation sheets. Evaluation sheets used shall include the content as on the evaluation sheets in [appendix B](#).
- b. Data sheet information as specified in 4.2 and applicable items in [TABLE 2201 A-I](#) of [MIL-STD-1678-2](#) Measurement 2201. This information may appear on a separate General Data Sheet (cover sheet) or incorporated into the evaluation sheet.
- c. Summary sheet with summary or table of inspections and measurements, the result (findings) of each, approval or recommended corrective actions, other pertinent input, signature or initials of reviewer or authority at approving activity. Summary sheet may be first page of the evaluation package.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6302

APPENDIX A

A.6. Notes.

A.6.1 Intents behind standardization efforts.

A.6.1.1 Multiple party testing considerations. The incentive to minimize test variables, resulting in a level playing field for multiple parties testing, leads the Government to establish a baseline. This baseline includes considerations for fabrication of test samples, methods to verify actions/measurements and use of specific test practices in addition to specifics for test sample configurations.

APPENDIX B

TERMINUS REMOVAL TOOL EVALUATION SHEETS

B.1 Excerpt from evaluation sheets to illustrate (1) terminus removal tool initial inspections, (2) 100 terminus removals performed with post 100 terminus removal inspections, and (3) visual and mechanical inspection. Criteria listed in the evaluation sheets is taken from [TABLE 6302 A- I](#).

a. Excerpt from an evaluation sheet to illustrate the terminus removal tool initial inspections.

TABLE 6302 B-I Evaluation sheet for terminus removal tool inspection.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
Function (terminus extraction process)	Terminus shall be extracted successfully when the following procedure is performed: Terminus removal tool tip shall be fitted around the cylindrical surface of the terminus retention clip. Apply an upward load (force) (i.e., towards the rear of the terminus), pressing against the surface of the rear "lip" on the retention clip. Extract the terminus.		
Length, retention clip exposure.	Dimension for the tool tip that interfaces with the exposed length of the retention clip shall be designed to accommodate the dimensions specified in MIL-PRF-29504/18 and /20 (see figure 6302-1). Significantly shorter than maximum length of 0.050 inches (see 6.2).		
Length, gap.	Dimension for the tool tip that interfaces with the exposed length of the retention clip shall be designed to accommodate the maximum gap length in MIL-PRF-29504/18 and MIL-PRF-29504/20 (see figure 6302-1). This gap length is the one between the back of the retention clip and the front (leftmost surface) of the rear shoulder. This gap length is the resultant exposed length (or gap) when the retention clip is in the most forward position in an unmated condition. Significantly longer than minimum length of 0.030 inches (see 6.3)		
Envelope dimensions	Initial: Tool envelope dimensions are no greater than those dimensions specified in figure 6302-2 .		
Cable jacket damage prevention.	Initial: No sharp edges on tool tip (see figure 6302-1).		
Durability	Pass: Metal that is sufficiently durable to survive 1000 extractions (termini removals). Sufficiently durable: If acceptable material used (4.3.3 materials; M2 steel plated for corrosion resistance or 410, 416, 420 CRES; are acceptable for tool tip) and withstands applied load with no evidence of breakage, cracking, chipping or other damage that would impair tool terminus removal function. <u>1/</u>		
Corrosion	Material is sufficiently corrosion resistant (300 or 400 series stainless steel is acceptable for body; M2 steel plated for corrosion resistance or 410, 416, 420 CRES per 4.3.3 for tool tip). <u>2/</u>		
Hardness	Initial: <u>1/</u>		
Markings	Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code		

1/ Certifications required: material to verify durability, corrosion and hardness.

2/ Certification provided that the terminus removal tool meets the [MIL-STD-1678-3](#) Measurement 3401 requirement for a 48 hour salt spray test (equivalent to MIL-STD-202 Method 101). Certification shall include that testing was performed on terminus removal tool under evaluation or a tool/component with the same material(s).

REQUIREMENT 6302

APPENDIX B

b. Excerpt from an evaluation sheet to illustrate terminus removal tool post 100 removal cycles inspection.

TABLE 6304 B-II Evaluation sheet for terminus removal tool removals and post 100 removal cycles inspections.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
100 removal cycles	Perform 100 terminus extractions (removals). ^{1/} Successfully performed 100 extractions without any breakage or distortions of the terminus removal tool. Adjacent termini do not impede terminus extraction due to the geometry of the terminus removal tool.		
Function (terminus extraction process)	Terminus removal tool tip shall perform 100 terminus extractions with no binding or loosening (terminus wobbling).		
Cable jacket damage prevention.	No tool tip grabbing, nicking, scrapping or tearing of the cable jacket observed.		
Durability	Pass: Metal that is sufficiently durable to survive 1000 extractions (termini removals). Sufficiently durable: Without showing any signs of wear and degradation in function during and after completion of 100 removal cycles.		
Other input on the terminus removal tool performance			

^{1/} One hundred (100) removal cycles of terminus extractions shall be performed using the ten terminated cable assembly pigtails specified in [TABLE 6302-III](#). The ten terminated cable assembly pigtails shall be placed in the insert rear face upper right quadrant cavity positions (18, 2, 3, 4, 5, 19, 20, 21, 31, and 32) of one shell size 23 MIL-PRF-64266 connector plug with a 36 cavity insert. Each of the ten terminated cable assembly pigtails shall be extracted successfully. When extracting the terminus in position 3 and when extracting the terminus in position 20, the other nine terminated cable assembly pigtails shall be installed. Adjacent termini shall not impede terminus extraction due to the geometry of the terminus removal tool. Next, these ten terminated cable assembly pigtails shall be placed in the same insert cavity positions of the same shell size 23 MIL-PRF-64266 connector plug with a 36 cavity insert and extracted an additional four times for a total of five extractions for each of the ten terminated cable assembly pigtails. The ten terminated cable assembly pigtails shall be placed in the insert rear face left quadrant cavity positions (6, 7, 19, 20, 21, 22, 23, 31, 32 and 33) positions of one shell size 23 MIL-PRF-64266 connector receptacle with a 36 cavity insert. When extracting the terminus in position 6 and when extracting the terminus in position 32, the other nine terminated cable assembly pigtails shall be installed. Adjacent termini shall not impede terminus extraction due to the geometry of the terminus removal tool. The same process shall be repeated for a total of five extractions for each of the ten terminated cable assembly pigtails.

REQUIREMENT 6302

APPENDIX B

TABLE 6302 B-III Evaluation sheet for cable assembly post 100 removal cycles visual and mechanical inspection.

If a failure is recorded, provide details on the extent of the failure observed (on bottom on data sheet).

1. Identification markings and color.a. Markings.

Criteria: All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Pass_____ All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Fail_____ All markings are not present. Specify on data sheet.

_____ Height of markings is too small to read/distinguish characters. Specify on data sheet.

_____ Markings are insufficiently legible (legible is if each character can be easily identified, even if some of the print is faded or removed). Specify on data sheet.

_____ Markings are not permanent (permanent is if markings remain legible after completion of qualification test sequence). Specify on data sheet.

2. Workmanship, visual.a. Finish imperfections.

Criteria: No peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

Pass_____ No finish imperfections observed that is detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail_____ Observed sufficient peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

b. Surface imperfections.

Criteria: No rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations.

Pass_____ No surface imperfections observed that are detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail_____ Observed sufficient rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations. Specify on data sheet.

c. Part imperfections.

Criteria: Product/parts are dimensionally uniform, free of lumps, kinks, splits, scraped or abraded surfaces, inclusions or other imperfections.

Pass_____ No part imperfections observed that are detrimental to form, fit or function or that could result in further protective material or function degradation

MIL-STD-1678-6A

REQUIREMENT 6303

FERRULE END FACE CLEANING SWAB AND TOOL INTERFACE REQUIREMENTS
(THROUGH MIL-PRF-64266 TEST TERMINUS ADAPTER)

1. Purpose. The interface requirements for cleaning of the fiber optic termini through a test terminus adapter (see 6.4) are specified herein. These interface requirements are applicable to cleaning swabs and tools to clean the ferrule end faces of the MIL-PRF-29504/18 and MIL-PRF-29504/20 termini when a test terminus adapter is affixed to (threaded onto) the MIL-PRF-64266 connector. The intent is to provide envelop dimensions to enable selection from multiple sources of supply. Different swab and tool configurations exist; however, the interface dimensions provided must be used to verify acceptable swab/tool insertion through the test terminus adapter to the termini. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, function. The cleaning swab or tool used to clean the ferrule end face of a MIL-PRF-29504/18 and MIL-PRF-29504/20 terminus through a test terminus adapter must not exceed envelop dimension that would not permit insertion through the test terminus adapter. Also, the cleaning swab or tool must be adequate to pass through the fingers of a retaining clip within each cavity of the test terminus adapter. These interface considerations are the ones that must be considered in the design of the ferrule end face cleaning tool when used through a test terminus adapter. The requirements are cited in 4.1.

1.2 Supplemental, item number. Item numbers assigned to the ferrule end face cleaning tools that can be inserted through a test terminus adapter are 6201AK (see [Requirement 6201](#)).

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-29504/18](#) - Termini, Fiber Optic, Connector, Removable, Environment Resisting, Genderless Terminus, Rear Release, Ceramic Ferrule, 1.25 MM Ferrule, (for MIL-PRF-64266 Connectors).
- [MIL-PRF-29504/20](#) - Termini, Keyed, Fiber Optic Connector, Removable, Environment Resisting, Genderless Terminus, Rear Release, Ceramic Ferrule, 1.25 MM Ferrule, (For MIL-PRF-64266 Connectors).

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6303

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Alignment sleeve. A cylindrical, split ceramic tube that provides the mechanical and optical alignment of two mating connector/terminus ferrules.

3.2 Alignment sleeve retainer. An alignment sleeve retainer is a separate and removable housing used within the connector shell to retain captive alignment sleeves. The alignment sleeve retainer is part of the MIL-PRF-64266 connector. Use of an alignment sleeve retainer allows a one, genderless (really pin) terminus to be used in both the MIL-PRF-64266 connector plug and the connector receptacle. Functional/optical alignment is provided by the alignment sleeve retainer thorough the use of guide pins and alignment sleeves. A captive "jackscrew", which is a part of the alignment sleeve retainer, retains the alignment sleeve retainer within the connector shell.

3.3 ASR. Alignment sleeve retainer.

3.4 Swab, cleaning. A stick containing a lint-free, particulate and fluid absorbing pad on one or both ends and used to clean the ferrule end faces of fiber optic connectors and termini.

3.5 Termini. A component used in a fiber optic, multiple termini, connection that is inserted into one of the insert cavities of a multiple termini connector, provides a means to break and rejoin an optical path, and is terminated onto the end of a simplex, fiber optic cable. The term "termini" is the plural form for the word terminus.

3.6 Terminus. Singular form for the word termini.

3.7 Tool, cleaning. A device or mechanical machine that contains (1) a cleaning cartridge, tape or ribbon; (2) a means to advance the cleaning cartridge, tape or ribbon; (3) a lint-free, particulate and fluid absorbing media on the cleaning cartridge, tape or ribbon that is used to clean the ferrule end faces of fiber optic connectors and termini; (4) and is configured with a tip to allow access for cleaning the ferrule end faces of fiber optic connectors and termini.

4. Requirements. The interface (envelop) dimensions of the cleaning swab or tool shall be standardized for commonality compliance across platforms to ensure the ability to clean the ferrule end faces of MIL-PRF-29504/18 and MIL-PRF-29504/20 termini through a test terminus adapter when these termini are inserted into a MIL-PRF-64266 multiple termini connector). Commonality compliance is that in which bounds or restricts the parts to those cited in this Standard Practice. Requirements for the terminus removal tool interface with the termini shall comply with 4.1 through 4.4.

4.1 Functional. The cleaning swab or tool shall be capable of being inserted through a test terminus adapter to clean the ferrule end face of the terminus.

4.2 Dimensional.

4.2.1 Diameters. The diameters at the tip that interfaces with the test terminus adapter and ferrule end face shall be designed to fit into the envelop dimensions specified in [figure 6303 – 1](#).

4.2.2 Lengths. The linear dimensions or lengths at the tip that interfaces with the test terminus adapter and ferrule end face shall be designed to fit into the envelop dimensions specified in [figure 6303-1](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6303

FIGURE 6303 – 1. Cleaning swab/tool interface dimensions for MIL-PRF-64266 test terminus adapter.

4.3 Material. Terminus removal tool material shall meet the durability, corrosion and applied load requirements of 4.3.1 through 4.4.

4.3.1 Hardness. Material used for the swab stick (handle) or tool housing shall be sufficiently hard to survive the insertion and extraction (terminus removal) through the fingers of the retaining clip within a test terminus adapter. For cleaning tools, the cleaning tool housing shall survive 1000 insertions and extractions without showing any signs of wear and degradation in function.

4.3.2 Fungus resistant. Material used for the cleaning tool housing shall be fungus resistant type plastic.

4.4 Applied load. The cleaning swab or tool shall fit through the test terminus adapter without any external load applied.

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic cleaning swabs and tools specified for use through a test terminus adapter shall incorporate the interface requirements of 4.1 through 4.4. Verification of these requirements shall comply with 5.1 through 5.4.

5.1 Responsibility. Unless otherwise specified by the procuring activity, the supplier is responsible for the performance of all items contained herein with regard to the above requirements.

5.2 Performance verification. Dimensional and material data for the cleaning swab or tool tip along with verification that an applied load is not required for obtaining access to the ferrule end face may be provided to demonstrate performance; however, the Procuring Activity reserves the right to perform any of the inspections specified. When specified, test samples shall be submitted to the designated Design Activity for approval.

5.3 Performance demonstration with fully populated connectors. When specified, test data submitted shall include verification for demonstration of successful cleaning of each insert cavity position in each shell size connector. As an alternative and when specified, selected insert cavity positions may be specified instead.

5.4 Restrictions. Terminus cleaning of the insert cavity shall be performed on unmated connector plugs with no alignment sleeve retainer (ASR). Terminus cleaning of the insert cavity shall be performed on unmated connector receptacles with the alignment sleeve retainer (ASR) in place.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic cleaning swabs and tools are used to clean the ferrule end face of termini in a MIL-PRF-64266 multiple termini connector through a test terminus adapter. These connectors are a part of or can be found on (1) cable harnesses and (2) equipment (electronic module/package) such as an ATR, LRC, LRM, LRU or WRA with internal fiber optics.

6.2 Dimensional constraints. Dimension of .048 MAX is based on a maximum ferrule diameter of 1.25 mm (0.049 inch).

6.3 Material considerations. Material should be sufficiently hard to withstand travel through the fingers of the retaining clip within each cavity of the test terminus adapter.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

POLISHING PUCK INTERFACE REQUIREMENTS
(FOR PC and APC POLISHING OF FERRULE END FACES)

1. Purpose. The interface requirements for a fiber optic termini polishing puck (tool) are specified herein. These interface requirements are applicable to the fiber optic termini (such as the MIL-PRF-29504/4, MIL-PRF-29504/5, MIL-PRF-29504/14, MIL-PRF-29504/15, MIL-PRF-29504/18 and MIL-PRF-29504/20 termini, the test probe used in MIL-DTL-38999 and the MIL-PRF-29504 test termini used in MIL-PRF-28876 and MIL-PRF-64266 multiple termini connectors) and are applicable for single ferrule connectors (such as the FC, LC, SC and ST connectors). The intent is to provide polishing pucks from multiple sources of supply that gives the Fleet/Field maintainer the ability to polish the applicable configuration terminus or single ferrule connector from all qualified termini sources of supply. Different polishing puck configurations exist; however, the interface dimensions of the tool tip must conform to those of the specific terminus or single ferrule connector and polish type (PC or APC polish). This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, item number. Item number assigned to approved polishing pucks are found in [Requirement 6204](#). For Navy Shipboard applications, approved polishing pucks are found in the Navy Shipboard Fiber Optic Recommended Tool List also.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-PRF-29504	-	Termini, Fiber Optic Connector, Removable, General Specification For.
MIL-PRF-29504/4	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Pin Terminus, Size 16, Rear Release, MIL-DTL-38999, Series III.
MIL-PRF-29504/5	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Socket Terminus, Size 16, Rear Release, MIL-DTL-38999, Series III.
MIL-PRF-29504/14	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Pin Terminus, Front Release, Ceramic Ferrule, (for MIL-PRF-28876 Connectors).
MIL-PRF-29504/15	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Socket Terminus, Front Release, Ceramic Ferrule, (for MIL-PRF-28876 Connectors).
MIL-PRF-29504/18	-	Termini, Fiber Optic, Connector, Removable, Environment Resisting, Genderless Terminus, Rear Release, Ceramic Ferrule, 1.25 MM Ferrule, (for MIL-PRF-64266 Connectors).
MIL-PRF-29504/20	-	Test terminus, Fiber Optic, Keyed, Connector, Removable, Environment Resisting, Genderless Terminus, Rear Insert/Rear Release, 1.25 mm Ceramic Ferrule, (for MIL-PRF-64266 Connectors).
MIL-PRF-29504/21	-	Test Terminus, Fiber Optic, Keyed, Removable, Use in Optical Loss and Optical Continuity Testing, Rear Insert/Rear Release Through a Test Terminus Adapter, 1.25 mm Ceramic Ferrule, 1.25 mm Ferrule, (for MIL-PRF-64266 Connectors).
MIL-DTL-38999	-	Connectors, Electrical, Circular, Miniature, High Density, Quick Disconnect, (Bayonet Threaded and Breech Coupling), General Specification for.
MIL-PRF-64266	-	Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for
MIL-DTL-83522	-	Connectors, Fiber Optic, Single Terminus, General Specification for.

REQUIREMENT 6304

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4- Installation and Testing Practices, Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.4 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

TELECOMMUNICATIONS INDUSTRY ASSOCIATION

TIA-604-1 - FOCIS 1 FIBER OPTIC CONNECTOR INTERMATEABILITY STANDARD

(Copies are available online at www.tiaonline.org/standards/catalog/index.cfm or from TIA, 2500 Wilson Boulevard, Suite 300, Arlington, VA 22201, USA, ATTN: Standards Department.

2.5 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Connector, fiber optic. A device that permits repeated mating and couples the optical power between two optical fibers or two groups of optical fibers. A fiber optic connector must maintain fiber alignment without significant loss of optical power.

3.2 Connector, LC. The Lampert connector or Lucent connector (LC) is a single ferrule connector with a 1.25 mm (.05 inch) ferrule diameter, a push-pull style attachment configuration to the mating an LC-to-LC adapter/patch panel or equipment interface port, and a butt-jointed connector design. The LC connector has a small form factor configuration that has the same footprint as a RJ-45 receptacle.

3.3 Polish, non-contact (NC). Ferrule end face is polished in a manner so that the fibers are the first to make contact when connection surfaces are mated together.

3.4 Polish, physical contact (PC). Ferrule end face is polished in a manner so that the fibers are the first to make contact when connection surfaces are mated together.

3.5 Polishing puck (tool), APC polish. A fixture used in the polishing process to hold the ferrule of a single ferrule connector or a terminus so that ferrule end face is at an 8 degree angle from the perpendicular and extends below the fixture's flat bottom.

3.6 Polishing puck (tool), PC polish. A fixture used in the polishing process to hold the ferrule of a single ferrule connector or a terminus so that ferrule end face is perpendicular to and extends below the fixture's flat bottom.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

3.7 Termini. A component used in a fiber optic, multiple termini, connection that is inserted into one of the insert cavity of a multiple termini connector and terminated onto the end of a simplex, fiber optic cable. Termini is the plural form for the word terminus.

3.8 Terminus. Singular form for the word termini.

3.9 Terminus, pin. The male configuration of a terminus that consists of a metal barrel (body) and a metal or ceramic ferrule.

3.10 Terminus, socket. The female configuration of a terminus that consists of a metal barrel (body), a metal or ceramic ferrule and an alignment sleeve. The alignment sleeve attaches to the socket terminus ferrule. Fiber alignment occurs when the pin terminus slides into the alignment sleeve of the socket terminus.

3.11 Test probe. A single fiber MQJ that is configured with a connector at one end to mate with the test equipment and a connector referred to as "test probe" at the other end. The test probe is test connector that is used to test one terminus at a time within a MIL-DTL-38999 connector. This test probe is inserted into the cavity of a test probe adapter. The test probe adapter is mated to the MIL-DTL-38999 connector.

3.12 Test probe adapter. An adapter that mates with the MIL-DTL-38999 multiple termini connector plug or the MIL-DTL-38999 connector receptacle under test and that contains the insert cavity configuration to mate with and lock a test probe in place.

3.13 Test terminus. A single fiber MQJ that is configured with a connector at one end to mate with the test equipment and a connector referred to as "test terminus" at the other end. The test terminus is test connector that is used to test one terminus at a time within a MIL-PRF-64266 connector. This test terminus is inserted into the cavity of a test terminus adapter. The test terminus adapter is mated to the MIL-PRF-64266 connector.

3.14 Test terminus adapter. An adapter that mates with the MIL-PRF-64266 multiple termini connector plug or the MIL-PRF-64266 connector receptacle under test and that contains the insert cavity configuration to mate with and lock a test terminus in place.

4. Requirements. The dimensions and interface features of the fiber optic polishing puck shall be standardized for commonality compliance across platforms to ensure the ability to place the specified end face geometry onto the end face of the single ferrule connector or terminus ferrule. Commonality compliance is that in which bounds or restricts the parts to those cited in this Standard Practice. Requirements for the polishing puck shall comply with 4.1 through 4.4.

4.1 Configuration. Polishing pucks shall be standardized to the extent that interoperability with any of the same type (such as pin or socket) and configuration (per a military specification sheet) single ferrule connector or terminus is achieved by the polishing puck accommodating the minimum length for ferrule protrusion.

4.2 Dimensional requirements. Polishing puck shall meet the dimensional requirements of 4.2.1 through 4.2.4 and [figure 6304 - 1](#).

4.2.1 Interface with ferrule. The standardized polishing puck shall accommodate the specified single ferrule connector or terminus with the maximum envelope dimensions, as defined in military specification sheet.

4.2.2 Length of ferrule protrusion from the terminus barrel (body). Polishing puck shall be designed to accommodate a minimum exposed ferrule length or minimum ferrule protrusion from the single ferrule connector or terminus barrel (body).

4.2.3 Ferrule perpendicularity. The single ferrule connector or terminus ferrule shall be retained in the standardized polishing puck so that it remains perpendicular, along its axial (versus radial) direction, to the polishing surface of the polishing puck. For an APC polishing puck, this requirement shall be offset by an 8 degree angle.

4.2.4 Interface documents. For fiber optic termini, the applicable specification sheets include MIL-PRF-29504/4, MIL-PRF-29504/5, MIL-PRF-29504/14, MIL-PRF-29504/15, MIL-PRF-29504/18, MIL-PRF-29504/20 and MIL-PRF-29504/21. For single ferrule connectors, the applicable military specification is MIL-DTL-83522. Otherwise, interface document used for a single ferrule connector shall conform to the applicable [TIA-604-1](#) fiber optic connector intermateability standard.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

4.3 Mechanical requirements. Polishing puck shall meet the mechanical requirements of 4.3.1 through 4.3.3.

4.3.1 Envelope dimension. The standardized polishing puck shall accommodate a single ferrule connector or terminus with the maximum envelope dimensions, as defined in the military specification sheet or applicable interface document.

4.3.2 Grooved polishing surface. Standardized polishing pucks shall not be grooved. Grooved polishing pucks have been found to retain debris from the polishing film and other grit in the grooves.

4.3.3 Sufficiently large exiting diameter for cable assembly. This requirement is applicable if the specific polishing puck design includes a collar or other restriction. Standardized polishing puck shall have a sufficiently large diameter opening to allow rear of single ferrule connector/terminus barrel (body) fit into the polishing puck when shrink sleeve/tubing, aramid yarn (such as Kevlar) bunches up or other fabrication anomalies require the opening to be increased.

4.3.4 Diameter of the polishing puck. The polishing puck shall be between 1.5 to 2.0 inches in diameter. The smaller the ferrule diameter, the larger should be the polishing puck diameter.

4.3.5 Hole tolerance. A tight fit is required on this polishing puck hole diameter that interfaces with the ferrule. A tolerance of $\pm .001$ inches is acceptable.

4.4 Physical requirements. Polishing puck shall meet the physical requirements of 4.4.1 and 4.4.2.

4.4.1 Grip. Polishing puck shall be configured to grasp both the single ferrule connector/terminus barrel (body) and the polishing puck interface (such as a collar).

4.4.2 Applied weight. Polishing puck shall be designed to glide easily when an applied weight (i.e., hand pressure) is placed on the polishing puck during the polishing process.

4.5 Material requirements. Polishing puck shall meet the durability and corrosion requirements of 4.5.1 through 4.5.3.

4.5.1 Durability. Material used for the polishing puck shall be metal that is sufficiently durable to survive a minimum of 500 polishes (with each polish consisting of a minimum of three polishing steps) without showing any signs of wear and degradation in function.

4.5.2 Corrosion. Material used for the polishing puck shall be corrosion resistant. If stainless steel 300 series stainless steel is acceptable.

4.5.3 Surface finish. Unless otherwise specified, the same polishing puck is intended for use in each step of the polishing process. When specified, two polishing pucks shall be provided for the initial (course and intermediate) and final (fine) polishing steps. The polishing puck for the fine polish shall be mirrored on the surface that interfaces with the polishing film (paper) to a .032 finish minimum and .064 finish preferred.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

FIGURE 6304 - 1 Polishing puck dimensions and interface features.

4.6 Alternative tools. A machine polish may be used in lieu of a hand polish. Alternate tool (machine or polishing puck) is allowed for preparation of qualification test samples as long as required end face geometry and optical performance (insertion loss and return loss) is produced.

4.7 Markings. Polishing puck shall be marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code. Markings shall be of minimum readable height (able to read/distinguish characters), and of sufficient legibility (each character can be easily identified, even if some of the print is faded or removed) and permanency (if markings remain legible after completion of qualification test sequence).

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic polishing puck shall incorporate the interface dimensions in above figure 6304-1 and the interface requirements of 4.1 through 4.5. Verification of these requirements shall comply with 5.1 through 5.4.

5.1 Responsibility. Unless otherwise specified by the procuring activity, the supplier is responsible for the performance of all items contained herein with regard to the above requirements.

5.2 Performance verification. Dimensional data for polishing puck may be provided to demonstrate performance; however, the Procuring Activity reserves the right to perform any of the inspections specified to verify suitable end face geometry is being obtained. Unless otherwise specified, test samples shall be submitted to the designated Approving Activity (see Appendix A) for approval.

5.2.1 Evaluation criteria. When the polishing puck is evaluated by the Approving Activity, the evaluation criteria used shall include the criteria as found in Appendix A.

5.2.2 Evaluation sheets. When the polishing puck is evaluated by the Approving Activity, the evaluation sheets used shall include the content as on the evaluation sheets in Appendix B.

5.3 Performance demonstration for insertion and removal. When specified, test data submitted shall include verification for demonstration of successful single ferrule connector or terminus insertion and extraction from the polishing puck.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

5.4 Restrictions. When specified or for shipboard applications test data shall include the ferrule height obtained.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic polishing puck are used to polish termini for a single ferrule connectors/ termini that are a part of (1) cable harnesses, and (2) equipment (electronic module/package) such as a ATR, LRC, LRM, LRU or WRA with internal fiber optics.

An automated reply will contain the current web address.)

A.3 Definitions.

A.3.1 Approving activity. Unless otherwise specified, Naval Surface Warfare Center Dahlgren Division (NSWC DD) is the approving activity for approval to use a polishing puck as specified in Requirement 6304.

A.3.2 Requesting party. Activity or vendor requests approval. Process begins by providing a polishing puck (with specified certifications and polishing samples), being evaluated, and if in compliance, being placed on the Navy Shipboard Fiber Optic Recommended Tool List and into [MIL-STD-1678-6](#). Consideration for approval is based on demonstrating compliance as specified in Requirement 6304.

A.4 Requirements.

A.4.1 Evaluation criteria. Polishing puck shall meet the criteria in [TABLE 6304 A- I](#). The evaluation process, including the requesting party's submissions, shall be performed in accordance with the steps listed in [TABLE 6304 A- II](#).

A.4.2 Certifications.

A.4.2.1 Certifications with initial submission. Certifications shall be submitted for polishing puck material (verify hole tolerance, durability and corrosion) and for the surface finish of the polishing puck bottom (polishing) surface.

A.4.2.2 Modifications and replacements. Once evaluated and approved, the approving activity shall be notified in writing or by e-mail of any modifications or substitutions made to the polishing puck. Details of the modification or substitution shall be provided for the approving activity's determination if any or all portions of the evaluation need to be redone. Details should include any certifications and other documentation needed to make this determination.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

APPENDIX A

A.4.3 Terminated cable assemblies

A.4.3.1 Test sample configuration (terminated cable assembly). Terminated cable assemblies shall be included as part of the submission. Terminated cable assemblies with the applicable connectors/termini for the polishing puck submitted shall be selected from [TABLE 6304-III](#). Termination onto the ends of MIL-PRF-84045/16 to comprise the terminated cable assembly shall be performed once step 5 in [TABLE 6304-II](#) is completed. Termination performed on the test sample end shall include the steps up to and including the air polish. Connectors to be placed on each end of the MIL-PRF-85045/16 cable shall be those listed in [TABLE 6304-III](#). Specific cable type used (i.e., either MIL-PRF-85045/16-01 or MIL-PRF-85045/16-02) shall conform to [TABLE 6304-III](#).

A.4.3.2 Applicable connector/terminus types. Terminated cable assemblies along with the connectors/termini used (in [TABLE 6304-III](#)) may be tailored by the approving activity depending upon the connector/terminus types to be covered under the polishing process submitted for approval.

A.4.3.3 Termination. Termination of the instrument end connectors and the polishing samples (single ferrule connectors or termini) shall be performed in accordance with MIL-STD-2042. When specified, these terminations, including polishing, shall be in accordance with [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

APPENDIX A

TABLE 6304 A-I Evaluation table for polishing puck.

Parameter	Pass Criteria	Requirement	
Interface with ferrule.	Initial: Polishing puck cavity shall accommodate the specified single ferrule connector or terminus with the maximum envelope dimensions. Post 10 polishings: Ferrule inserted into, polished successfully, then removed from the polishing puck for 10 polishes with no binding or loosening (ferrule wobbling during polishing).	4.2.1	
Length of ferrule protrusion from the terminus barrel (body).	Initial: Accommodates a minimum exposed ferrule length or minimum ferrule protrusion from the single ferrule connector or terminus barrel (body). Minimum length is ≥ 1 mm.	4.2.2	
Ferrule perpendicularity.	Initial: Ferrule shall be retained in the polishing puck so that it remains perpendicular, along its axial (versus radial) direction, to the polishing surface for a PC polishing puck. For an APC polishing puck, this requirement shall be offset by an 8 degree angle. <u>1/</u>	4.3.2	
Envelope dimension.	Initial: Able to be inserted into the cavity at the maximum connector/terminus envelope dimensions. Able to insert into the keyway for a keyed connector or terminus.	4.3.1	
Grooved polishing surface	Initial: Not grooved on polishing surface.	4.3.2	
Sufficiently large exiting diameter for cable assembly.	Initial: Sufficiently large diameter opening to allow rear of single ferrule connector/terminus barrel (body) fit into the polishing puck when shrink sleeve/tubing, aramid yarn (such as Kevlar) bunches up or other fabrication anomalies require the opening to be increased. Applicability: Only if the specific design of polishing puck includes a collar or other restriction.	4.3.3	
Diameter of the polishing puck	Initial: Polishing puck diameter between 1.5 to 2.0 inches. Post 10 polishings: Polishing puck is easy to maneuver. Guidance: The smaller the ferrule diameter, the larger should be the polishing puck diameter.	4.3.4	
Hole tolerance	Initial: A tight fit of the ferrule in the polishing puck cavity. Guidance: A tolerance of $\pm .001$ inch hole diameter is acceptable. <u>3/</u>	4.3.5	
Grip	Initial: Able to grip easily both the single ferrule connector/terminus barrel (body) and the polishing puck interface (such as a collar). <u>2/</u> Post 10 polishings: Polishing puck is easy to maneuver. Connector/terminus does not move around during polishing (up/down and/or side-to-side).	4.4.1	
Applied weight	Initial: Polishing puck shall be designed to glide easily when an applied weight (i.e., hand pressure) is placed on the polishing puck during the polishing process.	4.4.2	
Durability	Pass: Metal that is sufficiently durable to survive 500 polishes. Sufficiently durable: Initial - If acceptable material used (300 series stainless steel is acceptable) Post 10 polishings - Without showing any signs of wear and degradation in function after completion of 10 connector/terminus polishings. <u>3/</u>	4.5.1	

See footnotes at end of table.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

APPENDIX A

TABLE 6304 A-I Evaluation table for polishing puck – continued.

Parameter	Pass Criteria	Requirement	
Corrosion	Initial: Corrosion resistant (300 series stainless steel is acceptable). <u>3/</u>	4.5.2	
Surface finish	Initial: .032 finish minimum (.064 finish preferred). <u>3/</u>	4.5.3	
Markings	Initial: Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code Post polish visual and mechanical inspection: easily identifiable, legibility and permanency	4.7	
Post-polish visual and mech	Workmanship: finish, surface, and part imperfections; matability with terminus/connector Markings: easily identifiable, legibility and permanency	MIL-STD-1678-3 Measurements 3103, 3104	
End face geometry	Apex offset: ≤ 50 microns (PC), ≤ 70 microns (APC) Radius of curvature (ROC): 7 to 25 mm (PC), 5 to 12 mm (APC) Fiber height: Undercut: TABLE 5201 B-IV, Protrusion: ≤ 50 nm (PC), ≤ 100 nm (APC) Angle (APC only): 7.5 to 8.X degrees	MIL-STD-1678-5 Measurement 5201	
Return loss	≥ 30 dB (PC polish), ≥ 40 dB (enhanced PC polish), ≥ 60 dB (APC polish)	MIL-STD-1678-2 Measurement 2105	
Insertion loss	≤ 0.75 dB (MIL-PRF-29504/14, /15, MIL-PRF-83522, MIL-PRF-29504/4, /5 SM), ≤ 0.50 dB (MIL-PRF-29504/18, /20), ≤ 0.75 dB (MIL-PRF-29504/4, /5 single mode)	MIL-STD-1678-2 Measurement 2101	
Ferrule length removed	$\leq .003$ inch (PC), $\leq .006$ inch (APC) NOTE: Best guess - Actual pass values TBD	MIL-STD-1678-6 Measurement 6305	

1/ An APC polishing puck can be designed so that the bottom surface is not parallel with the polishing paper, leaving one side higher at an 8 degree angle. This design is found to make polishing a bit awkward compared to polishing with a "normal" polishing puck (such as a PC polishing puck). Users were not able to consecutively achieve polishing an 8 degree angle with this polishing puck design.

2/ A wider collar or neck on the polishing puck is found to make gripping the single ferrule connector/terminus and holding it in place from slight to moderately more difficult.

3/ Certifications required: material (verify hole tolerance, durability and corrosion), surface finish of polishing puck bottom (polishing) surface.

REQUIREMENT 6304

APPENDIX A

TABLE 6304 A-II. Actions (steps) required for polishing approval process.

Step	Action	Submits ^{1/}	Receives ^{1/}	Addendum
1	Submits request, including required certifications and polishing puck	Requesting Party	Approving Activity	<u>2/</u>
2	Performs polishing puck initial inspections in TABLE 6304 A-I up to post polish visual inspection	Approving Activity	See step 3	
3	Provides feedback on either to proceed or not-proceed with approval process	Approving Activity	Requesting Party	
4	Submits unterminated samples (pre-polished submittal, see TABLE 6304 A-III) for measurement of ferrule protrusion length	Requesting Party	Approving Activity	<u>3/</u>
5	Measures pre-polished ferrule protrusion length and returns samples	Approving Activity	Requesting Party	
6	Performs termination in accordance with MIL-STD-2042 except stops after air polish on single ferrule connector or terminus (test sample) end to be polished during evaluation	Requesting Party	Approving Activity	<u>4/</u> , <u>5/</u>
7	Performs polishing steps in accordance with MIL-STD-2042	Approving Activity	See step 9	<u>6/</u>
8	Performs the following post polished measurements:			
8a	Visual and mechanical inspection	Approving Activity	See step 9	<u>7/</u>
8b	End face geometry	Approving Activity	See step 9	<u>8/</u>
8c	Return loss	Approving Activity	See step 9	<u>8/</u>
8d	Insertion loss	Approving Activity	See step 9	<u>8/</u>
8e	Ferrule protrusion length	Approving Activity	See step 9	<u>9/</u>
9	Provides results and decision on approval of polishing puck	Approving Activity	Requesting Party	

Notes:

^{1/} See A.3.1 and A.3.2.^{2/} When specified, these include the following items that are applicable to request: connectors, standard/enhanced polishing materials, measurement/reference quality jumpers.^{3/} Samples or packaging shall have a unique marking so that the sample can be tracked for the post polishing stock length measurement.^{4/} Samples shall maintain the same unique identification marking for each connector/terminus used in step 4.^{5/} When specified, the Government may require witnessing of the process at manufacturer location.^{6/} For instrument end connectors, end face geometry data should be submitted also, if available.^{7/} Perform in accordance with (IAW) criteria specified in [TABLE 6304 A-I](#) supplemented by [MIL-STD-2042](#), and by [MIL-STD-1678](#) measurement 5202.^{8/} Criteria: See [TABLE 6304 A-I](#).^{9/} Results will be compared to other similar studies for acceptance.

	M29504/14 & /15	ST-to-MIL-PRF-29504/15 8/	2	--
	M29504/14 & /15	ST-to-MIL-PRF-29504/15 9/	2	--
2.5 mm PC polish	ST connector	ST-to-ST connectors	5	--
	SC connector	SC-to-SC connectors	5	--
2.5 mm APC polish 11/	SC connector	APC SC-to-SC connectors	--	10

1/ Specified polish on instrument end. Terminate to air polish on test sample end. Cable assembly minimum length is 1 meter from ferrule tip (end face) to ferrule tip. With the exception of SC connectors, instrument end connectors are to be COTS connectors from [Navy Recommended Fiber Optic Components Parts List](#).

2/ SM = Single Mode.

3/ Standard PC polish is the standard procedure for the domed end polish in [MIL-STD-2042](#).

4/ APC polish is the procedure for the 8 degree angle, domed end polish in [MIL-STD-2042](#).

5/ Cable assembly shall be constructed with MIL-PRF-85045/16-021 single mode cable for test sample connectors/termini with a PC polish.

6/ Cable assembly shall be constructed with MIL-PRF-85045/16-02 single mode cable for test sample connectors/termini with an APC polish.

7/ Cable assembly with an APC polish shall be terminated with APC polished SC connectors, not ST connectors.

8/ Delphi or other QPL source with a narrow pedestal ferrule end face.

9/ AFSI or other QPL source with a broad pedestal ferrule end face.

10/ Same 1.25 mm polishing puck can be used if no keyway is required.

11/ To accommodate the unique specifications of the specified keyed terminus or single ferrule connector, a keyway is required for an APC polishing puck. Unless otherwise specified, the PC polishing puck is assumed to be generic for a specific ferrule diameter.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

APPENDIX A

A.5. Verification. Verification shall consist of the evaluation performed by the requesting party and by the approving activity as listed in [TABLE 6304 A-I](#) using the step specified in [TABLE 6304 A-II](#) and as further detailed in A.5.1 through A.5.4.

A.5.1 Evaluation. The evaluation shall include the inspections and measurements in A.5.1.1 through A.5.1.4.

A.5.1.1 Polishing puck initial inspections. During the polishing puck initial inspections, the polishing puck performance shall be rated as listed in A.5.1.1.a through n.

- a. Interface with ferrule.
- b. Length of ferrule protrusion from the terminus barrel (body).
- c. Ferrule perpendicularity.
- d. Envelope dimension.
- e. Grooved polishing surface.
- f. Sufficiently large exiting diameter for cable assembly.
- g. Diameter of the polishing puck.
- h. Hole tolerance.
- i. Grip.
- j. Applied weight.
- k. Durability.
- l. Corrosion.
- m. Surface finish.
- n. Markings.

A.5.1.2 Pre-polished ferrule protrusion length. The pre-polished ferrule protrusion length shall be measured in accordance with A.5.2.

A.5.1.3 Polishing steps performed. The polishing steps cited in [MIL-STD-2042](#) shall be performed with the test sample (single ferrule connector or terminus) end of the cable assemblies as specified in [TABLE 6304 A-III](#). After the polishing steps are performed for the 10 test sample ends of the cable assembly, polishing puck performance shall be rated as listed in 5.1.3.a through e.

- a. Interface with ferrule.
- b. Diameter of the polishing puck.
- c. Grip.
- d. Durability.
- e. Other input on polishing puck performance.

A.5.1.4 Post polishing measurements. The post polishing measurements shall be performed in accordance with A.5.3.

A.5.2 Pre-polished ferrule protrusion length. Measurement shall be performed using a tool that complies with [MIL-STD-1678-6](#) Requirement 6305. Measurement of the ferrule protrusion length shall consist of the length as specified in 6.2 of [MIL-STD-1678-6](#) Requirement 6305.

A.5.3 Post polished measurements. Measurements shall be performed as listed in A.5.5.a through e.

- a. Measurement for visual and mechanical inspection: MIL-STD-1678-3 Measurement 3105 with note 7/ of [TABLE 6304 A-II](#).
- b. Measurement for end face geometry: MIL-STD-1678-5 Measurement 5201.
- c. Measurement for optical return loss: MIL-STD-1678-2 Measurement 2105.
- d. Measurement for optical insertion loss: MIL-STD-1678-2 Measurement 2101.
- e. Measurement for ferrule protrusion length: See A.5.2.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

APPENDIX A

A.5.4 Evaluation package. An evaluation package shall be prepared for each polishing puck. The evaluation package shall include the documentation listed in A.5.4.a through c.

- a. Evaluation sheets for initial and post polishing inspections, ferrule protrusion measurements and post polishing measurements. Evaluation sheets used shall include the content as on the evaluation sheets in appendix B.
- b. Data sheet information as specified in 4.2 and applicable items in TABLE 2201 A-I of MIL-STD-1678-2 Measurement 2201. This information may appear on a separate General Data Sheet (cover sheet) or incorporated into the evaluation sheet.
- c. Summary sheet with summary or table of inspections and measurements, the result (findings) of each, approval or recommended corrective actions, other pertinent input, signature or initials of reviewer or authority at approving activity. Summary sheet may be first page of the evaluation package.

A.6. Notes.

A.6.1 Intents behind standardization efforts.

A.6.1.1 Multiple party testing considerations. The incentive to minimize test variables, resulting in a level playing field for multiple parties testing, leads the Government to establish a baseline. This baseline includes considerations for fabrication of test samples, methods to verify actions/measurements and use of specific test practices in addition to specifics for test sample configurations.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6304

APPENDIX B

POLISHING PUCK EVALUATION SHEETS

B.1 Excerpt from evaluation sheets to illustrate (1) polishing puck initial inspections, (2) Pre-polish and post polish ferrule length measurements, (3) Post 10 polishings inspections, and (4) individual post polishing measurements. Criteria listed in the evaluation sheets is taken from [TABLE 6304 A-I](#).

a. Excerpt from an evaluation sheet to illustrate the polishing puck initial inspections.

TABLE 6304 B-I Evaluation sheet for polishing puck initial inspection.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
Interface with ferrule.	Polishing puck cavity shall accommodate the specified single ferrule connector or terminus with the maximum envelope dimensions.		
Length of ferrule protrusion from the terminus barrel (body).	Accommodates a minimum exposed ferrule length or minimum ferrule protrusion from the single ferrule connector or terminus barrel (body). Minimum length is ≥ 1 mm.		
Ferrule perpendicularity.	Ferrule shall be retained in the polishing puck so that it remains perpendicular, along its axial (versus radial) direction, to the polishing surface for a PC polishing puck. For an APC polishing puck, this requirement shall be offset by an 8 degree angle. 1/		
Envelope dimension.	Able to be inserted into the cavity at the maximum connector/terminus envelope dimensions. Able to insert into the keyway for a keyed connector or terminus.		
Grooved polishing surface	Not grooved on polishing surface.		
Sufficiently large exiting diameter for cable assembly.	Sufficiently large diameter opening to allow rear of single ferrule connector/terminus barrel (body) fit into the polishing puck when shrink sleeve/tubing, aramid yarn (such as Kevlar) bunches up or other fabrication anomalies require the opening to be increased. Applicability: Only if the specific design of polishing puck includes a collar or other restriction.		
Diameter of the polishing puck	Polishing puck diameter between 1.5 to 2.0 inches. Guidance: The smaller the ferrule diameter, the larger should be the polishing puck diameter.		
Hole tolerance	A tight fit of the ferrule in the polishing puck cavity. Guidance: A tolerance of $\pm .001$ inch hole diameter is acceptable. 3/		
Grip	Able to grip easily both the single ferrule connector/terminus barrel (body) and the polishing puck interface (such as a collar). 2/		
Applied weight	Initial: Polishing puck shall be designed to glide easily when an applied weight (i.e., hand pressure) is placed on the polishing puck during the polishing process.		
Durability	Pass: Metal that is sufficiently durable to survive 500 polishes. Sufficiently durable: If acceptable material used (300 series stainless steel is acceptable) 3/		
Corrosion	Corrosion resistant (300 series stainless steel is acceptable). 3/		
Surface finish	.032 finish minimum (.064 finish preferred). 3/		
Markings	Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code		

1/ An APC polishing puck can be designed so that the bottom surface is not parallel with the polishing paper, leaving one side higher at an 8 degree angle. This design is found to make polishing a bit awkward compared to polishing with a "normal" polishing puck (such as a PC polishing puck). Users were not able to consecutively achieve polishing an 8 degree angle with this polishing puck design.

2/ A wider collar or neck on the polishing puck is found to make gripping the single ferrule connector/terminus and holding it in place from slight to moderately more difficult.

3/ Certifications required: material (verify hole tolerance, durability and corrosion), surface finish of polishing puck bottom (polishing) surface.

Standard Deviation <u>3/</u>					

1/ Polish types: PC, APC.

2/ If PC polished, then Pass \leq .003 inch. If APC polished, then Pass \leq .006 inch.

3/ Applies when ferrule end faces either are all PC polished or are all APC polished.

c. Excerpt from an evaluation sheet to illustrate polishing puck post 10 polishes inspection.

TABLE 6304 B-III Evaluation sheet for polishing puck post 10 polishes inspection.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
Interface with ferrule.	Ferrule inserted into, polished successfully, then removed from the polishing puck for 10 polishes with no binding or loosening (ferrule wobbling during polishing).		
Diameter of the polishing puck	Polishing puck is easy to maneuver. Guidance: The smaller the ferrule diameter, the larger should be the polishing puck diameter.		
Grip	Polishing puck is easy to maneuver. Connector/terminus does not move around during polishing (up/down and/or side-to-side).		
Durability	Pass: Metal that is sufficiently durable to survive 500 polishes. Sufficiently durable: Without showing any signs of wear and degradation in function after completion of 10 connector/terminus polishes.		
Other input on polishing puck performance

REQUIREMENT 6304

APPENDIX B

- d. Excerpt from an evaluation sheet to illustrate cable assembly post polishing visual and mechanical inspection.

TABLE 6304 B-IV Evaluation sheet for cable assembly post polishing visual and mechanical inspection.

If a failure is recorded, provide details on the extent of the failure observed (on bottom on data sheet).

1. Identification markings and color.

a. Markings.

Criteria: All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Pass_____ All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Fail_____ All markings are not present. Specify on data sheet.

_____ Height of markings is too small to read/distinguish characters. Specify on data sheet.

_____ Markings are insufficiently legible (legible is if each character can be easily identified, even if some of the print is faded or removed). Specify on data sheet.

_____ Markings are not permanent (permanent is if markings remain legible after completion of qualification test sequence). Specify on data sheet.

2. Workmanship, visual.

a. Finish imperfections.

Criteria: No peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

Pass_____ No finish imperfections observed that is detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail_____ Observed sufficient peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

b. Surface imperfections.

Criteria: No rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations.

Pass_____ No surface imperfections observed that are detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail_____ Observed sufficient rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations. Specify on data sheet.

REQUIREMENT 6305

FERRULE LENGTH GAUGE INTERFACE REQUIREMENTS
(FOR PROTRUSION LENGTH OF FERRULE END FACES)

1. Purpose. The interface requirements for a fiber optic ferrule length gauge are specified herein. Along with the ferrule end face geometry and ferrule end face visual inspection, the ferrule length is identified as one criterion for refurbishment of the ferrule end face. These interface requirements are applicable to the fiber optic termini (such as the MIL-PRF-29504/4, MIL-PRF-29504/5, MIL-PRF-29504/14, MIL-PRF-29504/15, MIL-PRF-29504/18 and MIL-PRF-29504/20 termini, the test probe used in MIL-DTL-38999 and the MIL-PRF-29504/21 test terminus used in MIL-PRF-28876 and, MIL-PRF-64266 multiple termini connectors) and are applicable for single ferrule connectors (such as the FC, LC, SC and ST connectors). The intent is to provide this tool from multiple sources of supply that gives the Fleet/Field maintainer the ability to measure ferrule protrusion length of a terminus or single ferrule connector from all qualified termini sources of supply. Different potential configurations exist; however, the interface dimensions of the plunger tip and gauge adapter must conform to those of the specific terminus or single ferrule connector and polish type (PC or APC polish). This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, item number. Item number 6203JA assigned to the ferrule length gauge is found in [Requirement 6203](#). For Navy Shipboard applications, approved ferrule length gauge are found in the Navy Shipboard Fiber Optic Recommended Tool List also.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Connector, fiber optic. A device that permits repeated mating and couples the optical power between two optical fibers or two groups of optical fibers. A fiber optic connector must maintain fiber alignment without significant loss of optical power.

3.2 Connector, LC. The Lampert connector or Lucent connector (LC) is a single ferrule connector with a 1.25 mm (.05 inch) ferrule diameter, a push-pull style attachment configuration to the mating an LC-to-LC adapter/patch panel or equipment interface port, and a butt-jointed connector design. The LC connector has a small form factor configuration that has the same footprint as a RJ-45 receptacle.

3.3 Ferrule length gauge. An instrument used to measure the protruding ferrule length from the barrel (body) of the fiber optic terminus or single ferrule connector to the ferrule end face.

3.4 Polish, angle physical contact (APC). Ferrule end face has an 8 degree pre-polish angle or is polished in a manner to obtain an 8 degree polish angle. The intent of this 8 degree angle is to further reduce back reflection from the mating surfaces.

3.5 Polish, physical contact (PC). Ferrule end face is polished in a manner so that the fibers are the first to make contact when connection surfaces are mated together.

3.6 Termini. A component used in a fiber optic, multiple termini, connection that is inserted into one of the insert cavity of a multiple termini connector and terminated onto the end of a simplex, fiber optic cable. Termini is the plural form for the word terminus.

3.7 Terminus. Singular form for the word termini.

3.8 Terminus, pin. The male configuration of a terminus that consists of a metal barrel (body) and a metal or ceramic ferrule.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

3.9 Terminus, socket. The female configuration of a terminus that consists of a metal barrel (body), a metal or ceramic ferrule and an alignment sleeve. The alignment sleeve attaches to the socket terminus ferrule. Fiber alignment occurs when the pin terminus slides into the alignment sleeve of the socket terminus.

3.10 Test probe. A single fiber MQJ that is configured with a connector at one end to mate with the test equipment and a connector referred to as "test probe" at the other end. The test probe is test connector that is used to test one terminus at a time within a MIL-DTL-38999 connector. This test probe is inserted into the cavity of a test probe adapter. The test probe adapter is mated to the MIL-DTL-38999 connector.

3.11 Test terminus. A single fiber MQJ that is configured with a connector at one end to mate with the test equipment and a connector referred to as "test terminus" at the other end. The test terminus is test connector that is used to test one terminus at a time within a MIL-PRF-64266 connector. This test terminus is inserted into the cavity of a test terminus adapter. The test terminus adapter is mated to the MIL-PRF-64266 connector.

4. Requirements. The dimensions and interface features of the fiber optic ferrule length gauge shall be standardized for commonality compliance across platforms to ensure the ability to measure the specified ferrule protrusion length from the barrel (body) of the terminus or single ferrule connector to the ferrule end face. Commonality compliance is that in which bounds or restricts the parts to those cited in this Standard Practice. Requirements for the ferrule length gauge shall comply with 4.1 through 4.6.

4.1 Configuration. Ferrule length gauge shall include a measurement device (such as a digital gauge), plungers for various connector/termini types and fixtures to interface measurement device with the various connector/termini types. One configuration is shown in figure 6305-1 to illustrate a ferrule length gauge consisting of a measurement device, plunger and fixture.

4.2 Measurement parameters. Ferrule length gauge shall meet the minimum specified requirements for the measurement parameters listed in 4.2.1 through 4.2.4.

4.2.1 Digital indication. Digital display with resolution to four decimal places (minimum).

4.2.2 Accuracy of digital indication: +/- 0.0001 inches minimum.

4.2.3 Repeatability of digital indication: +/- 0.0001 inches minimum.

4.2.4 Measurement range. Anticipated maximum of removed ferrule material does not exceed 0.1 inches.

4.3 Insert for different connector/termini types. . At a minimum, the inserts shall be included for the following connector/termini types: M29504/4, M29504/5, M29504/4 & MIL-PRF-29504/5 test probe, M29504/14, M29504/15, M29504/18 & MIL-PRF-29504/20, M29504/18 & MIL-PRF-29504/20 test terminus, ST, SC, LC.

4.3.1 Interface documents. For fiber optic termini, the applicable specification sheets include MIL-PRF-29504/4, MIL-PRF-29504/5, MIL-PRF-29504/14, MIL-PRF-29504/15, MIL-PRF-29504/18, MIL-PRF-29504/20 and MIL-PRF-29504/21. For single ferrule connectors, the applicable military specification is MIL-DTL-83522. Otherwise, interface document used for a single ferrule connector shall conform to the applicable TIA-604 fiber optic connector intermateability standard.

4.4 Physical requirements. Ferrule length gauge shall meet the physical requirements of 4.4.1 through 4.4.4.

4.4.1 Envelope dimension. The ferrule length gauge with maximum envelop dimensions of 6 inch by 4 inch by 2 inch shall accommodate, with an added plunger tip, a single ferrule connector or terminus

4.4.2 Grip. The ferrule length gauge shall be configured to grasp both the single ferrule connector/terminus barrel (body) and the fixture that holds the single ferrule connector/terminus.

4.4.3 Applied weight. The weight on the ferrule end face being measured from the ferrule length gauge plunger (insert) shall not exceed 5 lb.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

4.4.4 Plunger tip configuration. Plunger tips that make contact with the ferrule end face shall conform to the plunger and alignment sleeve dimensions in figure 6301-I of [Requirement 6301](#). No damage to the plunger tip, connector/terminus ferrule end face or optical fiber end face shall result from a plunger tip contact with the connector/terminus.

4.5 Material requirements. Ferrule length gauge shall meet the durability and corrosion requirements of 4.5.1 through [4.5.3](#).

4.5.1 Durability. Material used for the ferrule length gauge inserts shall be metal that is sufficiently durable to survive 1000 ferrule insertions and removals without showing any signs of damage, wear and degradation in function (such as metal particles or shavings).

4.5.2 Corrosion. Material used for the ferrule length gauge shall be corrosion resistant. If provided with a stainless steel tool tip (inserts), 303 stainless steel is acceptable.

4.5.3 Hardness. Plunger tip hardness shall be as applicable for the materials listed in 4.3.4a through d.

- a. Hardened to Rockwell 53-57 Condition C for M2 steel,
- b. Heat treated to Rockwell C38-42 for types 410 and 420 CRES,
- c. Heat treated to Rockwell C35-40 for type 416 CRES.
- d. Hardened to Rockwell 92+ A for tungsten carbide.

4.5.4 Surface finish. Surface finish shall be used as a means to minimize contamination at the plunger tip. The end face of the plunger tip (i.e., surface that makes contact with the ferrule end face being measured) shall have a surface finish of 4 micro-inches (rms height) or finer.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

FIGURE 6305 – 1. Ferrule length gauge dimensions and interface features.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

4.6 Calibration considerations. Ferrule length gauge shall include a measurement device such as a micrometer, vernier caliper, or height gage. Ferrule length gauge shall meet the calibration considerations listed in [4.6.1](#) and [4.6.2](#). Ferrule length gauge shall include a means to reset to zero.

4.6.1 Removal for calibration. Measurement device shall be removable from the ferrule length gauge fixture for calibration.

4.6.2 Measurement device interval. Calibration interval for the measurement device shall not be less than one year.

4.7 Markings. Terminus retention tool shall be marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code. Markings shall be of minimum readable height (able to read/distinguish characters), and of sufficient legibility (each character can be easily identified, even if some of the print is faded or removed) and permanency (if markings remain legible after completion of qualification test sequence).

5. Implementation. Unless otherwise specified by the applicable Platform Office, ferrule length gauge shall incorporate the interface dimensions in [figure 6305-1](#) and the interface requirements of [4.1](#) through [4.6](#). Verification of these requirements shall comply with 5.1 through 5.4.

5.1 Responsibility. Unless otherwise specified by the procuring activity, the supplier is responsible for the performance of all items contained herein with regard to the above requirements.

5.2 Performance verification. Dimensional data for polishing puck may be provided to demonstrate performance; however, the Procuring Activity reserves the right to perform any of the inspections specified to verify suitable end face geometry is being obtained. Unless otherwise specified, test samples shall be submitted to the designated Approving Activity (see appendix A) for approval.

5.2.1 Evaluation criteria. When the ferrule length gauge is evaluated by the Approving Activity, the evaluation criteria used shall include the criteria as found in [appendix A](#).

5.2.2 Evaluation sheets. When the ferrule length gauge is evaluated by the Approving Activity, the evaluation sheets used shall include the content as on the evaluation sheets in [appendix B](#).

5.3 Performance demonstration for correct protrusion length measurement. When specified, test data submitted shall include verification for demonstration of successful single ferrule connector or terminus ferrule length protruding from the barrel to the ferrule end face.

5.4 Restrictions. When specified or for shipboard applications test data shall include the ferrule length obtained.

6. Notes.

6.1 Intended use. On these platforms, the ferrule length gauge is intended to measurement the protruding ferrule length from a terminus used in a MIL-PRF-28876/MIL-DTL-38999/MIL-PRF-64266 multiple termini connector or a single ferrule connector that is a part of (1) cable harnesses, and (2) equipment (electronic module/package) such as a ATR, LRC, LRM, LRU or WRA with internal fiber optics.

6.2 Tool use. The ferrule length gage is to measure the ferrule protrusion length. The ferrule protrusion length is the linear distance from the front of the barrel (body portion of the connector/terminus that holds the ferrule) to the ferrule tip. For a PC polished ferrule, the ferrule tip is defined as the highest point on the domed end face of the ferrule in which contact is made with the ferrule length gauge plunger. For an APC polished ferrule, the ferrule tip is defined as the highest point of the angle on the end face of the ferrule. The ferrule length gauge plunger can be flat to make contact with the highest point on an APC polished ferrule.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

APPENDIX A

FERRULE LENGTH GAUGE EVALUATION CRITERIA

A.1 Intent. Verify that the ferrule length gauge meets criteria specified in Requirement 6305.

A.2. APPLICABLE DOCUMENTS

A.2.1 General. The documents listed in this section are specified in sections A.3, A.4, and A.5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements documents cited in sections A.3, A.4, and A.5 of this standard practice, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards and handbooks. The following specifications, standards and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-29504](#) - Termini, Fiber Optic Connector, Removable, General Specification for.
- [MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environmental Resisting, General Specification for.

GENERAL SERIES TECHNICAL MANUAL

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

Navy Recommended Fiber Optic Components Parts List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optic Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for tools and for test equipment) that may be applicable to the logistic support requirements for the specified component. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

A.3 Definitions.

A.3.1 Approving activity. Unless otherwise specified, Naval Surface Warfare Center Dahlgren Division (NSWC DD) is the approving activity for approval to use a ferrule length gauge as specified in Requirement 6305.

A.3.2 Requesting party. Activity or vendor requests approval. Process begins by providing a ferrule length gauge (with specified certifications and cable assembly pigtail samples), being evaluated, and if in compliance, being placed on the Navy Shipboard Fiber Optic Recommended Tool List and into [MIL-STD-1678-6](#). Consideration for approval is based on demonstrating compliance as specified in Requirement 6305.

A.4 Requirements.

A.4.1 Evaluation criteria. Ferrule length gauge shall meet the criteria in [TABLE 6305 A-I](#). The evaluation process, including the requesting party's submissions, shall be performed in accordance with the steps listed in [TABLE 6305 A- II](#).

A.4.2 Certifications.

A.4.2.1 Certifications with initial submission. Certifications shall be submitted for ferrule length gauge material (to verify durability and corrosion).

A.4.2.2 Modifications and replacements. Once evaluated and approved, the approving activity shall be notified in writing or by e-mail of any modifications or substitutions made to the ferrule length gauge. Details of the modification or substitution shall be provided for the approving activity's determination if any or all portions of the evaluation need to be redone. Details should include any certifications and other documentation needed to make this determination.

A.4.3 Terminated cable assemblies

A.4.3.1 Test sample configuration (terminated cable assembly pigtails). Terminated cable assembly pigtails shall be included as part of the submission. Specific termini cable assembly pigtails shall conform to [TABLE 6305-III](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

APPENDIX A

A.4.3.2 Applicable connector/terminus types. Terminated cable assembly pigtails (in [TABLE 6305-III](#)) may be tailored by the approving activity depending upon the connector/terminus types to be covered under the plunger tips, gauge adapter (alignment collar), or both for the ferrule length gauge submitted for approval.

A.4.3.3 Termination. Termination of the connector/terminus onto the cable assembly pigtail shall be performed in accordance with MIL-STD-2042. When specified, these terminations, including polishing, shall be in accordance with [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#).

TABLE 6305 A-I Evaluation table for ferrule length gauge.

Parameter	Pass Criteria	Requirement	
Configuration	Initial: Tool features shall include: measurement device (such as a digital gauge), plungers (if separate from measuring device), and gauge adapters for each specified terminus/connector type.	4.1	
Digital measurement parameters.	Initial: Digital indication having a: Digital display with minimum 4 decimal place resolution. Accuracy of ± 0.0001 inches minimum. Repeatability of ± 0.0001 inches minimum. Range of ± 0.1 inches minimum.	4.2	
Gauge adapters for connector/terminus types.	Initial: M29504/4, M29504/5, M29504/4 & MIL-PRF-29504/5 test probe, M29504/14, M29504/15, M29504/18 & M29504/20, M29504/18 & M29504/20 test terminus, ST, SC, LC	4.3	
Envelope dimension.	Initial: Maximum envelop dimensions of 6 inch by 4 inch by 2 inch that does not include an added plunger tip, a single ferrule connector or terminus.	4.4.1	
Grip	Initial: Configured to grasp both the single ferrule connector/terminus barrel (body) and the fixture that holds the single ferrule connector/terminus	4.4.2	
Applied weight	Initial: Applied weight (hand pressure and connector/terminus) on the ferrule end face being measured from the ferrule length gauge plunger (insert) shall not exceed 5 b.	4.4.3	
Durability	Pass: Metal that is sufficiently durable to survive 1000 ferrule insertions and removals. Sufficiently durable: Initial - If acceptable material used (303 stainless steel is acceptable) 1/ Post 140 insertion and removal cycles - Without showing any signs of wear and degradation in function during and after completion of 140 insertion and removal cycles. 1/	4.5.1	
Corrosion	Initial: Corrosion resistant (303 stainless steel is acceptable). 1/	4.5.2	
Hardness	Initial: 1/	4.5.3	
Plunger tip geometry	Initial: Flat to make contact with highest point on the domed end face of the PC polished ferrule and the highest point on an APC polished ferrule.	4.4.4, 6.2	
Calibration	Initial: Measurement device removable, measurement device calibration interval not less than one year, measurement device has a means to reset to zero.	4.6	
Markings	Initial: Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code Post 100 removal cycles: easily identifiable, legibility and permanency	4.7	

See footnote at end of table.

REQUIREMENT 6305

APPENDIX A

TABLE 6305 A-I Evaluation table for ferrule length gauge – continued.

Parameter	Pass Criteria	Requirement	
Visual end face inspection	Pre-testing and measurement: MIL-STD-1678-5 Measurement 5202 with note 4/ of TABLE 6305 A-II . Digital image of each ferrule end face shall be stored for later comparison with the post testing and measurements visual end face inspection.	A.5.1.2	
140 insertion and removal cycles	Perform 10 insertions and removals with each type connector/terminus specified in 4.3 and TABLE 6305 A-III as a measure of tool durability. This test may be performed in conjunction with the Ferrule length measurement.	4.5.1, A.5.1.3.a	
Ferrule length measurement	Perform 10 ferrule length measurements with each type connector/terminus specified in 4.3. Measurement shall be performed as specified in A.5.1.3.b. Measurement shall be accurate to within $\pm .001$ inches of the known ferrule protrusion length.	MIL-STD-1678-6 Measurement 6305, A.5.1.3.b	
Visual end face inspection	Post testing and measurement: Performed using a fiber optic video inspection system that complies with MIL-STD-1678-5 Requirement 5202. Digital image of each ferrule end face shall be obtained and compared with the pre-testing and measurements visual end face inspection. Pass: No additional defects or scratches shall be observed on the ferrule end face as a result of performing a retention clip seating test on each terminus.	A.5.3	
Post-measurement visual and mechanical inspection	Workmanship: finish, surface, and part imperfections; matability with terminus/connector Markings: easily identifiable, legibility and permanency	MIL-STD-1678-3 Measurements 3103, 3104	

1/ Certifications required: material (verify durability and corrosion).

1/ Cable assembly pigtail minimum length is 12 inch from ferrule tip (end face) to the end of the cable. One cable assembly pigtail from each row. Another option allowed is to put one terminus/connector on each end of the fiber optic cable rather than having a separate pigtail for each.

2/ MM = Multimode, SM = Single Mode.

3/ Standard PC polish is the standard procedure for the domed end face polish in MIL-STD-2042.

4/ APC polish is the angled end face polish in MIL-STD-2042.

5/ Cable assembly pigtail shall be constructed with MIL-PRF-85045/16-01 multimode cable.

6/ Cable assembly pigtail shall be constructed with MIL-PRF-85045/16-02 single mode cable.

7/ Delphi or other QPL source with a narrow pedestal ferrule end face.

8/ AFSI or other QPL source with a broad pedestal ferrule end face.

A.5. Verification. Verification shall consist of the evaluation performed by the requesting party and by the approving activity as listed in [TABLE 6305 A-I](#) using the step specified in [TABLE 6305 A-II](#) and as further detailed in A.5.1 through A.5.4.

A.5.1 Evaluation. The evaluation shall include the inspections and measurements in A.5.1.1 through A.5.1.4.

A.5.1.1 Ferrule length guage initial inspections. During the ferrule length gauge initial inspections, the ferrule length gauge performance shall be rated as listed in A.5.1.1.a through I.

- a. Configuration.
- b. Digital measurement parameters.
- c. Gauge adapters for connector/terminus types.
- d. Envelope dimension.
- e. Grip.
- f. Applied weight.
- g. Durability.
- h. Corrosion.
- i. Hardness.
- j. Plunger tip geometry.
- k. Calibration.
- l. Markings.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

APPENDIX A

A.5.1.2 Pre-testing and measurements visual end face inspection. Visual end face inspection shall be performed in accordance with MIL-STD-1678-3 Measurement 3101 with note 4/ of [TABLE 6305 A-II](#) Digital image of each ferrule end face shall be stored for later comparison with the post testing and measurements visual end face inspection.

A.5.1.3 Testing and measurements. The durability test and ferrule protrusion measurements shall be performed with the cable assembly pigtails as specified in [TABLE 6305 A-III](#).

- a. 140 insertion and removal cycles shall be performed. Each of the 14 single ferrule connectors and termini in [TABLE 6305 A-III](#) (as part of the cable assembly submission) shall be inserted and removed from the ferrule length gauge 10 times. If all 14 single ferrule connectors and termini on cable assembly pigtails as specified in [TABLE 6305 A-III](#) are not being evaluated, then each cable assembly pigtail being evaluated shall be inserted and removed from the ferrule length gauge 10 times.
- b. The ferrule protrusion length shall be measured in accordance with A.5.2. Each of the 14 single ferrule connectors and termini in [TABLE 6305 A-III](#) (as part of the cable assembly pigtail submission) shall be measured 10 times. The ferrule length gauge shall be reset to zero after each measurement. If all 14 single ferrule connectors and termini on cable assembly pigtails as specified in [TABLE 6305 A-III](#) are not being evaluated, then each cable assembly pigtail being evaluated shall be measured 10 times.

A.5.1.4 Post testing and measurements inspections. After the testing and measurements for the ferrule length gauge are performed for the 15 test sample ends of each cable assembly, each evaluator shall rate ferrule length gauge performance as listed in 5.1.3.a through d.

- a. Durability.
- b. Visual end face inspection (see A.5.3).
- c. Visual and mechanical inspection (see A.5.4).
- d. Other input on ferrule length gauge performance.

A.5.2 Ferrule protrusion length. Measurement shall be performed using a tool that complies with MIL-STD-1678-6 Requirement 6305. Measurement of the ferrule protrusion length shall consist of the length as specified in 6.2 of MIL-STD-1678-6 Requirement 6305.

A.5.3 Visual end face inspection. Measurement shall be performed using a fiber optic video inspection system that complies with MIL-STD-1678-5 Requirement 5202. Digital image of each ferrule end face shall be obtained and compared with the pre-testing and measurements visual end face inspection. No additional defects or scratches shall be observed on the ferrule end face as a result of performing a ferrule length gauge measurement on the connector/terminus.

A.5.4 Visual and mechanical inspection. Inspections shall be performed in accordance with MIL-STD-1678-3 Measurement 3105 with note 4/ of [TABLE 6305 A-II](#).

A.5.5 Evaluation package. An evaluation package shall be prepared for each ferrule length gauge. The evaluation package shall include the documentation listed in A.5.4.a through c.

- a. Evaluation sheets for initial and post measurement inspections, durability testing and ferrule protrusion measurements, and post polishing measurements. Evaluation sheets used shall include the content as on the evaluation sheets in [appendix B](#).
- b. Data sheet information as specified in 4.2 and applicable items in TABLE 2201 A-I of MIL-STD-1678-2 Measurement 2201. This information may appear on a separate General Data Sheet (cover sheet) or incorporated into the evaluation sheet.
- c. Summary sheet with summary or TABLE of inspections and measurements, the result (findings) of each, approval or recommended corrective actions, other pertinent input, signature or initials of reviewer or authority at approving activity. Summary sheet may be first page of the evaluation package.

A.6. Notes.

A.6.1 Intents behind standardization efforts.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

APPENDIX A

A.6.1.1 Multiple party testing considerations. The incentive to minimize test variables, resulting in a level playing field for multiple parties testing, leads the Government to establish a baseline. This baseline includes considerations for fabrication of test samples, methods to verify actions/measurements and use of specific test practices in addition to specifics for test sample configurations.

MIL-STD-1678-6A

REQUIREMENT 6305

APPENDIX B

FERRULE LENGTH GAUGE EVALUATION SHEETS

B.1 Excerpt from evaluation sheets to illustrate (1) ferrule length gauge initial inspections, (2) Durability testing and ferrule protrusion length measurements, and (3) Post measurements inspections. Criteria listed in the evaluation sheets is taken from [TABLE 6305 A- I](#).

a. Excerpt from an evaluation sheet to illustrate the ferrule length gauge initial inspections.

TABLE 6305 B-I Evaluation sheet for ferrule length gauge initial inspection.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
Configuration	Tool features shall include: measurement device (such as a digital gauge), plungers (if separate from measuring device), and gauge adapters for each specified terminus/connector type.		
Digital measurement parameters.	Digital indication having a: Digital display with minimum 4 decimal place resolution. Accuracy of ± 0.0001 inches minimum. Repeatability of ± 0.0001 inches minimum. Range of ± 0.1 inches minimum.		
Gauge adapters for connector/terminus types.	M29504/4, M29504/5, M29504/4 & M29504/5 test probe, M29504/14, M29504/15, M29504/18 & M9504/20, M29504/18 & MIL-PRF-29504/20 test terminus, ST, SC, LC		
Envelope dimension.	Maximum envelop dimensions of 6 inch by 4 inch by 2 inch that does not include an added plunger tip, a single ferrule connector or terminus.		
Grip	Configured to grasp both the single ferrule connector/terminus barrel (body) and the fixture that holds the single ferrule connector/terminus		
Applied weight	Applied weight (hand pressure and connector/terminus) on the ferrule end face being measured from the ferrule length gauge plunger (insert) shall not exceed 5 b.		
Durability	Metal that is sufficiently durable to survive 1000 ferrule insertions and removals. Sufficiently durable: Initial - If acceptable material used (303 stainless steel is acceptable) <u>1/</u>		
Corrosion	Corrosion resistant (303 stainless steel is acceptable). <u>1/</u>		
Hardness	<u>1/</u>		
Plunger tip geometry	Flat to make contact with highest point on the domed end face of the PC polished ferrule and the highest point on an APC polished ferrule.		
Calibration	Measurement device removable, measurement device calibration interval not less than one year, measurement device has a means to reset to zero.		
Markings	Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code		
<u>1/</u> Certifications required: material (verify durability and corrosion).

REQUIREMENT 6305

APPENDIX B

TABLE 6305 B-IV Evaluation sheet for ferrule length gauge visual and mechanical inspection.

If a failure is recorded, provide details on the extent of the failure observed (on bottom on data sheet).

1. Identification markings and color.a. Markings.

Criteria: All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Pass_____ All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Fail_____ All markings are not present. Specify on data sheet.

_____ Height of markings is too small to read/distinguish characters. Specify on data sheet.

_____ Markings are insufficiently legible (legible is if each character can be easily identified, even if some of the print is faded or removed). Specify on data sheet.

_____ Markings are not permanent (permanent is if markings remain legible after completion of qualification test sequence). Specify on data sheet.

2. Workmanship, visual.a. Finish imperfections.

Criteria: No peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

Pass_____ No finish imperfections observed that is detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail_____ Observed sufficient peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

b. Surface imperfections.

Criteria: No rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations.

Pass_____ No surface imperfections observed that are detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail_____ Observed sufficient rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations. Specify on data sheet.

c. Part imperfections.

Criteria: Product/parts are dimensionally uniform, free of lumps, kinks, splits, scraped or abraded surfaces, inclusions or other imperfections.

Pass_____ No part imperfections observed that are detrimental to form, fit or function or that could result in further protective material or function degradation

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6305

APPENDIX B

Fail_____ Observed product/parts are not dimensionally uniform, free of lumps, kinks, splits, scraped or abraded surfaces, inclusions or other imperfections. Specify on data sheet.

d. Mateability.

Criteria: Connectors, adapters, and other interconnecting devices (mateable items) mate and unmate easily and make proper connection.

Pass_____ No mateability or other mechanical interconnects observed that are detrimental to form, fit or function or that could result in preventing mating.

Fail_____ Connectors, adapters, and other interconnecting devices (mateable items) do not mate and unmate easily or do not make the proper connection. Specify on data sheet.

_____ Mateable items will not mate. Specify on data sheet.

_____ Mateable items were damaged during mating. Specify on data sheet.

_____ Mateable items did not make proper connection. Specify on data sheet.

e. Inner part imperfections.

Criteria: Inner parts contain no fractures, holes, discontinuities, bulges, thin spots or other imperfections.

Pass_____ No inner part imperfections observed that are detrimental to form, fit or function or that could result in further material or function degradation

Fail_____ Observed inner parts contain fractures, holes, discontinuities, bulges, thin spots or other imperfections. Specify on data sheet.

f. Functionality.

Criteria: Mechanical mechanisms function properly. Spring and latch mechanisms do not interfere with other components (cable fit into connector). Knobs, button, and threaded components operate properly.

Pass_____ No mechanical mechanism malfunction observed that are detrimental to form, fit or function or that could result in further material or function degradation.

Fail_____ Spring and latch mechanisms will interfere with other components (cable fit into connector). Specify on data sheet.

_____ Knobs, button, and threaded components do not operate properly. Specify on data sheet.

Details on failures recorded:

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6306

ADAPTER (HOLDING) TOOL INTERFACE REQUIREMENTS
(FOR MIL-PRF-64266 CONNECTOR)

1. Purpose. The interface requirements for a fiber optic adapter (holding) tool are specified herein. These interface requirements are applicable to the MIL-PRF-64266 connector. The intent is to provide an adapter tool from multiple sources of supply that gives the Fleet/Field maintainer the ability to tighten the backshell onto the connector from all qualified termini sources of supply. Different adapter tool configurations may exist; however, the interface dimensions of the adapter tool must conform to the polarization keys (master primary polarizing key, master secondary polarizing key, and clocking key) configuration on the MIL-PRF-64266 connector. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental configurations. The MIL-PRF-64266 adapter tools are configured so that one adapter tool can be used for the 8 keying (clocking) positions for a shell size 11 connector and for the 12 clocking positions for shell sizes 13, 15 and 23 connectors. These interface dimensions are the ones cited in this requirement and are the ones that must be considered in the keyway design of an adapter tool for a MIL-PRF-64266 connector plug and in the key design of an adapter tool for a MIL-PRF-64266 connector receptacle. These requirements for the keying function are cited in 4.1.

1.2 Supplemental, item number. Item number assigned to the MIL-PRF-64266 adapter tools are 6206GA through 6206GD (see [Requirement 6206](#)). For Navy Shipboard applications, approved adapter tools are found in the Navy Shipboard Fiber Optic Recommended Tool List also.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for

DEPARTMENT OF DEFENSE STANDARD

- [MIL-STD-2042](#) - Fiber Optic Cable Topology Installation, Standard Methods for Naval Ships
- [MIL-STD-2042-5](#) - Fiber Optic Cable Topology Installation Standard Methods for Naval Ships (Connectors and Interconnections) (Part 5 of 7 Parts)

REQUIREMENT 6306

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/T.O. 1-1A-14/TM 1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Adapter tool. A tool used to hold the connector while tightening the backshell onto the connector.

3.2 Holding tool. An alternate term for an adapter tool. This term is more descriptive of the tool's function.

4. Requirements. The keying configuration of the fiber optic adapter tool shall be standardized for commonality compliance across platforms to ensure the ability to hold the MIL-PRF-64266 multiple termini connector while tightening the backshell onto the connector. Commonality compliance is that in which bounds or restricts the assembly of parts using the adapter tool to those procedures cited in [MIL-STD-2042-5](#), cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and cited in this Standard Practice. Requirements for the adapter tool interface with the MIL-PRF-64266 multiple termini connector shall comply with 4.1 through 4.4.

4.1 Function. The function of the adapter tool shall be to fit into the cylindrical keying surface of the MIL-PRF-64266 multiple termini connector. No damage to the adapter tool or fiber optic connector shall result from inserting an adapter tool onto the connector or transmitting the specified applied torque from the backshell, through the connector and adapter tool, to the torque wrench affixed to the adapter tool.

4.2 Dimensional requirements.

4.2.1 Interface with connector front end. The dimensions for the adapter tool that interfaces with (allows entry into) the front end of the connector shall be designed to conform to figure A-1 of MIL-PRF-64266 for a connector plug and with figure A-2 of MIL-PRF-64266 for a connector receptacle. Unless otherwise specified, the surfaces along the length of the tool shall be round.

4.2.2 Interface with mating keys and keyways. The dimensions for the adapter tool that interfaces with the mating keys on a connector plug and the mating keyways on a connector receptacle shall be designed to conform to figure A-3 of MIL-PRF-64266. One adapter tool shall be provided for each shell size connector plug and each shell size connector receptacle.

4.2.2.1 Number and types of keyways in adapter tools for connector plugs. For each shell size connector plug; the adapter tool shall be designed to have the mating master primary polarizing keyway, the master secondary polarizing keyway and all 8 clocking keyways for shell size 11 and all 12 clocking keyways for shell sizes 13, 15 and 23.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6306

4.2.2.2 Number and types of keys in adapter tools for connector receptacles. For each shell size connector receptacle; the adapter tool shall be designed to have the mating master primary polarizing key and the master secondary polarizing key at a minimum. The preference is for the adapter tool to contain all 8 clocking keys for shell size 11 and all 12 clocking keys for shell sizes 13, 15 and 23 also.

4.2.3 Interface with torque wrench. The adapter tool surface that interfaces with a torque wrench or other holding/tightening tool shall include a hole in the center of the surface to interface with a square drive. A hole for a 1/4 inch square drive shall be placed in the center of the surface for shell sizes 11, 13 and 15 adapter tools. A hole for a 3/8 inch square drive shall be placed in the center of the surface for a shell size 23 adapter tool.

4.2.4 Envelop dimensions. Envelop dimensions for tool placement into a pocket or storage space in a MIL-PRF-64266 connector assembly tool kit shall be as specified in [TABLE 6306-I](#).

4.3 Materials. The adapter tool material shall meet the durability, corrosion and applied torque requirements of [4.3.1](#) through [4.3.3](#).

4.3.1 Durability. Material used for the adapter tool shall be durable to survive 500 placements onto the connector, receiving the specified torque value being transmitted from the backshell, and removed from the connector without showing any signs of wear and degradation in function.

4.3.2 Corrosion. Material used for the tool shall be corrosion resistant. If provided material is stainless steel, 300 or 400 series stainless steel is acceptable. If provided material is aluminum, then 2000 series aluminum with an anodized finish is acceptable. If provided material is steel, then 1000 series carbon steel with a black oxide finish is acceptable.

4.3.3 Applied torque. See 4.4.

4.4 Applied torque. The adapter tool shall be able to withstand the applied torque that is specified in table 5A5-V of [MIL-STD-2042-5](#) or table 6 in Work Package 011 03 of [NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#).

4.5 Markings. Adapter tool shall be marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code. Markings shall be of minimum readable height (able to read/distinguish characters), and of sufficient legibility (each character can be easily identified, even if some of the print is faded or removed) and permanency (if markings remain legible after completion of qualification test sequence).

4.5.1 Marking master primary polarizing key/keyway. A white dot shall be marked on the outside surface at the position (located radially and along the length) for the master primary polarizing key or keyway.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6306

TABLE 6306-I. Adapter tool nominal envelop dimensions.

Adapter Tool for Connector Type	Shell Size	Envelop Diameter		Envelop Length	
		(inch)	(mm)	(inch)	(mm)
Connector plug	11	0.885	22.48	1.51	38.35
Connector receptacle	11	0.885	22.48	1.51	38.35
Connector plug	13	1.01	25.65	1.51	38.35

Connector receptacle	23	1.635	41.53	1.51	38.35

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic adapter tool shall incorporate the interface dimensional requirements of 4.1 through 4.5. Verification of these requirements shall comply with 5.1 through 5.3.

5.1 Responsibility. Unless otherwise specified by the procuring activity, the supplier is responsible for the performance of all items contained herein with regard to the above requirements.

5.2 Performance verification. Dimensional data for the adapter and test data for the applied torque may be provided to demonstrate performance; however, the Procuring Activity reserves the right to perform any of the inspections specified. When specified, test samples shall be submitted to the designated Approving Activity (see [appendix A](#)) for approval.

5.2.1 Evaluation criteria. When the adapter tool is evaluated by the Approving Activity, then the evaluation criteria used shall include the criteria as found in [appendix A](#).

5.2.2 Evaluation sheets. When the adapter tool is evaluated by the Approving Activity, then the evaluation sheets used shall include the content as on the evaluation sheets in [appendix B](#).

5.3 Performance demonstration with fully populated connectors. When specified, test data submitted shall include verification for demonstration of successful tightening of the backshell onto the connector using the adapter tool in each shell size connector. As an alternative, affixing the connector and applying a torque onto the mating adapter tool may be specified instead.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic adapter tool are used to affix a backshell onto a MIL-PRF-64266 multiple termini connector, as part of (1) cable harnesses, and (2) equipment (electronic module/package) such as a ATR, LRC, LRM, LRU or WRA with internal fiber optics.

REQUIREMENT 6306

APPENDIX A

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

Navy Recommended Fiber Optic Components Parts List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optic Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for tools and for test equipment) that may be applicable to the logistic support requirements for the specified component. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

A.3 Definitions.

A.3.1 Approving activity. Unless otherwise specified, Naval Surface Warfare Center Dahlgren Division (NSWC DD) is the approving activity for approval to use an adapter tool as specified in Requirement 6306.

A.3.2 Requesting party. Activity or vendor requests approval. Process begins by providing an adapter tool (with specified certifications), being evaluated, and if in compliance, being placed on the Navy Shipboard Fiber Optic Recommended Tool List and into MIL-STD-1678-6. Consideration for approval is based on demonstrating compliance as specified in Requirement 6306.

A.4 Requirements.

A.4.1 Evaluation criteria. The adapter tool shall meet the criteria in [TABLE 6306 A- I](#). The evaluation process, including the requesting party's submissions, shall be performed in accordance with the steps listed in [TABLE 6306 A- II](#).

A.4.2 Certifications.

A.4.2.1 Certifications with initial submission. Certifications shall be submitted for adapter tool material (to verify durability and corrosion) and to certify compliance to the adapter tool interface dimensioning as specified in 4.2.

A.4.2.2 Modifications and replacements. Once evaluated and approved, the approving activity shall be notified in writing or by e-mail of any modifications or substitutions made to the adapter tool. Details of the modification or substitution shall be provided for the approving activity's determination if any or all portions of the evaluation need to be redone. Details should include any certifications and other documentation needed to make this determination.

A.4.3 Interfacing connectors

A.4.3.1 MIL-PRF-64266 connectors. When specified, connector plugs and connector receptacles for shell sizes 11, 13, 15 and 23 shall be included as part of the submission. Specific configurations for connector plugs and connector receptacles shall conform to [TABLE 6306 A-III](#).

A.4.3.2 Applicable connector types. Connectors (in [TABLE 6306 A-III](#)) may be tailored by the approving activity depending upon the variants of the adapter tool submitted for approval.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6306

APPENDIX A

TABLE 6306 A-I Evaluation table for adapter tool.

Parameter	Pass Criteria	Requirement	
Function	Initial: Adapter tool shall fit into the cylindrical keying surface of the MIL-PRF-64266 multiple termini connector. Initial: No damage to the adapter tool or fiber optic connector shall result from placing or removing the adapter tool onto the connector. Post applied torque: No damage to the adapter tool or fiber optic connector shall result from placing the adapter tool onto the connector, removal of the adapter tool and either transmitting the specified applied torque from the backshell, through the connector and adapter tool, to the torque wrench affixed to the adapter tool or directly from the torque wrench to the adapter tool.	4.1	
Dimensional interface with front end.	Initial: Dimensions for the adapter tool that interfaces with (allows entry into) the front end of the connector shall be designed to conform to figure A-1 of MIL-PRF-64266 for a connector plug and with figure A-2 of MIL-PRF-64266 for a connector receptacle. 1/ Initial: The surfaces along the length of the tool shall be round.	4.2.1	
Dimensional interface with mating keys and keyways	Initial: Dimensions for the adapter tool that interfaces with the mating keys on a connector plug and the mating keyways on a connector receptacle shall be designed to conform to figure A-3 of MIL-PRF-64266 . 1/ Initial: One adapter tool shall be provided for each shell size connector plug and each shell size connector receptacle.	4.2.2	
Number and types of keyways in adapter tools for connector plugs	Initial: Adapter tool shall be designed to have the mating master primary polarizing keyway, the master secondary polarizing keyway and all 8 clocking keyways for shell size 11 and all 12 clocking keyways for shell sizes 13, 15 and 23.	4.2.2.1	
Number and types of keys in adapter tool for connector receptacles	Initial: Adapter tool shall be designed to have the mating master primary polarizing key and the master secondary polarizing key at a minimum. Note: The preference is for the adapter tool to contain all 8 clocking keys for shell size 11 and all 12 clocking keys for shell sizes 13, 15 and 23 also.	4.2.2.2	
Dimensional interface with torque wrench	Initial: Adapter tool surface that interfaces with a torque wrench or other holding/tightening tool shall include a hole in the center of the surface to interface with a square drive. A hole for a 1/4 inch square drive shall be placed in the center of the surface for shell sizes 11, 13 and 15 adapter tools. A hole for a 3/8 inch square drive shall be placed in the center of the surface for a shell size 23 adapter tool.	4.2.3	
Envelop dimensions	Initial: Envelop dimensions shall be as specified in TABLE 6306-I	4.2.4	

See footnotes at end of table

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6306

APPENDIX A

TABLE 6302 A-I Evaluation table for adapter tool – continued.

Parameter	Pass Criteria	Requirement	
Durability	Initial: Material used for the adapter tool shall be durable to survive 500 placements onto the connector, applied torque, and removals. Post applied torque: Adapter tool placement onto the connector, receiving the specified torque value being transmitted from the backshell, and removal from the connector without showing any signs of wear and degradation in function. Sufficiently durable: Initial - If acceptable material used (300 or 400 series stainless steel, 2000 series aluminum with anodized finish, 1000 series carbon steel with a black oxide finish are acceptable) and withstands applied load with no evidence of breakage, cracking, chipping or other damage that would impair adapter tool function. <u>1/</u> Post applied torque - Without showing any signs of wear and degradation in function during and after completion of applied torque.	4.3.1	
Corrosion	Initial: Material is sufficiently corrosion resistant (300 or 400 series stainless steel is acceptable. Also, aluminum with an anodized finish.). <u>2/</u>	4.3.2	
Markings	Initial: Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code Post applied torque: easily identifiable, legibility and permanency. White dot is present and positioned at centerline of key/keyway.	4.5	
Applied torque: assembly procedure	Perform part of backshell assembly procedure to MIL-STD-2042 or NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4 . <u>3/</u>	A.5.1.2.1	
Applied torque: 100 cycles	Perform 100 cycles of placing adapter tool onto the connector, applying the specified torque (see 4.4) to the adapter tool for 2 seconds, and removing the adapter tool from the connector. <u>4/</u> Perform post applied torque 100 cycles inspections for Function, Durability.	A.5.1.2.2	
Post applied torque inspections	Perform post applied torque 100 cycles inspections for Function, Durability, Other input of adapter tool performance.	4.1, 4.3.1	
Post applied torque visual and mechanical inspections	Workmanship: finish, surface, and part imperfections; mateability with connector Markings: easily identifiable, legibility and permanency	MIL-STD-1678-3 Measurements 3103, 3104	

1/ Certifications required: material to verify durability and corrosion, dimensional to verify interfaces with connector front end, mating keys and keyways, number and types of keyways (adapter tools for connector plugs) and keys (adapter tools for connector receptacles), and torque wrench.

2/ Certification provided that the terminus removal tool meets the MIL-STD-1678-3 Measurement 3401 requirement for a 48 hour salt spray test (equivalent to MIL-STD-202 Method 101). Certification shall include that testing was performed on adapter tool under evaluation or a tool/component with the same material(s).

3/ Perform in accordance with Method 5A5 paragraphs 4.2.8 and 4.2.9 of MIL-STD-2042. When specified, the procedure shall be in accordance with Work package 011 03 paragraph 5i of [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#). When specified, the placement of the adapter tool onto the connector, the torque applied directly onto the adapter tool, then the removal of the adapter tool from the connector may be performed using only an affixed connector (i.e., a connector held securely in a fixture), adapter tool and torque wrench.

4/ The connector shall be placed in a fixture or other means used to secure the connector in place. The adapter tool shall be placed onto the connector, the specified torque (see 4.4) applied to the adapter tool for 2 seconds, and the adapter tool removed from the connector. This sequence of three steps is one cycle. This sequence (for the applied torque) shall be performed for 100 cycles.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6306

APPENDIX A

TABLE 6306 A-II. Actions (steps) required for adapter tool approval process.

Step	Action	Submits <u>1/</u>	Receives <u>1/</u>	Addendum
1	Submits request, including required certifications, adapter tool, and, when specified, MIL-PRF-64266 connector (both plugs and receptacles)	Requesting Party	Approving Activity	<u>2/</u>
2	Performs adapter tool initial inspections in TABLE 6306 A-I up to applied torque.	Approving Activity	See step 5	<u>3/</u>
3	Performs applied torque, both assembly procedure and 100 cycles in accordance with notes <u>3/</u> and <u>4/</u> in TABLE 6306 A-I	Approving Activity	See step 5	
4	Performs post applied torque inspections:			
4a	Performs post applied torque 100 cycles Function, Durability	Approving Activity	See step 5	<u>3/</u>
4b	Performs visual and mechanical inspection	Approving Activity	See step 5	<u>4/</u>
5	Provides results and decision on approval of adapter tool	Approving Activity	Requesting Party	

Notes:

1/ See A.3.1 and A.3.2.2/ Each terminated cable assembly pigtail shall be provided with a unique identification marking.3/ Criteria: See [TABLE 6306 A-I](#).4/ Perform in accordance with (IAW) criteria specified in [TABLE 6306 A-I](#) supplemented by MIL-STD-2042, and by MIL-STD-1678 measurement 5202.TABLE 6306 A-III. Connector configurations for submission.

Connector Type	Shell Size	Number of Cavities in Connector Insert <u>1/</u>	Material	Shell polarizing key/keyway position	Quantity to Submit
Connector plug	11	4	D <u>2/</u>	<u>3/</u>	1
Connector receptacle	11	4	D <u>2/</u>	<u>3/</u>	1
Connector plug	13	4	D <u>2/</u>	<u>3/</u>	1
Connector receptacle	13	4	D <u>2/</u>	<u>3/</u>	1
Connector plug	15	8	D <u>2/</u>	<u>3/</u>	1
Connector receptacle	15	8	D <u>2/</u>	<u>3/</u>	1
Connector plug	23	36	D <u>2/</u>	<u>3/</u>	1
Connector receptacle	23	36	D <u>2/</u>	<u>3/</u>	1

1/ Number of cavities in the insert.2/ D = Aluminum with non-conductive finish.3/ Position 1 for clocking key/keyway is preferred, other clocking key/keyway positions are acceptable.

A.5. Verification. Verification shall consist of the evaluation performed by the requesting party and by the approving activity as listed in [TABLE 6306 A-I](#) using the step specified in [TABLE 6306 A-II](#) and as further detailed in A.5.1.

A.5.1 Evaluation. The evaluation shall include the inspections and measurements in A.5.1.1 through A.5.1.3.

A.5.1.1 Adapter tool initial inspections. During the adapter tool initial inspections, adapter tool performance shall be rated for the parameters as listed in A.5.1.1.a through j.

- a. Function.
- b. Dimensional interface with front end.
- c. Dimensional interface with mating keys and keyways.
- d. Number and types of keyways in adapter tools for connector plugs.
- e. Number and types of keys in adapter tool for connector receptacles.
- f. Dimensional interface with torque wrench.
- g. Envelop dimensions
- h. Durability.
- i. Corrosion.
- j. Markings.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6306

APPENDIX A

A.5.1.2 Applied torque.

A.5.1.2.1 Applied torque: Assembly procedure. Placement of the adapter tool onto the connector, procedure for placement of the backshell onto the connector (including the applied torque) and removal of the adapter tool from the connector shall be performed in accordance with Method 5A5 paragraphs 4.2.8 and 4.2.9 of MIL-STD-2042. When specified, the procedure shall be in accordance with Work package 011 03 paragraph 5i of [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#). When specified, the placement of the adapter tool onto the connector, the torque applied directly onto the adapter tool, then the removal of the adapter tool from the connector may be performed using only an affixed connector (i.e., a connector held securely in a fixture), adapter tool and torque wrench.

A.5.1.2.2 Applied torque: 100 cycles. The connector shall be placed in a fixture or other means used to secure the connector in place. The adapter tool shall be placed onto the connector, the specified torque (see 4.4) applied to the adapter tool for 2 seconds, and the adapter tool removed from the connector. This sequence of three steps is one cycle. This sequence (for the applied torque) shall be performed for 100 cycles. After the 100 cycles of applied torque are performed, the adapter tool performance shall be rated as listed in A.5.1.2.2.a through d.

- a. Function.
- b. Durability.
- c. Other input on the terminus removal tool performance.

A.5.1.3 Post applied torque visual and mechanical inspection. The visual and mechanical inspection shall be performed in accordance with MIL-STD-1678-3 Measurement 3105 with note 4/ of [TABLE 6306 A-II](#).

A.5.2 Evaluation package. An evaluation package shall be prepared for each polishing puck. The evaluation package shall include the documentation listed in A.5.2.a through c.

- a. Evaluation sheets for initial and post polishing inspections, ferrule protrusion measurements and post polishing measurements. Evaluation sheets used shall include the content as on the evaluation sheets in [appendix B](#).
- b. Data sheet information as specified in 4.2 and applicable items in TABLE 2201 A-I of MIL-STD-1678-2 Measurement 2201. This information may appear on a separate General Data Sheet (cover sheet) or incorporated into the evaluation sheet.
- c. Summary sheet with summary or table of inspections and measurements, the result (findings) of each, approval or recommended corrective actions, other pertinent input, signature or initials of reviewer or authority at approving activity. Summary sheet may be first page of the evaluation package.

A.6. Notes.A.6.1 Intents behind standardization efforts.

A.6.1.1 Multiple party testing considerations. The incentive to minimize test variables, resulting in a level playing field for multiple parties testing, leads the Government to establish a baseline. This baseline includes considerations for fabrication of test samples, methods to verify actions/measurements and use of specific test practices in addition to specifics for test sample configurations.

REQUIREMENT 6306

APPENDIX B

TERMINUS REMOVAL TOOL EVALUATION SHEETS

B.1 Excerpt from evaluation sheets to illustrate (1) adapter tool initial inspections, (2) applied torque both during assembly procedure and for 100 cycles performed, (3) post applied torque 100 cycles inspections, and (4) visual and mechanical inspection. Criteria listed in the evaluation sheets is taken from [TABLE 6306 A- I](#).

- a. Excerpt from an evaluation sheet to illustrate the adapter tool initial inspections.

TABLE 6306 B-I Evaluation sheet for adapter tool initial inspection.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
Function	Adapter tool shall fit into the cylindrical keying surface of the MIL-PRF-64266 multiple termini connector. Initial: No damage to the adapter tool or fiber optic connector shall result from placing or removing the adapter tool onto the connector.		
Dimensional interface with front end.	Dimensions for the adapter tool that interfaces with (allows entry into) the front end of the connector shall be designed to conform to figure A-1 of MIL-PRF-64266 for a connector plug and with figure A-2 of MIL-PRF-64266 for a connector receptacle. 1/ The surfaces along the length of the tool shall be round.		
Dimensional interface with mating keys and keyways	Dimensions for the adapter tool that interfaces with the mating keys on a connector plug and the mating keyways on a connector receptacle shall be designed to conform to figure A-3 of MIL-PRF-64266 . 1/ One adapter tool shall be provided for each shell size connector plug and each shell size connector receptacle.		
Number and types of keyways in adapter tools for connector plugs	Adapter tool shall be designed to have the mating master primary polarizing keyway, the master secondary polarizing keyway and all 8 clocking keyways for shall size 11 and all 12 clocking keyways for shell sizes 13, 15 and 23.		
Number and types of keys in adapter tool for connector receptacles	Adapter tool shall be designed to have the mating master primary polarizing key and the master secondary polarizing key at a minimum. Note: The preference is for the adapter tool to contain all 8 clocking keys for shall size 11 and all 12 clocking keys for shell sizes 13, 15 and 23 also.		
Dimensional interface with torque wrench	Adapter tool surface that interfaces with a torque wrench or other holding/tightening tool shall include a hole in the center of the surface to interface with a square drive. A hole for a 1/4 inch square drive shall be placed in the center of the surface for shell sizes 11, 13 and 15 adapter tools. A hole for a 3/8 inch square drive shall be placed in the center of the surface for a shell size 23 adapter tool.		
Envelop dimensions	Envelop shall be as specified in TABLE 6306-I		

See footnotes at end of table.

REQUIREMENT 6306

APPENDIX B

TABLE 6306 B-III Evaluation sheet for post applied torque visual and mechanical inspection.

If a failure is recorded, provide details on the extent of the failure observed (on bottom on data sheet).

1. Identification markings and color.a. Markings.

Criteria: All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Pass____ All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Fail____ All markings are not present. Specify on data sheet.

____ Height of markings is too small to read/distinguish characters. Specify on data sheet.

____ Markings are insufficiently legible (legible is if each character can be easily identified, even if some of the print is faded or removed). Specify on data sheet.

____ Markings are not permanent (permanent is if markings remain legible after completion of qualification test sequence). Specify on data sheet.

2. Workmanship, visual.a. Finish imperfections.

Criteria: No peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

Pass____ No finish imperfections observed that is detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail____ Observed sufficient peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

b. Surface imperfections.

Criteria: No rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations.

Pass____ No surface imperfections observed that are detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail____ Observed sufficient rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations. Specify on data sheet.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6306

APPENDIX B

c. Part imperfections.

Criteria: Product/parts are dimensionally uniform, free of lumps, kinks, splits, scraped or abraded surfaces, inclusions or other imperfections.

Pass_____ No part imperfections observed that are detrimental to form, fit or function or that could result in further protective material or function degradation

Fail_____ Observed product/parts are not dimensionally uniform, free of lumps, kinks, splits, scraped or abraded surfaces, inclusions or other imperfections. Specify on data sheet.

d. Mateability.

Criteria: Connectors, adapters, and other interconnecting devices (mateable items) mate and unmate easily and make proper connection.

Pass_____ No mateability or other mechanical interconnects observed that are detrimental to form, fit or function or that could result in preventing mating.

Fail_____ Connectors, adapters, and other interconnecting devices (mateable items) do not mate and unmate easily or do not make the proper connection. Specify on data sheet.

_____ Mateable items will not mate. Specify on data sheet.

_____ Mateable items were damaged during mating. Specify on data sheet.

_____ Mateable items did not make proper connection. Specify on data sheet.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

TERMINUS INSERTION TOOL INTERFACE REQUIREMENTS
(FOR MIL-PRF-64266 CONNECTOR)

1. Purpose. The interface requirements for a fiber optic terminus insertion tool are specified herein. These interface requirements are applicable to the MIL-PRF-29504/18 and MIL-PRF-29504 /20 terminus, the terminus designed to be used with the MIL-PRF-64266 connector. The intent is to provide a terminus insertion tool from multiple sources of supply that gives the Fleet/Field maintainer the ability to insert terminus into the connector insert from all qualified terminus sources of supply. Different terminus insertion tool configurations exist; however, the interface dimensions of the tool tip must conform to those of the terminus. This requirement is intended for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies.

1.1 Supplemental, function. The tool tip of the insertion tool must accommodate the MIL-PRF-29504/18 and MIL-PRF-29504/20 terminus crimp sleeve dimension and single fiber cable dimension. These interface dimensions are the ones cited in this requirement and are the ones that must be considered in the tip design of the terminus insertion tool. The requirements for the tool tip function are cited in [4.1](#).

1.2 Supplemental, item number. Item number assigned to the MIL-PRF-29504/18 and MIL-PRF-29504/20 terminus insertion tool is 6206CA and 6206CB (see [Requirement 6206](#)). For Navy Shipboard applications, approved terminus insertion tools are found in the Navy Shipboard Fiber Optic Recommended Tool List also.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-29504/18](#) - Termini, Fiber Optic, Connector, Removable, Environment Resisting, Genderless Terminus, Rear Release, Ceramic Ferrule, 1.25 MM Ferrule, (for MIL-PRF-64266 Connectors).
- [MIL-PRF-29504/20](#) - Test terminus, Fiber Optic, Keyed, Connector, Removable, Environment Resisting, Genderless Terminus, Rear Insert/Rear Release, 1.25 mm Ceramic Ferrule, (for MIL-PRF-64266 Connectors).
- [MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environment Resisting General Specification for

DEPARTMENT OF DEFENSE STANDARD

- [MIL-STD-2042](#) - Fiber Optic Cable Topology Installation, Standard Methods for Naval Ships
- [MIL-STD-2042-5](#) - Fiber Optic Cable Topology Installation Standard Methods for Naval Ships (Connectors and Interconnections) (Part 5 of 7 Parts)

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

2.3 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWCD Web Site in the Fiber Optics Recommended List section. This NSWCD Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWCD_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Alignment sleeve. A cylindrical, split ceramic tube that provides the mechanical and optical alignment of two mating connector/terminus ferrules.

3.2 Alignment sleeve retainer. An alignment sleeve retainer is a separate and removable housing used within the connector shell to retain captive alignment sleeves. The alignment sleeve retainer is part of the MIL-PRF-64266 connector. Use of an alignment sleeve retainer allows a one, genderless (really pin) terminus to be used in both the MIL-PRF-64266 connector plug and the connector receptacle. Functional/optical alignment is provided by the alignment sleeve retainer thorough the use of guide pins and alignment sleeves. A captive "jackscrew", which is a part of the alignment sleeve retainer, retains the alignment sleeve retainer within the connector shell.

3.3 ASR. Alignment sleeve retainer.

3.4 Termini. A component used in a fiber optic, multiple termini, connection that is inserted into one of the insert cavities of a multiple termini connector, provides a means to break and rejoin an optical path, and is terminated onto the end of a simplex, fiber optic cable. The term "termini" is the plural form for the word terminus.

3.5 Terminus. Singular form for the word termini.

3.6 Terminus removal tool. A tool used as a means to extract a fiber optic terminus that is seated properly within the insert of a multiple termini connector.

4. Requirements. The tip of the fiber optic terminus removal tool shall be standardized for commonality compliance across platforms to ensure the ability to extract MIL-PRF-29504/18 and MIL-PRF-29504/20 termini from the insert of a MIL-PRF-64266 multiple termini connector. Commonality compliance is that in which bounds or restricts the parts to those cited in [MIL-STD-2042-5](#), cited in the General Series Technical Manual for Fiber Optic Cabling ([NAVAIR 01-1A-505-1/T.O. 1-1A-14/TM 1-1500-232-24-4](#)) and, as a result, cited in this Standard Practice. Requirements for the terminus removal tool interface with the termini shall comply with 4.1 through 4.4.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

4.1 Function. The function of the terminus insertion tool tip shall be to fit around the cylindrical surface of a single fiber, fiber optic cable and press against the upper radial surface of the terminus crimp sleeve. With an applied downward (i.e., towards the rear of the terminus) load (force), press against the surface of the crimp sleeve rear "lip" (upper radial surface) for terminus insertion. Once completely seated in the connector insert cavity, a "snap", "click" or "pop" should be audible. No damage to the terminus insertion tool, terminus or fiber optic cable shall result from a terminus insertion.

4.2 Dimensional requirements. Tool tip on the terminus insertion tool shall be configured as a hollow cylinder with a gap to permit entry of the fiber optic cable exiting the terminus and with a diameter sufficient to press the against the terminus crimp sleeve.

4.2.1 Crimp sleeve diameter. The dimension for the tool tip that interfaces with the terminus shall be designed to accommodate the crimp sleeve diameter dimension that results after crimping. The crimp sleeve dimension prior to crimping is specified in MIL-PRF-29504/18 and /20.

4.2.2 Cable diameter. The dimension for the tool tip diameter that interfaces with the exposed length of single fiber cable (also referred to as the OFCC) shall be designed to accommodate the maximum cable diameter of 2.4 mm (.094 inch).

4.2.3 Slot gap width. The dimension for the tool tip length shall be designed to accept a fiber optic cable within the tool tip. The cylindrical length of the tool tip shall contain a slot with a gap width to allow a 2.4 mm (.094 inch) cable to be placed inside the cylindrical tool tip.

4.3 Materials. Terminus insertion tool material shall meet the durability, corrosion and applied load requirements of 4.3.1 through 4.3.3.

4.3.1 Durability. Material used for the tool tip shall be durable to survive 1000 termini insertions without showing any signs of wear and degradation in function.

4.3.2 Corrosion. Material used for the tool tip shall be corrosion resistant. If provided with a stainless steel tool tip, types of stainless steel listed in 4.3.4 are acceptable, otherwise the steel listed in 4.3.4.a is acceptable. A 300 series or a 400 series stainless steel is acceptable for the tool body (remainder of tool except for tool tip).

4.3.3 Applied load requirement. See 4.4.

4.3.4 Hardness. Tool tip (probe) hardness shall be as applicable for the materials listed in 4.3.4a through c.

- a. Hardened to Rockwell 53-57 Condition C for M2 steel and plated for corrosion resistance.
- b. Heat treated to Rockwell C38-42 for types 410 and 420 CRES.
- c. Heat treated to Rockwell C35-40 for type 416 CRES.

4.4 Applied load. Tool tip shall allow a specified force (load) of 22 ± 1 lb to be applied.

4.5 Markings. Terminus insertion tool shall be marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code. Markings shall be of minimum readable height (able to read/distinguish characters), and of sufficient legibility (each character can be easily identified, even if some of the print is faded or removed) and permanency (if markings remain legible after completion of qualification test sequence).

5. Implementation. Unless otherwise specified by the applicable Platform Office, fiber optic terminus insertion tool shall incorporate the interface dimensions and the interface requirements of 4.1 through 4.4. Verification of these requirements shall comply with 5.1 through 5.4.

5.1 Responsibility. Unless otherwise specified by the procuring activity, the supplier is responsible for the performance of all items contained herein with regard to the above requirements.

5.2 Performance verification. Dimensional data for the tool tip and load test data for the applied load may be provided to demonstrate performance; however, the Procuring Activity reserves the right to perform any of the inspections specified. When specified, test samples shall be submitted to the designated Approving Activity (see [appendix A](#)) for approval.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

5.2.1 Evaluation criteria. When the terminus removal tool is evaluated by the Approving Activity, the evaluation criteria used shall include the criteria as found in [appendix A](#).

5.2.2 Evaluation sheets. When the terminus removal tool is evaluated by the Approving Activity, the evaluation sheets used shall include the content as on the evaluation sheets in [appendix B](#).

5.3 Performance demonstration with fully populated connectors. When specified, test data submitted shall include verification for demonstration of successful terminus insertion into each insert cavity position in each shell size connector. As an alternative, selected insert cavity positions may be specified instead.

5.4 Restrictions. Terminus insertion into the insert cavity shall be performed on unmated connector plugs and unmated connector receptacles with the alignment sleeve retainer (ASR) removed.

6. Notes.

6.1 Intended use. On these platforms, the fiber optic terminus insertion tools are used to insert termini from a MIL-PRF-64266 multiple termini connector, are a part of (1) cable harnesses, and (2) equipment (electronic module/package) such as a ATR, LRC, LRM, LRU or WRA with internal fiber optics.

6.2 Damage prevention to cabling. The practice to "break edges" should be implemented to reduce the potential of the tool tip grabbing, nicking or scrapping the cable jacket when the tool tip is brought into contact with the cable jacket. Also, this is a recommended safety measure to prevent potential injury to personnel handling the terminus insertion tool.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

APPENDIX A

TERMINUS INSERTION TOOL EVALUATION CRITERIA

A.1 Intent. Verify that the terminus insertion tool meets criteria specified in Requirement 6307.

A.2. APPLICABLE DOCUMENTS

A.2.1 General. The documents listed in this section are specified in sections A.3, A.4, and A.5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements documents cited in sections A.3, A.4, and A.5 of this standard practice, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards and handbooks. The following specifications, standards and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-29504](#) - Termini, Fiber Optic Connector, Removable, General Specification for.
- [MIL-PRF-64266](#) - Connectors, Fiber Optic, Circular and Rectangular, Plug and Receptacle Style, Multiple Removable Genderless Termini, Environmental Resisting, General Specification for.

DEPARTMENT OF DEFENSE STANDARD

- [MIL-STD-2042](#) - Fiber Optic Cable Topology Installation, Standard Methods for Naval Ships
- [MIL-STD-2042-5](#) - Fiber Optic Cable Topology Installation Standard Methods for Naval Ships (Connectors and Interconnections) (Part 5 of 7 Parts)
- [MIL-STD-1678-2](#) - Fiber Optic Cabling Systems Requirements and Measurements (Part 2: Optical Measurements) (Part 2 of 6 Parts)

APPENDIX A

GENERAL SERIES TECHNICAL MANUAL

[NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#) - Installation and Testing Practices, Aircraft Fiber Optic Cabling

(A copy of this document is available online at: <https://mynatec.navair.navy.mil>. NATEC has three different processes to obtain the manual, depending on if you are Government personnel (military and civilians), Contractors with a Government contract, or everyone else. If unable to access this Web Site or require further assistance, contact (1) NATEC Customer Service: 619.545.1888, (2) NATEC Website Status Hotline: 619.545.1706, or (3) NATEC Customer Service E-mail: nani_customerservice@navy.mil.)

Navy Shipboard Fiber Optic Recommended Tool List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for test equipment) that may be applicable to the logistic support requirements for the specified tool. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

Navy Recommended Fiber Optic Components Parts List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optic Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for tools and for test equipment) that may be applicable to the logistic support requirements for the specified component. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

A.3 Definitions.

A.3.1 Approving activity. Unless otherwise specified, Naval Surface Warfare Center Dahlgren Division (NSWC DD) is the approving activity for approval to use a terminus insertion tool as specified in Requirement 6307.

A.3.2 Requesting party. Activity or vendor requests approval. Process begins by providing a terminus insertion tool (with specified certifications), being evaluated, and if in compliance, being placed on the Navy Shipboard Fiber Optic Recommended Tool List and into [MIL-STD-1678-6](#). Consideration for approval is based on demonstrating compliance as specified in Requirement 6307.

A.4 Requirements.

A.4.1 Evaluation criteria. Terminus insertion tool shall meet the criteria in [TABLE 6307 A- I](#). The evaluation process, including the requesting party's submissions, shall be performed in accordance with the steps listed in [TABLE 6307 A- II](#).

A.4.2 Certifications.

A.4.2.1 Certifications with initial submission. Certifications shall be submitted for terminus insertion tool material (to verify durability and corrosion) and to certify compliance to the tool tip interface with the terminus crimp sleeve and fiber optic cable.

A.4.2.2 Modifications and replacements. Once evaluated and approved, the approving activity shall be notified in writing or by e-mail of any modifications or substitutions made to the terminus insertion tool. Details of the modification or substitution shall be provided for the approving activity's determination if any or all portions of the evaluation need to be redone. Details should include any certifications and other documentation needed to make this determination.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

APPENDIX A

A.4.3 Terminated cable assemblies

A.4.3.1 Termini cable assembly pigtails. Termini cable assembly pigtails shall be included as part of the submission. Specific termini cable assembly pigtails shall conform to [TABLE 6307 A-III](#).

A.4.3.2 Applicable terminus types. Termini cable assembly pigtails (in [TABLE 6307 A-III](#)) may be tailored by the approving activity depending upon the variants of the terminus insertion tool submitted for approval.

A.4.3.3 Termination. Termini termination onto the terminus cable assembly pigtail shall be performed in accordance with MIL-STD-2042. When specified, these terminations shall be in accordance with [NAVAIR 01-1A-505-4/ T.O. 1-1A-14-4/TM 1-1500-232-24-4](#). Termination shall be performed so that the single fiber cable is affixed and crimped to the terminus. Epoxy and end face polishing is optional.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

APPENDIX A

TABLE 6307 A-I Evaluation table for terminus insertion tool.

Parameter	Pass Criteria	Requirement	
Function (terminus insertion process)	Initial: Terminus shall be inserted successfully when the following procedure is performed: Terminus insertion tool tip shall be fitted around the cylindrical surface of the single fiber cable and pressed against the upper radial surface of the terminus crimp sleeve. Apply a downward load (force) (i.e., towards the rear of the terminus), pressing against the surface of the rear "lip" on the crimp sleeve until a "click" is heard. Extract the terminus. Post 100 insertion cycles: Terminus insertion tool tip shall perform 100 terminus insertions with no binding or loosening (terminus wobbling).	4.1	
Crimp sleeve diameter.	Initial: Dimension for the radial surface of the tool tip that interfaces with and is able to press against the rear radial surface of the terminus crimp sleeve (after crimping occurs).	4.2.1	
Cable diameter.	Initial: Dimension for the tool tip diameter that interfaces with the exposed length of single fiber cable (also referred to as the OFCC) is able to accommodate the maximum cable diameter of 2.4 mm (.094 inch)	4.2.2	
Slot gap width	Initial: Dimension for the slot width (gap) in the cylindrical portion of the tool tip that allows a fiber optic cable to be placed within the tool tip. The cylindrical length of the tool tip shall contain a slot with a gap width to allow a 2.4 mm (.094 inch) cable to be placed inside the cylindrical tool tip.	4.2.3	
Cable jacket damage prevention.	Initial: No sharp edges on tool tip (see 6.2). Post 100 insertion cycles: No tool tip grabbing, nicking, scrapping or tearing of the cable jacket observed.	4.1	
Durability	Pass: Metal that is sufficiently durable to survive 1000 insertions. Sufficiently durable: Initial - If acceptable material used (4.3.4 materials; M2 steel or 410, 416, 420 CRES; are acceptable for tool tip) and withstands applied load with no evidence of breakage, cracking, chipping or other damage that would impair tool terminus removal function. <u>1/</u> Post 100 insertion cycles - Without showing any signs of wear and degradation in function during and after completion of 100 insertion cycles.	4.3.1	
Corrosion	Initial: Material is sufficiently corrosion resistant (300 or 400 series stainless steel (CRES) is acceptable for body, M2 steel or 410, 416, 420 CRES per 4.3.4 for tool tip). <u>2/</u>	4.3.2	
Hardness	Initial: <u>1/</u>	4.3.4	
Markings	Initial: Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code Post 100 removal cycles: easily identifiable, legibility and permanency	4.5	

See footnotes at end of table.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

APPENDIX A

TABLE 6307 A-I Evaluation table for terminus insertion tool – continued.

Parameter	Pass Criteria	Requirement	
Applied load cycles	Terminus insertion tool, including tool tip, can withstand an applied loading of 22 ± 1 lb. for 500 cycles. <u>3/</u>	4.4	
100 insertion cycles	Perform 100 terminus insertions. Perform post 100 insertion cycles inspections for Function, Cable jacket damage protection, Durability.	<u>4/</u>	
Post-100 insertion cycles visual and mechanical inspections	Workmanship: finish, surface, and part imperfections; matability with terminus Markings: easily identifiable, legibility and permanency	MIL-STD-1678-3 Measurements 3103, 3104	

1/ Certifications required: material to verify durability, corrosion and hardness.

2/ Certification provided that the terminus insertion tool meets the [MIL-STD-1678-3](#) Measurement 3401 requirement for a 48 hour salt spray test (equivalent to MIL-STD-202 Method 101). Certification shall include that testing was performed on terminus insertion tool under evaluation or a tool/component with the same material(s).

3/ An axial load shall be applied at a rate of 1.0 pound (4.4 N) per second up to the applied loading of 22 ± 1 lb. This applied load shall be maintained for a minimum of 2 seconds then released. This cycle shall be performed 500 times. At the end of 500 cycles, a visual inspection of the terminus removal tool shall be performed.

4/ One hundred (100) insertion cycles shall be performed using the ten terminated cable assembly pigtails specified in [TABLE 6307-III](#). The ten terminated cable assembly pigtails shall be placed in the insert rear face upper right quadrant cavity positions (18, 2, 3, 4, 5, 19, 20, 21, 31, and 32) of one shell size 23 MIL-PRF-64266 connector plug with a 36 cavity insert. Each of the ten terminated cable assembly pigtails shall be inserted successfully. When inserting the terminus in position 3 and when inserting the terminus in position 20, the other nine terminated cable assembly pigtails shall be installed. Adjacent termini shall not impede terminus insertion due to the geometry of the terminus insertion tool. Next, these ten terminated cable assembly pigtails shall be placed in the same insert cavity positions of the same shell size 23 MIL-PRF-64266 connector plug with a 36 cavity insert and inserted an additional four times for a total of five insertions for each of the ten terminated cable assembly pigtails. The ten terminated cable assembly pigtails shall be placed in the insert rear face left quadrant cavity positions (6, 7, 19, 20, 21, 22, 23, 31, 32 and 33) positions of one shell size 23 MIL-PRF-64266 connector receptacle with a 36 cavity insert. The same process shall be repeated for a total of five insertions for each of the ten terminated cable assembly pigtails. When inserting the terminus in position 6 and when inserting the terminus in position 32, the other nine terminated cable assembly pigtails shall be installed.

TABLE 6307 A-II. Actions (steps) required for terminus insertion tool approval process.

Step	Action	Submits <u>1/</u>	Receives <u>1/</u>	Addendum
1	Submits request, including required certifications, terminus insertion tool, ten terminus cable assembly pigtails and one shell size 23 MIL-PRF-64266 connector (both plug and receptacle) with a 36 cavity insert	Requesting Party	Approving Activity	<u>2/</u>
2	Performs terminus removal tool initial inspections in TABLE 6307 A-I up to the applied load.	Approving Activity	See step 5	<u>3/</u>
3	Perform cycling tests:			
3a	Performs the applied load cycles in accordance with note <u>3/</u> in TABLE 6307 A-I	Approving Activity	See step 5	
3b	Perform the 100 insertion cycles in accordance with note <u>4/</u> in TABLE 6307 A-I	Approving Activity	See step 5	
4	Performs post 100 removal cycle inspections:			
4a	Performs post 100 removal cycles Function, Cable jacket damage protection, Durability	Approving Activity	See step 5	<u>3/</u>
4b	Performs visual and mechanical inspection	Approving Activity	See step 5	<u>4/</u>
5	Provides results and decision on approval of terminus removal tool	Approving Activity	Requesting Party	

Notes:

1/ See A.3.1 and A.3.2.

2/ Each terminated cable assembly pigtail shall be provided with a unique identification marking.

3/ Criteria: See [TABLE 6307 A-I](#).

4/ Perform in accordance with (IAW) criteria specified in [TABLE 6307 A-I](#) supplemented by MIL-STD-2042, and by MIL-STD-1678 measurement 5202.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

APPENDIX A

TABLE 6307-III. Type and quantity of terminus cable assembly pigtails.

Terminus Type	Cable Type 1/ 2/	Quantity
M29504/20		10

1/ Cable assembly minimum length is 1 ft. (.30 meter) from ferrule tip (end face) to end of cable pigtail.

2/ Cable assembly pigtail shall be constructed with either MIL-PRF-85045/16-01 multimode cable or MIL-PRF-85045/16-02 single mode cable.

3/ Termination shall be performed so that the single fiber cable is affixed and crimped to the terminus. Epoxy and end face polishing is optional (see [A.4.3.3](#)).

A.5. Verification. Verification shall consist of the evaluation performed by the requesting party and by the approving activity as listed in [TABLE 6307 A-I](#) using the step specified in [TABLE 6307 A-II](#) and as further detailed in A.5.1.

A.5.1 Evaluation. The evaluation shall include the inspections and measurements in A.5.1.1 through A.5.1.3.

A.5.1.1 Terminus removal tool initial inspections. During the terminus removal tool initial inspections, the evaluator shall rate terminus removal tool performance as listed in A.5.1.1.a through i.

- a. Function (terminus insertion process).
- b. Crimp sleeve diameter.
- c. Cable diameter
- d. Slot gap width.
- e. Cable jacket damage protection.
- f. Durability.
- g. Corrosion.
- h. Hardness
- i. Markings

A.5.1.2 100 insertion cycles performed.

A.5.1.2.1 Applied load cycles. The applied load cycles shall be performed as cited in [TABLE 6307 A-I](#)

A.5.1.2.2 100 insertion cycles. The insertion cycles shall be performed as cited in [TABLE 6307 A-I](#).

A.5.1.2.3 Post 100 insertion cycles. After the 100 insertion cycles are performed, the evaluator shall rate terminus removal tool performance as listed in A.5.1.2.a through d.

- a. Function (terminus insertion process).
- b. Cable jacket damage protection.
- c. Durability.
- d. Other input on the terminus insertion tool performance.

A.5.1.3 Post 100 insertion cycles visual and mechanical inspection. The visual and mechanical inspection shall be performed in accordance with MIL-STD-1678-3 Measurement 3105 with note 4/ of [TABLE 6307 A-II](#).

A.5.2 Evaluation package. An evaluation package shall be prepared for each terminus insertion tool. The evaluation package shall include the documentation listed in A.5.2.a through c.

- a. Evaluation sheets. Evaluation sheets used shall include the content as on the evaluation sheets in [appendix B](#).
- b. Data sheet information as specified in 4.2 and applicable items in TABLE 2201 A-I of MIL-STD-1678-2 Measurement 2201. This information may appear on a separate General Data Sheet (cover sheet) or incorporated into the evaluation sheet.
- c. Summary sheet with summary or table of inspections and measurements, the result (findings) of each, approval or recommended corrective actions, other pertinent input, signature or initials of reviewer or authority at approving activity. Summary sheet may be first page of the evaluation package.

TERMINUS INSERTION TOOL EVALUATION SHEETS

B.1 Excerpt from evaluation sheets to illustrate (1) terminus insertion tool initial inspections, (2) 100 terminus insertions performed with post 100 terminus insertion inspections, and (3) visual and mechanical inspection. Criteria listed in the evaluation sheets is taken from [TABLE 6307 A-I](#).

a. Excerpt from an evaluation sheet to illustrate the terminus insertion tool initial inspections.

TABLE 6307 B-I Evaluation sheet for terminus insertion tool inspection.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
Function (terminus insertion process)	Terminus shall be inserted successfully when the following procedure is performed: Terminus insertion tool tip shall be fitted around the cylindrical surface of the single fiber cable and pressed against the upper radial surface of the terminus crimp sleeve. Apply a downward load (force) (i.e., towards the rear of the terminus), pressing against the surface of the rear "lip" on the crimp sleeve until a "click" is heard. Extract the terminus.		
Crimp sleeve diameter.	Dimension for the radial surface of the tool tip that interfaces with and is able to press against the rear radial surface of the terminus crimp sleeve (after crimping occurs).		
Cable diameter.	Dimension for the tool tip diameter that interfaces with the exposed length of single fiber cable (also referred to as the OFCC) is able to accommodate the maximum cable diameter of 2.4 mm (.094 inch)		
Slot gap width	Dimension for the slot width (gap) in the cylindrical portion of the tool tip that allows a fiber optic cable to be placed within the tool tip. The cylindrical length of the tool tip shall contain a slot with a gap width to allow a 2.4 mm (.094 inch) cable to be placed inside the cylindrical tool tip.		
Cable jacket damage prevention.	No sharp edges on tool tip (see 6.2)		
Durability	Pass: Metal that is sufficiently durable to survive 1000 insertions. Sufficiently durable: If acceptable material used (4.3.4 materials; M2 steel or 410, 416, 420 CRES; are acceptable for tool tip) and withstands applied load with no evidence of breakage, cracking, chipping or other damage that would impair tool terminus removal function. 1/		
Corrosion	Material is sufficiently corrosion resistant (300 or 400 series stainless steel is acceptable for body; M2 steel or 410, 416, 420 CRES per 4.3.4 for tool tip). 2/		
Hardness	Initial: 1/		
Markings	Marked with manufacturer's part number and with the manufacturer's name, logo or CAGE Code		
1/ Certifications required: material to verify durability, corrosion and hardness. 2/ Certification provided that the terminus insertion tool meets the MIL-STD-1678-3 Measurement 3401 requirement for a 48 hour salt spray test (equivalent to MIL-STD-202 Method 101). Certification shall include that testing was performed on terminus insertion tool under evaluation or a tool/component with the same material(s).

REQUIREMENT 6307

APPENDIX B

b. Excerpt from an evaluation sheet to illustrate terminus insertion tool post 100 insertion cycles inspection.

TABLE 6307 B-II Evaluation sheet for terminus insertion tool cycles and post 100 insertion cycles inspections.

Parameter	Pass Criteria	Pass	Fail- Provide Needed Corrective Action
Applied load cycles	Terminus insertion tool, including tool tip, can withstand an applied loading of 22 ± 1 lb. for 500 cycles. ^{1/}		
100 insertion cycles	Perform 100 terminus insertions. ^{2/} Perform post 100 insertion cycles inspections for Function, Cable jacket damage protection, Durability.		
Function (terminus insertion process)	Terminus insertion tool tip shall perform 100 terminus insertions with no binding or loosening (terminus wobbling).		
Cable jacket damage prevention.	No tool tip grabbing, nicking, scrapping or tearing of the cable jacket observed.		
Durability	Pass: Metal that is sufficiently durable to survive 1000 extractions (termini removals). Sufficiently durable: Without showing any signs of wear and degradation in function during and after completion of 100 insertion cycles.		
Other input on the terminus insertion tool performance			

^{1/} An axial load shall be applied at a rate of 1.0 pound (4.4 N) per second up to the applied loading of 22 ± 1 lb. This applied load shall be maintained for a minimum of 2 seconds then released. This cycle shall be performed 500 times. At the end of 500 cycles, a visual inspection of the terminus removal tool shall be performed.

^{2/} One hundred (100) insertion cycles shall be performed using the ten terminated cable assembly pigtails specified in TABLE 6307-III. The ten terminated cable assembly pigtails shall be placed in the insert rear face upper right quadrant cavity positions (18, 2, 3, 4, 5, 19, 20, 21, 31, and 32) of one shell size 23 MIL-PRF-64266 connector plug with a 36 cavity insert. Each of the ten terminated cable assembly pigtails shall be inserted successfully. When inserting the terminus in position 3 and when inserting the terminus in position 20, the other nine terminated cable assembly pigtails shall be installed. Adjacent termini shall not impede terminus insertion due to the geometry of the terminus insertion tool. Next, these ten terminated cable assembly pigtails shall be placed in the same insert cavity positions of the same shell size 23 MIL-PRF-64266 connector plug with a 36 cavity insert and inserted an additional four times for a total of five insertions for each of the ten terminated cable assembly pigtails. The ten terminated cable assembly pigtails shall be placed in the insert rear face left quadrant cavity positions (6, 7, 19, 20, 21, 22, 23, 31, 32 and 33) positions of one shell size 23 MIL-PRF-64266 connector receptacle with a 36 cavity insert. The same process shall be repeated for a total of five insertions for each of the ten terminated cable assembly pigtails. When inserting the terminus in position 6 and when inserting the terminus in position 32, the other nine terminated cable assembly pigtails shall be installed.

c. Excerpt from an evaluation sheet to illustrate cable assembly post 100 insertion cycles visual and mechanical inspection.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6307

APPENDIX B

TABLE 6307 B-III Evaluation sheet for cable assembly post 100 insertion cycles visual and mechanical inspection.

If a failure is recorded, provide details on the extent of the failure observed (on bottom on data sheet).

1. Identification markings and color.

a. Markings.

Criteria: All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Pass____ All markings are present, of correct/minimum readable height, and of sufficient legibility and permanency.

Fail____ All markings are not present. Specify on data sheet.

____ Height of markings is too small to read/distinguish characters. Specify on data sheet.

____ Markings are insufficiently legible (legible is if each character can be easily identified, even if some of the print is faded or removed). Specify on data sheet.

____ Markings are not permanent (permanent is if markings remain legible after completion of qualification test sequence). Specify on data sheet.

2. Workmanship, visual.

a. Finish imperfections.

Criteria: No peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

Pass____ No finish imperfections observed that is detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail____ Observed sufficient peeling or chipping of plating or finish, galling of wear, nicks, burrs, or other surface finish substandard blemishes or imperfections.

b. Surface imperfections.

Criteria: No rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations.

Pass____ No surface imperfections observed that are detrimental to form, fit, or function or that could result in further protective coating or material degradation.

Fail____ Observed sufficient rust, burnt areas, abrasions, holes, rough-head areas, bulges, thin spots, or indentations. Specify on data sheet.

PERFORMANCE REQUIREMENTS FOR PARTS AND SUPPORT EQUIPMENT
(6401-6406)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6401

SINGLE MODE OPTICAL LOSS TEST SET (OLTS) PERFORMANCE REQUIREMENTS

1. Purpose. The performance requirements for a fiber optic test set that measures the optical loss and the return loss on single mode fiber are specified herein. This type of fiber optic test set is referred to as an Optical Loss Test Set (OLTS). The intent of Requirement 6401 is to provide performance requirements, performance verification table and other needed clarification to determine compliance of a single mode OLTS to the specified performance requirements. This requirement is intended to support OLTS used for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies. Requirement 6401 is intended for Navy shipboard applications and those other applications in which the specified performance requirements can apply. Multiple OLTS configurations are specified. Two configurations are intended for Fleet (military) use and two for those determining conformance to MIL-STD-2042, but not used by Fleet personnel. Within each configuration, there are two types of interfaces (connection adapters). One type has the interfaces with PC polished connectors. The other type has the interfaces with APC polished connectors. For simplification, four configurations are defined rather than two configurations and two types within each configuration.

1.1 Supplemental, item number. Item number 6203LA is assigned to the single mode OLTS that is found in Requirement 6203 for Fleet use, interface with PC polished connectors. Item number 6203LC is assigned to the single mode OLTS that is found in Requirement 6203 for Fleet use, interface with APC polished connectors.

1.2 Configurations. Two configurations are specified for the single mode, optical loss test set that interfaces with PC polished connectors (see 4.7) and two for interfaces with APC polished connectors. These four configurations are listed in [TABLE 6401-I](#).

1.2.1 MIL-STD-2042 compliance. Two configurations, configurations A and C, are intended for determining conformance to MIL-STD-2042. These configurations include use by civilian personnel both in the Government and for contractors providing optical loss and return loss testing services to the Government. These performance requirements are a limited subset of those for configuration B and are listed in Requirement 6401. One configuration, configuration A, has connection adapters that interface with PC polished connectors. The other configuration, configuration C, has connection adapters that interface with APC polished connectors.

1.2.2 Fleet (military) use. Two configurations, configurations B and D, are intended for Fleet (military) use. These configurations include use by military personnel in Navy shipboard, submarine, and shore applications. These performance requirements were covered previously under a Subcategory (SCAT) code and are now updated and listed in Requirement 6401. These performance requirements are a larger set than those for configurations A and C. The increased requirements include those for environmental stresses/conditions (per MIL-STD-28800), data management and software. These performance requirements are listed in appendix A of Requirement 6401. One configuration, configuration B, has connection adapters that interface with PC polished connectors. The other configuration, configuration D, has connection adapters that interface with APC polished connectors.

TABLE 6401-I. Single mode optical loss test set (OLTS) configurations.

Configuration	Intended Use	Description ^{1/} , ^{2/}	Output Interface Port

REQUIREMENT 6401

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE STANDARDS

- [MIL-STD-2042](#) - Fiber Optic Cable Topology Installation, Standard Methods for Naval Ships, Parts 1 to 6.
- [MIL-PRF-28800](#) - Test Equipment for Use With Electrical and Electronic Equipment, General Specification for

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

Navy Shipboard Fiber Optic Recommended Test Equipment List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optics Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for component parts and for tools) that may be applicable to the logistic support requirements for the specified test equipment. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.3 Non-Government documents. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

AMERICAN NATIONAL STANDARDS INSTITUTE

- [ANSI Z136.2](#) – Safe Use of Optical Fiber Communication Systems Utilizing Laser Diode and LED Sources.

(A copy of this document is available on-line at www.ansi.org or from the ANSI Customer Service Department, 25 W. 43rd Street, 4th Floor, New York, NY 10036.)

TELECOMMUNICATIONS INDUSTRY ASSOCIATION

- [TIA-455-22](#) - Ambient Light Susceptibility.

(Copies of this document are available from <http://www.tiaonline.org> or from Telecommunications Industry Association, Standards and Technology Department, 2500 Wilson Boulevard Arlington, VA 22201.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6401

3. Definitions.

3.1 Mandrel wrapping. The appropriate single fiber cable is wrapped around the mandrel until a specified stable value is indicated on the OLTS display. Ten mandrel wraps are usually sufficient to obtain a stable value. This is a way to terminate the fiber to eliminate any back reflected light at the point of the mandrel wrap and beyond.

3.2 Measurement Quality Jumper (MQJ). The Measurement Quality Jumper (MQJ) is a low loss jumper that is used with test equipment to perform optical loss measurements. The MQJ must meet stringent optical loss requirements to ensure accuracy of measurements performed. Measurements must be accurate and repeatable. The accuracy and repeatability of your measurement is only as good as your MQJ. As the MQJ degrades with use, so does the measurement accuracy. The MQJ consists of a single fiber cable with a connector at one end which mates to the test equipment (optical source and power meter) and a connector at the other end which mates to the link/segment under test.

3.3 Optical fiber. An optical fiber is a thin cylindrical dielectric (non-conductive) waveguide used to send light energy for communication. Optical fibers consist of three parts: the core, the cladding, and the coating or buffer. The choice of optical fiber materials and fiber design depends on operating conditions and intended application.

3.4 Optical fiber, multimode. A multimode optical fiber is one that supports the propagation of more than one bound mode (electromagnetic wave).

3.5 Optical fiber, single mode. A small core optical fiber where one bounded electromagnetic wave of light will propagate at the wavelength of interest.

3.6 Optical loss. A measurement performed of the optical power level in which the set setup uses an optical source, power meter and measurement quality jumpers (MQJ).

3.7 Optical loss test set (OLTS). A fiber optic power level measurement device that contains both an optical source and a power meter within it case (enclosure). Most OLTS also contain the digital logic to perform calculations, have a user graphic display, and store then export data. Single mode OLTS also contain the fiber optic circuit paths to permit the measurement for optical return loss.

3.8 Optical source (fiber optic light source). A device that emits radiation in or near the visible region of the electromagnetic spectrum, for example, light-emitting diodes (LED), laser diodes (LD), and lamps (broad spectrum), for providing optical power to optical measurement system/instrumentation.

3.9 Optical return loss. This is the ratio of the reflected power, P_r , to the incident power, P_i , in the unit of measure of dB in a fiber optic system or link. The return loss is measured as a positive value. Although the ratio of reflected power to incident power is a fraction less than one, the minus sign in front of the equation for optical return loss makes the value calculated a positive quantity. The optical return loss is measured when two or more optical interfaces are in the fiber optic system or link.

3.10 Power meter (fiber optic detector or photo-detector). An optoelectronic device that accepts optical signals from an optical source through the propagation medium (including fiber optic cabling and the DUT or Device Under Test), detects them by converting them into electronic signals (through a light-sensitive element, such as a photodiode), amplifies, and further processes the electrical signal into units of measure of optical power in Watts (i.e., nano-Watts or micro-Watts) or power ratio in dB or dBm.

3.11 Reflectance. This is the ratio of the reflected power, P_r , to the incident power, P_i , in the unit of measure of dB at a single fiber optic interface or at one reflection point. The reflectance is measured as a negative value since the log of the ratio of reflected power to incident power is a fraction less than one (a negative value).

3.12 Support equipment. Equipment that is required to maintain, test, or operate an item, or facility, in its intended environment. An OLTS is one piece of support equipment.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6401

3.13 Termination, connector. The process performed for placing a connector, terminus, splice or other device at the end of an optical fiber. This placement optically minimizes leakage/losses and reflection. Terminations are used to join or connect two adjacent optical fiber ends or to terminate the fiber at either a source (electrical to optical conversion) or receiver (optical to electrical conversion) where the light leaves the optical fiber (waveguide) and continues in a non-waveguide mode of propagation.

3.14 Termination, mandrel wrapping. See 3.1.

4. Requirements. The OLTS shall be capable of performing optical power loss and backscattered light (return loss) measurements on single mode fiber optic paths. In optical loss measurement two identical units shall be interoperable (capable of performing measurements in a cooperative fashion). In optical return loss measurement a single unit shall be capable of performing a measurement within accuracies specified herein. Commonality compliance is that in which bounds or restricts the OLTS to those cited in this Standard Practice. Requirements for the OLTS with a configuration of A or C shall comply with 4.1 through 4.6, depending upon configuration being offered (see 4.7). The requirements and methods to verify these requirements shall conform to TABLE 6401-II for configurations A and C. A more extensive set of requirements (including conformance to the environmental conditions in MIL-PRF-28800) that are applicable to configurations B and D and are listed in appendix A, does not apply. For configurations A and C, the OLTS shall meet the requirements listed in TABLE 6401-II.

4.1 Optical (light) source: Each optical source in the OLTS shall be restricted to containing a Class 1 Laser (per [ANSI Z136.2](#)).

4.1.1 Wavelength: The OLTS shall contain at least two optical sources with a minimum at the wavelengths of 1310 nm ± 25 nm and 1550 nm ± 25 nm @ 25 $\pm 1^\circ\text{C}$

4.1.2 Linewidth: < 5 nm (3 dB down from peak)

4.1.3 Output power: > -10 dBm CW into 9 m fiber

4.1.3.1 Time stability: $\leq \pm 0.1$ dB / 4 hours and ≤ 0.1 dB peak/15 minutes; at constant temperature of 25 $\pm 1^\circ\text{C}$

4.1.3.2 Temperature stability:

$\leq \pm 0.25$ dB for temperature variations of $\pm 10^\circ\text{C}$ in the range of 17°C to 40°C

$\leq \pm 0.75$ dB for temperature variations of $\pm 25^\circ\text{C}$ in the range of 0°C to 50°C

4.1.3.3 Mechanical stability of connection port: Maximum variation of optical levels between repeated matings at the output port of the same unit shall be ≤ 0.2 dB

4.1.4 Output connector. See 4.6.3.1.

4.1.5 Mandrel. The OLTS shall be provided with one standard 0.25 inch diameter mandrel for single mode termination (see 3.14).

4.2 Power meter (optical detector).

4.2.1 Wavelength.

4.2.1.1 MIL-STD-2042 compliance. Operational range at least 800 nm to 1550 nm (calibration at cardinal points is acceptable).

4.2.1.2 Fleet use. Operational range at least 800 nm to 1650 nm (calibration at cardinal points is acceptable)

4.2.2 Measurement range.

4.2.2.1 MIL-STD-2042 compliance. -60 dBm to +3 dBm

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6401

4.2.2.2 Fleet use. -55 dBm to +5 dBm

4.2.3 Accuracy: $\pm 6\%$; at -10dBm @ 1310 nm

4.2.4 Linearity:

$\leq \pm 0.22$ dB over the range of optical power -40 dBm to +10 dBm

$\leq \pm 0.50$ dB over the range of optical power -55 dBm to -40 dBm

4.2.5 Display. The measurement values with units of measure, setup parameters and other OLTS operations shall be observed by means of a digital display.

4.2.5.1 Parameters. (a) Power level in dBm; (b) Loss in dB; (c) Wavelength in nm; (d) Low battery indicator

4.2.5.2 Resolution. At least 4 digits for power XX.XX dB (two digits to the right of a decimal point) and one digit to indicate if it is a positive or negative value.

4.2.6 Input connector. See 4.6.3.1.

4.2.7 Mechanical stability of connector. Maximum variation of optical levels between repeated mating at the input port of the same unit shall be ≤ 0.02 dB.

4.3 Optical loss measurements. The OLTS shall provide the following measurements as a minimum.

4.3.1 Dual wavelength test.

4.3.1.1 MIL-STD-2042 compliance. The equipment shall be capable of performing loss tests in both 1310 nm and 1550 nm wavelengths.

4.3.1.2 Fleet use. The OLTS shall be capable of performing loss tests in both 1310 nm and 1550 nm wavelengths without relocating the fiber connections.

4.3.2 Manual mode tests. In manual mode the OLTS shall be capable of operating as optical source and optical power meter.

4.3.3 Referencing. The OLTS shall be capable of making power reference to itself or to a second unit using a reference cable.

4.4 Return loss measurement.

4.4.1 Operating wavelengths. 1310 nm and 1550 nm

4.4.2 Range. Outside the specified ranges the OLTS shall either display "HI", "LOW", or the actual value.

4.4.2.1 Interface connection with ORL > 50 dB. 10 to 45 dB minimum (for a UPC connection).

4.4.2.2 Interface connection with ORL > 65 dB. 10 to 60 dB minimum (for an APC connection).

4.4.3 Accuracy.

4.4.3.1 Detector accuracy. $< \pm 1.0$ dB

4.4.3.2 Open air verification measurement. Between 14.3 dB and 15.9 dB

4.4.4 Reference (MQJ). The equipment shall be capable of establishing reference with an interface cable having an interface connection ORL from 30 dB to > 43 dB for a UPC connection and from 30 to > 63 dB for a APC connection (using a standard mandrel 10 turn light termination on the interface cable)

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6401

4.5 Ambient light susceptibility.

4.5.1 MIL-STD-2042 compliance. The power level shall not vary when exposed to direct sunlight. Verification shall be performed by covering the receive port with a dust cap and exposing the equipment to direct sunlight.

4.5.2 Fleet use. Ambient light susceptibility shall be < -60 dBm according to test procedure specified in standard TIA-455-22.

4.6 General requirements.

4.6.1 Power.

4.6.1.1 Warm up time. The equipment warm up time shall not exceed 20 minutes.

4.6.1.2 Internal DC battery. OLTS shall be capable of operating on either internal rechargeable or non-rechargeable batteries. Rechargeable batteries shall be provided for portable operation. For rechargeable batteries minimum operating time shall be at least 8 hours following a maximum recharge time of 14 hours. Non-rechargeable batteries shall be available from commercial market and the minimum operating time shall be at least 8 hours.

4.6.1.3 AC operation. External adapter provides DC to input jack. External adapter shall accept electrical power of 110/220 $\pm 10\%$ @ 60 Hz single phase.

4.6.1.4 Auto power off. The OLTS shall have an automatic turn off feature. The feature shall be activated when the absence of keyboard activity exceeds a set interval.

4.6.2 Physical features.

4.6.2.1 Dimensions. Less than 23 cm (9 in) height; 11 cm (4.3 in) width; 6 cm (2.4 in) depth for each test set.

4.6.2.2 Weight. 1 kg (2.2 lb) max for each test set (including optical source, sensor, and batteries)

4.6.3 Accessories.

4.6.3.1 Removable universal connector adapters are required to support interconnection on the optical (light) source and on the power meter (optical detector). The optical source shall support interconnection with UPC ST connector, or if APC, both the APC SC and APC FC connectors. The power meter shall support interconnection with UPC ST, UPC SC and UPC LC connectors or if APC, the APC SC, APC LC and APC FC connectors.

4.6.3.2 Protective caps and dust covers. Protective caps/dust covers for optical ports shall be provided.

4.6.3.3 Transit case.

4.6.3.3.1 MIL-STD-2042 compliance. A soft protective case can be provided for transporting the OLTS, accessories, and at least the Operator's manual.

4.6.3.3.2 Fleet use. A protective hard carrying case according to MIL-PRF-28800F shall be provided for transporting the OLTS. The transit case shall be capable to accommodate the OLTS, accessories, and at least the Operator's Manual.

4.6.3.4 Technical manual.

4.6.3.4.1 MIL-STD-2042 compliance. Operational manuals shall be provided.

4.6.3.4.2 Fleet use. Technical manuals shall be provided. At a minimum, these technical manuals shall consist of a Use manual and Installation manual (Operator's Manual).

4.6.3.5 Identification plate. The OLTS identification plate shall be permanently affixed to the OLTS. The identification plate shall contain the following information:

Manufacturer name and/or cage:

Part or model number:

Serial number:

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6401

4.7 Configurations. The OLTS specified in Requirement 6401 shall be configured for either Fleet use or for MIL-STD-2042 conformance.

4.7.1 MIL-STD-2042 conformance. The OLTS that is configured for MIL-STD-2042 conformance shall meet the more limited requirements in TABLE 6401–II. These OLTS configurations shall be referred to as “configurations A and C”.

4.7.2 Fleet use. The OLTS that is configured for Fleet use shall comply with the requirements specified in this requirement and APPENDIX A and in TABLE 6401 A-I. These OLTS configuration shall be referred to as “configurations B and D”.

5. Performance. The OLTS shall be used by civilian personnel to measure both optical loss and return loss in single mode, fiber optic cabling systems for determining conformance to MIL-STD-2042. The requirements and means to show compliance (means of verification) with these requirements shall conform to TABLE 6401–II.

5.1 Compliance verified. Once compliance of the OLTS to the performance requirements for configuration A or C is verified, the OLTS shall be listed on the Navy Shipboard Fiber Optic Recommended Test Equipment List.

5.2 Compliance test facility. Application for OLTS verification compliance to configuration A or C shall be submitted to NSWC DD by e-mail to NSWC DD Warfare Systems Department at DLGR_NSWC_FO_ENG@navy.mil. NSWC DD shall be the Government entity responsible for performing the testing to determine compliance to the performance requirements.

REQUIREMENT 6401

6. Notes.

6.1 Intended use. On these platforms, the OLTS is intended to measure the optical path from a terminus used in a MIL-PRF-28876/MIL-DTL-38999/MIL-PRF-64266 multiple termini connector or a single ferrule connector that is a part of (1) cable harnesses, and (2) equipment (electronic module/package) such as an ATR, LRC, LRM, LRU or WRA with internal fiber optics.

6.2 Requirement point of contact. Inquiries concerning the requirements listed for fiber optic test equipment for Navy shipboard applications should be addressed to [DLGR NSWC FO ENG@navy.mil](mailto:DLGR_NSWC_FO_ENG@navy.mil).

MIL-STD-1678-6A

REQUIREMENT 6401

APPENDIX A

OLTS CONFIGURATION FOR MILITARY APPLICATIONS

A.1 Intent. The OLTS configurations specified in this appendix are ones that has a more extensive set of requirements (such as environmental conditions) than the OLTS configurations specified in Requirement 6401. These configurations, referred to as configurations B and D, are intended for Fleet (military) use. These two configurations are for use by military personnel in Navy shipboard, submarine, and shore applications. The other two configurations, configurations A and C, are not covered by this appendix and are for use by civilian personnel both in the Government and for contractors providing optical loss and return loss testing services to the Government.

A.2. Applicable documents.

A.2.1 General. The documents listed in this section are specified in sections A.3, A.4, and A.5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections A.3, A.4, and A.5 of this standard practice, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

REQUIREMENT 6401

APPENDIX A

A.4. Requirements. The OLTS shall be capable of performing optical power loss and backscattered light (return loss) measurements on single mode fiber optic paths. In optical loss measurement, two identical units shall be interoperable (capable of performing measurements in a cooperative fashion). In optical return loss measurements, a single unit shall be capable of performing a measurement within accuracies specified herein. Commonality compliance is that in which bounds or restricts the OLTS to those cited in this Standard Practice. Requirements for the OLTS shall comply with 4.1 through 4.6 and with this appendix A.4.1 and A.4.2. The requirements and methods to verify these requirements shall conform to [TABLE 6401 A-I](#) for configurations B and D. Constraints on verification and for conformance to the environmental conditions in MIL-PRF-28800 are listed in A.5.1.

A.4.1 Power. In addition to those requirements specified in 4.6.1, the OLTS shall meet the requirements of A.4.1.1.

A.4.1.1 Lithium batteries. Per MIL-PRF-28800, lithium batteries are prohibited without prior authorization. Requests for approving the use of lithium batteries, including those encapsulated in integrated circuits, shall be submitted to the procuring activity at the time of submission of proposals. Approval shall apply only to the specific model proposed. Proposed lithium cells/batteries shall be constrained to those requirements specified in MIL-STD-1678-6 Requirement 6404. Reporting and design requirements for lithium batteries shall conform to MIL-STD-1678-6 Requirement 6404.

A.4.2 Accessories. In addition to those requirements specified in 4.6.3, the OLTS shall meet the requirements of A.4.2.1 through A.4.2.3.

A.4.2.1 Technical manual. Technical manuals shall conform to MIL-PRF-28800. A Use and Installation manual (Operator's Manual) shall be provided separately. Maintenance and Servicing manual shall be provided with all three levels of maintenance; unit operational verification, module level, and component level. The technical manual shall be provided in both printed and electronic formats. The printed format shall be otherwise normally provided. The electronic format shall consist of the installation programs for the latest version of Adobe Acrobat for all computer platforms for which Acrobat is available and the technical manual in an electronic form that is readable through use of the Adobe Acrobat application. A statement of copy right release for reproduction of technical manual for government use shall be printed in the first two pages of each technical manual. A statement of copy right release for reproduction of technical manual CD for government use shall be printed on each CD.

A.4.2.2 Training material. Training material that demonstrates the features, basic operations and procedures with step-by-step instructions for using the equipment as an OLTS/ORLM shall be provided. The material can be either on a CD with an interactive feature or in a technical manual format.

A.4.2.3 Identification plate. As per MIL-PRF-28800, the OLTS identification plate shall be permanently affixed to two places on the OLTS and in front of the transit case. The identification plate shall contain the following information:

- Manufacturer name and/or cage:
- Part or model number:
- Serial number:
- National stock number:
- Contract Number:
- Military nomenclature or "Part of":

MIL-STD-1678-6A

REQUIREMENT 6401

TABLE 6401 A-I. OLTS list of requirements and verification methods, for fleet use (Configurations B and D)-Continued.

MIL-PRF-28800 table 2 environmental conditions	APPENDIX A - A.5.1
Temperature, not operating	Class 3
Temperature, operating	Class 3
Relative humidity	Class 3
Altitude, not operating	Class 3
Altitude, operating	Class 3
Vibration limits	Class 3
Bounce, loose cargo	Not Applicable
Shock, functional	Class 3
Transit drop	Class 3
Bench handling	Class 3
Shock, high impact	Not Applicable
Watertight	Not Applicable
Splash proof	Not Applicable
Drip proof	Not Applicable
Fungus resistance	Class 3
Salt exposure, enclosure	Class 3
Salt exposure, structural parts	Class 3
Explosive atmosphere	Not Applicable
Dust resistance	Applicable
Solar radiation	Not Applicable
EMC	Applicable

1/ Perform per MIL-PRF-28800 table 2 except as specified in paragraph A.5.1 herein.

2/ Perform on OLTS outside (without) the transit case per MIL-PRF-28800 table 2 (see A.5.1 herein).

3/ Conformance to other non-measurement parameters are based on those found in SCAT 4954/SCAT 4952.

A.5 Verification. Unless otherwise specified, the performance requirements of 4.1 through 4.6 and APPENDIX A sections A.4.1 and A.4.2 shall comply with the verifications for the fleet use configuration (see APPENDIX A, TABLE 6401 A-I) with the additional requirements and constraints specified in A.5.1. These requirements and constraints for configurations B and D include conformance to the environmental conditions in MIL-PRF-28800 (see TABLE 6401 A-I). Requests for candidate submission and selection of the most suitable candidate for inclusion into the Government National Stock system (configurations B and D) shall be performed the Naval Inventory Control Point Mechanicsburg (NAVICP). NAVICP has the Naval Research Laboratory (NRL) do the testing to determine conformance to performance requirements. Method of verification shall be determined by NRL.

A.5.1 Environmental conditions. The OLTS shall be verified to meet the requirements of MIL-PRF-28800 class 3 for Navy shipboard, submarine, and shore applications, as specified in TABLE 6401 A-I with the following exceptions:

- a. The OLTS shall withstand a non-operating temperature requirement limited to the range of -20°C to +60°C at a non- condensing RH up to 95%.
- b. The OLTS shall be sealed against dirt/humidity. Both the relative humidity test and the dust resistance test shall be performed with the OLTS outside the transit case.
- c. The OLTS shall be ruggedized to accommodate minor impacts. The transit drop test shall be performed both with the OLTS in a hard transit case and with the OLTS outside the transit case (i.e., the equipment class where the OLTS enclosure is intended to act as the transit case). The bench handling test shall be performed on the OLTS outside the transit case.
- d. The OLTS shall withstand an operating temperature requirement of -10C to +50C.
- e. The OLTS shall be verified to meet EMC requirements without the electrostatic discharge immunity requirement.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

MULTIMODE OPTICAL LOSS TEST SET (OLTS) PERFORMANCE REQUIREMENTS

1. Purpose. The performance requirements for a fiber optic test set that measures the optical loss on multimode fiber are specified herein. This type of fiber optic test set is referred to as an Optical Loss Test Set (OLTS). The intent of Requirement 6402 is to provide performance requirements, performance verification table and other needed clarification to determine compliance of a multimode OLTS to the specified performance requirements. This requirement is intended to support OLTS used for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies. Requirement 6402 is intended for Navy shipboard applications and those other applications in which the specified performance requirements can apply. Multiple OLTS configurations are specified. One configuration is intended for Fleet (military) use and one for those determining conformance to MIL-STD-2042, but not used by Fleet personnel.

1.1 Supplemental, item number. Item number 6203LB is assigned to the multimode OLTS that is found in Requirement 6203 for fleet use, interface with PC polished connectors.

1.2 Configurations. Two configurations are specified for the multimode, optical loss test set that interfaces with PC polished connectors (see 4.7). These two configurations are listed in TABLE 6402-I.

1.2.1 MIL-STD-2042 compliance. Configuration A is intended for determining conformance to MIL-STD-2042. This configuration includes use by civilian personnel both in the Government and for contractors providing optical loss testing services to the Government. These performance requirements are a limited subset of those for configuration B and are listed in Requirement 6402.

1.2.2 Fleet (military) use. Configuration B is intended for Fleet (military) use. This configuration includes use by military personnel in Navy shipboard, submarine, and shore applications. These performance requirements were covered previously under a Subcategory (SCAT) code and are now updated and listed in Requirement 6402. These performance requirements are a larger set than those for configuration A. The increased requirements include those for environmental stresses/conditions (per MIL-STD-28800). These performance requirements are listed in appendix A of Requirement 6402.

TABLE 6402-I. Multimode Optical Loss Test Set (OLTS) configurations.

Configuration	Intended Use	Description <u>1/</u> , <u>2/</u>
A	MIL-STD-2042 compliance	OLTS, MM, SP1678 R6402, configuration A
B	Fleet <u>3/</u>	OLTS, MM, SP1678 R6402, configuration B

1/ OLTS = Optical Loss Test Set, MM = Multimode

2/ SP1678 = Standard Practice MIL-STD-1678, R6402 = Requirement 6402

3/ Item 6203LB in Requirement 6203 TABLE 6203-VII.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

(Copies of this document are available from <http://www.tiaonline.org> or from Telecommunications Industry Association, Standards and Technology Department, 2500 Wilson Boulevard Arlington, VA 22201.)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Mandrel wrapping. The appropriate single fiber cable is wrapped around the mandrel until a specified stable value is indicated on the OLTS display. Ten mandrel wraps are usually sufficient to obtain a stable value. This is a way to terminate the fiber to eliminate any back reflected light at the point of the mandrel wrap and beyond.

3.2 Measurement Quality Jumper (MQJ). The Measurement Quality Jumper (MQJ) is a low loss jumper that is used with test equipment to perform optical loss measurements. The MQJ must meet stringent optical loss requirements to ensure accuracy of measurements performed. Measurements must be accurate and repeatable. The accuracy and repeatability of your measurement is only as good as your MQJ. As the MQJ degrades with use, so does the measurement accuracy. The MQJ consists of a single fiber cable with a connector at one end which mates to the test equipment (optical source and power meter) and a connector at the other end which mates to the link/segment under test.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

3.3 Optical fiber. An optical fiber is a thin cylindrical dielectric (non-conductive) waveguide used to send light energy for communication. Optical fibers consist of three parts: the core, the cladding, and the coating or buffer. The choice of optical fiber materials and fiber design depends on operating conditions and intended application.

3.4 Optical fiber, multimode. A multimode optical fiber is one that supports the propagation of more than one bound mode (electromagnetic wave).

3.5 Optical fiber, single mode. A small core optical fiber where one bounded electromagnetic wave of light will propagate at the wavelength of interest.

3.6 Optical loss. A measurement performed of the optical power level in which the set setup uses an optical source, power meter and measurement quality jumpers (MQJ).

3.7 Optical Loss Test Set (OLTS). A fiber optic power level measurement device that contains both an optical source and a power meter within it case (enclosure). Most OLTS also contain the digital logic to perform calculations, have a user graphic display, and store then export data. Single mode OLTS also contain the fiber optic circuit paths to permit the measurement for optical return loss.

3.8 Optical source (fiber optic light source). A device that emits radiation in or near the visible region of the electromagnetic spectrum, for example, light-emitting diodes (LED), laser diodes (LD), and lamps (broad spectrum), for providing optical power to optical measurement system/instrumentation.

3.9 Optical return loss. This is the ratio of the reflected power, P_r , to the incident power, P_i , in the unit of measure of dB in a fiber optic system or link. The return loss is measured as a positive value. Although the ratio of reflected power to incident power is a fraction less than one, the minus sign in front of the equation for optical return loss makes the value calculated a positive quantity. The optical return loss is measured when two or more optical interfaces are in the fiber optic system or link.

3.10 Power meter (fiber optic detector or photo-detector). An optoelectronic device that accepts optical signals from an optical source through the propagation medium (including fiber optic cabling and the DUT or Device Under Test), detects them by converting them into electronic signals (through a light-sensitive element, such as a photodiode), amplifies, and further processes the electrical signal into units of measure of optical power in Watts (i.e., nano-Watts or micro-Watts) or power ratio in dB or dBm.

3.11 Reflectance. This is the ratio of the reflected power, P_r , to the incident power, P_i , in the unit of measure of dB at a single fiber optic interface or at one reflection point. The reflectance is measured as a negative value since the log of the ratio of reflected power to incident power is a fraction less than one (a negative value).

3.12 Support equipment. Equipment that is required to maintain, test, or operate an item, or facility, in its intended environment. An OLTS is one piece of support equipment.

3.13 Termination, connector. The process performed for placing a connector, terminus, splice or other device at the end of an optical fiber. This placement optically minimizes leakage/losses and reflection. Terminations are used to join or connect two adjacent optical fiber ends or to terminate the fiber at either a source (electrical to optical conversion) or receiver (optical to electrical conversion) where the light leaves the optical fiber (waveguide) and continues in a non-waveguide mode of propagation.

3.14 Termination, mandrel wrapping. See 3.1.

4. Requirements. The OLTS shall be capable of performing optical power loss measurements on multimode fiber optic paths. For this optical loss measurement, two identical units shall be interoperable (capable of performing measurements in a cooperative fashion). Commonality compliance is that in which bounds or restricts the OLTS to those cited in this Standard Practice. Requirements for the OLTS with a configuration of A comply with 4.1 through 4.6, depending upon configuration being offered (see 4.7). The requirements and methods to verify these requirements shall conform to TABLE 6402-I for configuration A. A more extensive set of requirements (including conformance to the environmental conditions in MIL-PRF-28800) that are applicable to configuration B are listed in APPENDIX A. For configurations A, the OLTS shall meet the requirements listed in [TABLE 6402-II](#).

4.1 Optical (light) source. Each optical source in the OLTS shall be restricted to containing a Class 1 Light Emitting Diode or LED (per [ANSI Z136.2](#)).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

4.1.1 Wavelength. The OLTs shall contain at least two optical sources with a minimum at the wavelengths of 1300 nm ± 30 nm and 850 nm ± 30 nm @ 25 $\pm 1^\circ\text{C}$

4.1.1.1 Bandwidth. < 170 nm

4.1.2 Launch conditions.

4.1.2.1 Coupled Power Ratio (CPR)

- a. CPR 1300 nm source: Optical light source shall have a CPR value of [21 dB to 22 dB] ± 0.5 dB (into 62.5 μm fiber).
- b. CPR 850 nm source: Optical light source shall have a CPR value of [24 dB to 26 dB] + 0.5dB/-1.0 dB (into 62.5 μm fiber).

4.1.2.2 High Order Mode Power (HOMP)

- a. HOMP 1300 nm source: Optical power loss in a nominal 62.5 μm fiber caused by five wraps around a 20 mm mandrel shall be in the range of 0.30 dB to 0.80 dB.
- b. HOMP 850 nm source: Optical power loss in a nominal 62.5 μm fiber caused by five wraps around a 20 mm mandrel shall be in the range of 0.30 dB to 0.80 dB.

4.1.2.3 Fiber optic cables for CPR and HOMP verifications.

- a. Single mode cable with 5.2 μm MFD at 850 nm wavelength.
- b. Single mode cable with 9.2 μm MFD at 1310 nm wavelength.
- c. Multimode cable with 62.5 μm core diameter at both 850 nm and 1300 nm wavelengths.
- d. Government furnished equipment for MIL-STD-2042 compliance. Cables in 4.1.2.3a through 4.1.2.3.c terminated with ST connectors will be provided to manufacturers for CPR and HOMP measurements.
- e. Government furnished equipment for Fleet use: Cables in 4.1.2.3a through 4.1.2.3.c terminated with diamond connectors will be provided to manufacturers for CPR and HOMP measurements.

4.1.3 Output power. > -21 dBm (into 62.5/125 μm).

4.1.3.1 Time stability. $\leq \pm 0.1$ dB / 4 hours and ≤ 0.05 dB peak/15 minutes; each stability level test performed at a constant temperature of 25 $\pm 1^\circ\text{C}$.

4.1.3.2 Temperature stability.

- a. $\leq \pm 0.25$ dB for temperature variations of $\pm 10^\circ\text{C}$ in the range of 17°C to 40°C
- b. $\leq \pm 0.50$ dB for temperature variations of $\pm 25^\circ\text{C}$ in the range of 0°C to 50°C

4.1.3.3 Mechanical stability of connection port. Maximum variation of optical levels between repeated mating at the output port of the same unit shall be ≤ 0.1 dB

4.1.4 Output connector. See 4.6.3.1.

4.2 Power meter (optical detector).

4.2.1 Wavelength.

4.2.1.1 MIL-STD-2042 compliance. Operational range at least 800 nm to 1550 nm (calibration at cardinal points is acceptable).

4.2.1.2 Fleet use. Operational range at least 800 nm to 1650 nm (calibration at cardinal points is acceptable).

4.2.2 Measurement range.

4.2.2.1 MIL-STD-2042 compliance. -60 dBm to +3 dBm.

4.2.2.2 Fleet use. -55 dBm to +5 dBm.

4.2.3 Accuracy. $\pm 6\%$; at -20dBm @ 1300 nm.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

4.2.4 Linearity.

- $\leq +0.22$ dB over the range of optical power -40 dBm to +10 dBm.
- $\leq +0.50$ dB over the range of optical power -55 dBm to -40 dBm except 850 nm wavelength.
- $\leq +0.75$ dB over the range of optical power -55 dBm to -40 dBm 850 nm wavelength.

4.2.5 Display. The measurement values with units of measure, setup parameters and other OLTS operations shall be observed by means of a digital display.

4.2.5.1 Parameters. (a) Power level in dBm; (b) Loss in dB; (c) Wavelength in nm; (d) Low battery indicator

4.2.5.2 Resolution. At least 4 digits for power XX.XX dB (two digits to the right of a decimal point) and one digit to indicate if it is a positive or negative value.

4.2.6 Input connector. See 4.6.3.1.

4.2.7 Mechanical stability of connector. Maximum variation of optical levels between repeated mating at the input port of the same unit shall be ≤ 0.02 dB.

4.3 Optical loss measurements. The OLTS shall provide the following measurements as a minimum.

4.3.1 Dual wavelength test.

4.3.1.1 MIL-STD-2042 compliance. The equipment shall be capable of performing loss tests in both 850 nm and 1300 nm wave lengths.

4.3.1.2 Fleet use. The OLTS shall be capable of performing loss tests in both 850 nm and 1300 nm wave lengths without relocating the fiber connections.

4.3.2 Manual mode tests: In manual mode the OLTS shall be capable of operating as optical source and optical power meter.

4.3.3 Referencing: The OLTS shall be capable of making power reference to itself or to a second unit using a reference cable.

4.4 Return loss. Not applicable.

4.5 Ambient light susceptibility.

4.5.1 MIL-STD-2042 compliance. The power level shall not vary when exposed to direct sunlight. Verification shall be performed by covering the receive port with a dust cap and exposing the equipment to direct sunlight.

4.5.2 Fleet use. Ambient light susceptibility shall be < -60 dBm according to test procedure specified in standard TIA-455-22.

4.6 General requirements.

4.6.1 Power.

4.6.1.1 Warm up time. The equipment warm up time shall not exceed 20 minutes.

4.6.1.2 Internal DC battery: OLTS shall be capable of operating on either internal rechargeable or non-rechargeable batteries. Rechargeable batteries shall be provided for portable operation. For rechargeable batteries minimum operating time shall be at least 8 hours following a maximum recharge time of 14 hours. Non-rechargeable batteries shall be available from commercial market and the minimum operating time shall be at least 8 hours.

4.6.1.3 AC operation. External adapter provides DC to input jack. External adapter shall accept electrical power of 110/220 $\pm 10\%$ @ 60 Hz single phase.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

4.6.1.4 Auto power off. The OLTS shall have an automatic turn off feature. The feature shall be activated when the absence of keyboard activity exceeds a set interval.

4.6.2 Physical features.

4.6.2.1 Dimensions. Less than 23 cm (9 in) height; 11 cm (4.3 in) width; 6 cm (2.4 in) depth for each test set.

4.6.2.2 Weight. 1 kg (2.2 lb) max for each test set (including optical source, sensor, and batteries)

4.6.3 Accessories.

4.6.3.1 Removable universal connector adapters are required to support interconnection on the optical (light) source and on the power meter (optical detector). The optical source shall support interconnection with UPC ST connector. The power meter shall support interconnection with UPC ST, UPC SC and UPC LC connectors.

4.6.3.2 Protective caps and dust covers. Protective caps/dust covers for optical ports shall be provided.

4.6.3.3 Transit case.

4.6.3.3.1 MIL-STD-2042 compliance. A soft, protective case can be provided for transporting the OLTS, accessories, and at least the Operator's Manual.

4.6.3.3.2 Fleet use. A protective hard carrying case according to MIL-PRF-28800F shall be provided for transporting the OLTS. The transit case shall be capable to accommodate the OLTS, accessories, and at least the Operator's Manual.

4.6.3.4 Technical manual.

4.6.3.4.1 MIL-STD-2042 compliance. Operational manuals shall be provided.

4.6.3.4.2 Fleet use. Technical manuals shall be provided. At a minimum, these technical manuals shall consist of a Use manual and Installation manual (Operator's Manual).

4.6.3.5 Identification plate. The OLTS identification plate shall be permanently affixed to the OLTS. The identification plate shall contain the following information:

Manufacturer name and/or cage:

Part or model number:

Serial number:

4.7 Configurations. The OLTS specified in Requirement 6401 shall be configured for either Fleet use or for MIL-STD-2042 conformance.

4.7.1 MIL-STD-2042 conformance. The OLTS that is configured for MIL-STD-2042 conformance shall meet the more limited requirements in TABLE 6402-II. This OLTS configuration shall be referred to as "configuration A."

4.7.2 Fleet use. The OLTS that is configured for Fleet use shall comply with the requirements specified in this requirement and APPENDIX A and in TABLE 6402-II. This OLTS configuration shall be referred to as "configuration B".

5. Performance. The OLTS shall be used by civilian personnel to measure optical loss in multimode, fiber optic cabling systems for determining conformance to MIL-STD-2042. The requirements and means to show compliance (means of verification) with these requirements shall conform to TABLE 6402-II.

5.1 Compliance verified. Once compliance of the OLTS to the performance requirements for configuration A is verified, the OLTS shall be listed on the Navy Shipboard Fiber Optic Recommended Test Equipment List.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

5.2 **Compliance test facility.** Application for OLTS verification compliance to configuration A shall be submitted to NSWCD by e-mail to NSWCD Warfare Systems Department at DLGR_NSWC_FO_ENG@navy.mil. NSWCD shall be the Government entity responsible for performing the testing to determine compliance to the performance requirements.

TABLE 6402–II. OLTS list of requirements and verification methods, for civilian use (configuration A).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

6. Notes.

6.1 Intended use. On these platforms, the OLTS is intended to measure the optical path from a terminus used in a MIL-PRF-28876/MIL-DTL-38999/MIL-PRF-64266 multiple termini connector or a single ferrule connector that is a part of (1) cable harnesses, and (2) equipment (electronic module/package) such as an ATR, LRC, LRM, LRU or WRA with internal fiber optics.

6.2 Requirement point of contact. Inquiries concerning the requirements listed for fiber optic test equipment for Navy shipboard applications should be addressed to [DLGR NSWC FO ENG@navy.mil](mailto:DLGR_NSWC_FO_ENG@navy.mil).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

APPENDIX A

OLTS CONFIGURATION FOR MILITARY APPLICATIONS

A.1. Intent. The OLTS configuration specified in this appendix is one that has a more extensive set of requirements (such as environmental conditions) than the OLTS configuration specified in Requirement 6402. This configuration, referred to as configuration B, is intended for Fleet (military) use. This configuration is for use by military personnel in Navy shipboard, submarine, and shore applications. The other configurations, configuration A, are not covered by this appendix and are for use by civilian personnel both in the Government and for contractors providing optical loss testing services to the Government.

A.2. Applicable documents.

A.2.1 General. The documents listed in this section are specified in sections A.3, A.4, and A.5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections A.3, A.4, and A.5 of this standard practice, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE STANDARDS

[MIL-STD-1678-6](#) - Fiber Optic Cabling Systems Requirements and Measurements (Part 6: Parts and Support Equipment Commonality and Standardization Requirements, Cable Harness Configurations) (Part 6 of 6 Parts)

[MIL-PRF-28800](#) - Test Equipment for Use With Electrical and Electronic Equipment, General Specification For

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

A.2.2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

[SCAT 4954/SCAT 4952](#), NRL 5524 of 13 March 2002

(A copy of where to obtain this SCAT can be requested by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "SCAT REQUEST".)

A.2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

A.3. Definitions. Definitions for terms used in this appendix can be found in paragraph 3 of Requirement 6401.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

APPENDIX A

A.4. Requirements. The OLTS shall be capable of performing optical power loss measurements on multimode fiber optic paths. For this optical loss measurement, two identical units shall be interoperable (capable of performing measurements in a cooperative fashion). Commonality compliance is that in which bounds or restricts the OLTS to those cited in this Standard Practice. Requirements for the OLTS shall comply with 4.1 through 4.6 and with this appendix A.4.1 and A.4.2. The requirements and methods to verify these requirements shall conform to [TABLE 6207A - I](#) for configuration B. Constraints on verification and for conformance to the environmental conditions in MIL-PRF-28800 are listed in A.5.1.

A.4.1 Power. In addition to those requirements specified in 4.6.1, the OLTS shall meet the requirements of A.4.1.1.

A.4.1.1 Lithium batteries. Per MIL-PRF-28800, lithium batteries are prohibited without prior authorization. Requests for approving the use of lithium batteries, including those encapsulated in integrated circuits, shall be submitted to the procuring activity at the time of submission of proposals. Approval shall apply only to the specific model proposed. Proposed lithium cells/batteries shall be constrained to those requirements specified in MIL-STD-1678-6 Requirement 6404. Reporting and design requirements for lithium batteries shall conform to MIL-STD-1678-6 Requirement 6404.

A.4.2 Accessories. In addition to those requirements specified in 4.6.3, the OLTS shall meet the requirements of A.4.2.1 through A.4.2.3.

A.4.2.1 Technical manual. Technical manuals shall conform to MIL-PRF-28800. A Use and Installation manual (Operator's Manual) shall be provided separately. Maintenance and Servicing manual shall be provided with all three levels of maintenance; unit operational verification, module level, and component level. The technical manual shall be provided in both printed and electronic formats. The printed format shall be otherwise normally provided. The electronic format shall consist of the installation programs for the latest version of Adobe Acrobat for all computer platforms for which Acrobat is available and the technical manual in an electronic form that is readable through use of the Adobe Acrobat application. A statement of copy right release for reproduction of technical manual for government use shall be printed in the first two pages of each technical manual. A statement of copy right release for reproduction of technical manual CD for government use shall be printed on each CD.

A.4.2.2 Training material. Training material that demonstrates the features, basic operations and procedures with step-by-step instructions for using the equipment as an OLTS/ORLM shall be provided. The material can be either on a CD with an interactive feature or in a technical manual format.

A.4.2.3 Identification plate. As per MIL-PRF-28800, the OLTS identification plate shall be permanently affixed to two places on the OLTS and in front of the transit case. The identification plate shall contain the following information:

Manufacturer name and/or cage:
Part or model number:
Serial number:
National stock number:
Contract Number:
Military nomenclature or "Part of":

1/ Perform per MIL-PRF-28800 table 2 except as specified in paragraph A.5.1 herein.

2/ Perform on OLTS outside (without) the transit case per MIL-PRF-28800 table 2 (see A.5.1 herein).

3/ Conformance to other non-measurement parameters are based on those found in [SCAT 4954/SCAT 4952](#).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6402

APPENDIX A

A.5 Verification. Unless otherwise specified, the performance requirements of 4.1 through 4.6 and appendix A sections A.4.1 and A.4.2 shall comply with the verifications for the Fleet use configuration (see APPENDIX A, TABLE 6402A – I) with the additional requirements and constraints specified in A.5.1. These requirements and constraints for configuration B includes conformance to the environmental conditions in MIL-PRF-28800 (see TABLE 6402A – I). Requests for candidate submission and selection of the most suitable candidate for inclusion into the Government National Stock system (configurations B and D) shall be performed the Naval Inventory Control Point Mechanicsburg (NAVICP). NAVICP has the Naval Research Laboratory (NRL) do the testing to determine conformance to performance requirements. Method of verification shall be determined by NRL.

A.5.1 Environmental conditions. The OLTS shall be verified to meet the requirements of MIL-PRF-28800 class 3 for Navy shipboard, submarine, and shore applications, as specified in TABLE 6402A – I with the following exceptions:

- a. The OLTS shall withstand a non-operating temperature requirement limited to the range of -20°C to +60°C at a non- condensing RH up to 95%.
- b. The OLTS shall be sealed against dirt/humidity. Both the relative humidity test and the dust resistance test shall be performed with the OLTS outside the transit case.
- c. The OLTS shall be ruggedized to accommodate minor impacts. The transit drop test shall be performed both with the OLTS in a hard transit case and with the OLTS outside the transit case (i.e., the equipment class where the OLTS enclosure is intended to act as the transit case). The bench handling test shall be performed on the OLTS outside the transit case.
- d. The OLTS shall withstand an operating temperature requirement of -10C to +50C.
- e. The OLTS shall be verified to meet EMC requirements without the electrostatic discharge immunity requirement.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6403

POLISHING APPROVAL PROCESS CRITERIA
FOR USE OF A MACHINE POLISHER WITH ALTERNATE POLISHING MATERIALS

1. Purpose: The criteria for the process to approve the use of a machine polisher (polishing machine) is specified herein. These criteria are applied when there is an activity/vendor pursuing approval for the use of a machine polisher with alternate polishing materials (i.e., an alternate machine polishing process) that is not rigidly adhering to the use of the polishing papers for the hand polishing processes in MIL-STD-2042.

1.1 Current constraint. In accordance with MIL-STD-2042, alternate polishing materials may be used if authorized approval is obtained. If the manufacturing process is proprietary, then approval is limited to the requesting activities internal cable assembly locations (i.e., where the polishing steps for the cable assembly fabrication occurs). Polishing processes performed in the Fleet/field must be accessible to auditors.

1.2 Objective. The objective is to use a machine polisher with a polishing process that produces the same end face geometry, same visual inspection quality and minimizes the change in the ferrule protrusion length during the polishing process to the extent of not affecting optical performance during environmental exposures (such as temperature, vibration, shock) as is obtained with the MIL-STD-2042 polishing process.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

[MIL-STD-1678-6](#) - Parts and support equipment commonality and standardization requirements

(Copies of these documents are available online at <https://quicksearch.dla.mil> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

2.2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

[NSWC DD ltr.](#) – Navy Shipboard Fiber Optic Recommended Components Parts List

(A copy of this list can be obtained at NSWC DD Web Site in the Fiber Optic Recommended List section. This NSWC Dahlgren fiber optic web site houses additional shipboard fiber optic lists (for tools and for test equipment) that may be applicable to the logistic support requirements for the specified part. Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Connector, fiber optic. A device that permits repeated mating and couples the optical power between two optical fibers or two groups of optical fibers. A fiber optic connector must maintain fiber alignment without significant loss of optical power.

3.2 Ferrule end face. Surface of the ferrule used to make contact with the mating ferrule and/or the mating fiber. This surface is perpendicular to the longitudinal axis of the optical fiber.

3.3 Ferrule length gauge. An instrument used to measure the protruding ferrule length from the barrel (body) of the fiber optic terminus or single ferrule connector to the ferrule end face.

3.4 Machine polisher. A device or mechanism used to finely grind the ferrule end face of a single ferrule connector or terminus without any human intervention during the grinding process. Unless the machine polisher is automated, human intervention is required for setup and adjustment. This is opposed to a hand polish that is performed by human interaction with polishing tools.

3.5 Measurement Quality Jumper (MQJ). The Measurement Quality Jumper (MQJ) is a low loss jumper that is used with test equipment to perform optical loss measurements. The MQJ must meet stringent optical loss requirements to ensure accuracy of measurements performed. Measurements must be accurate and repeatable. The accuracy and repeatability of your measurement is only as good as your MQJ. As the MQJ degrades with use, so does the measurement accuracy.

3.6. Polish. The process that removes most surface imperfections on the end face of the fiber caused by the cleaving the fiber. This process is performed in multiple steps. In each step, the connector/terminus ferrule is placed into a polishing tool/puck and moved over a specified roughness (grit) abrasive paper, usually in a figure-eight motion. Polishing steps proceed from rough to fine polish. For more enhanced return loss results, a slurry polish would be included as the last step in the process.

3.7 Polish, Angle Physical Contact (APC). Ferrule end face is polished in a manner so that the fibers are the first to make contact when connection surfaces at an 8 degree angle from the perpendicular are mated together.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6403

3.8 Polish, offset. The polish offset is the distance between the highest point on the connector end face (where the center of the bull's eye pattern is observed on an interferometer) and the center of the fiber. This offset is also referred to as the linear offset, eccentricity or apex offset.

3.9 Polish, Physical Contact (PC). Ferrule end face is polished in a manner so that the fibers are the first to make contact when connection surfaces are mated together.

3.10 Polishing Tool (Puck), APC polish. A fixture used in the polishing process to hold the ferrule of a single ferrule connector or a terminus so that ferrule end face is at an 8 degree angle from the perpendicular and extends below the fixture's flat bottom.

3.11 Polishing Tool (Puck), PC polish. A fixture used in the polishing process to hold the ferrule of a single ferrule connector or a terminus so that ferrule end face is perpendicular to and extends below the fixture's flat bottom.

3.12 Support equipment. Equipment that is required to maintain, test, or operate an item, or facility, in its intended environment. A machine polisher is one piece of support equipment.

3.13 Termination, connector. The process performed for placing a connector, terminus, splice or other device at the end of an optical fiber. This placement optically minimizes leakage/losses and reflection. Terminations are used to join or connect two adjacent optical fiber ends or to terminate the fiber at either a source (electrical to optical conversion) or receiver (optical to electrical conversion) where the light leaves the optical fiber (waveguide) and continues in a non-waveguide mode of propagation.

3.14 Termini. A component used in a fiber optic, multiple termini, connection that is inserted into one of the insert cavity of a multiple termini connector and terminated onto the end of a simplex, fiber optic cable. Termini is the plural form for the word terminus.

3.15 Terminus. This term is the singular form for the word termini.

4. Requirements. The requesting activity or vendor (see 6.2) shall be capable of demonstrating that use of a specific machine polisher with alternate polishing materials shall meet the actions cited in [TABLE 6403-I](#). Alternate polishing materials (i.e., an alternate machine polishing process) are defined as ones that are not rigidly adhering to the use of the polishing films (also referred to as papers or disks) as specified for the hand polishing process in MIL-STD-2042.

4.1 Work instructions. Work instructions shall include the information in 4.1.1 through 4.1.4.

4.1.1 Applicability. Applicable termini/connector types, fiber types (SM/MM), and polish types (standard, enhanced, APC) shall be identified.

4.1.2 Techniques. These techniques shall include information on operation and lessons learned for use with the machine polisher. The techniques used shall be stated to minimize the change in the ferrule protrusion length (i.e., minimize ferrule material removal) during the polishing process.

4.1.3 Polishing steps. The steps performed during the polishing process shall be provided.

4.1.3.1 Parameters. Details within each step shall include the polishing films, wet or dry polish, speed, duration, pad durometer, pressure and values for other critical parameters. Details can be provided in a tabular format.

4.1.3.2 Various configurations. Variations of each step shall be included that accounts for different termini/connector types, fiber types, and polish types.

4.1.4 Approval. Work instructions are approved once step 3 in [TABLE 6403-I](#) is completed.

4.2 Termination. Except for the alternate polishing process, termination of the test samples shall be performed in accordance with MIL-STD-2042.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6403

4.2.1 Test sample configuration (terminated cable assembly). Connections listed in [TABLE 6403-II](#) shall be terminated onto the ends of MIL-PRF-84045/16 to comprise the terminated cable assembly once step 5 in [TABLE 6403-I](#) is completed. Connectors to be placed on each end of the MIL-PRF-85045/16 cable shall be those listed in [TABLE 6403-III](#). Specific cable type used (i.e., either MIL-PRF-85045/16-01 or MIL-PRF-85045/16-02) shall conform to [TABLE 6403-IV](#).

4.2.2 Alternate polishing process. The alternate polishing process shall be performed to the approved work instructions as specified in [4.1](#). Polish type for each of the terminated cable assemblies in the set shall conform to the quantities listed in [TABLE 6403-IV](#).

4.3 Applicable connector/terminus types. Terminated cable assemblies along with the connectors/termini used (in [TABLE 6403-II](#) and [TABLE 6403-III](#)) may be tailored by the approving activity depending upon the connector/terminus types to be covered under the polishing process submitted for approval.

5. Verification. Verifications shall consist of those performed by either the requesting activity or by the submitting activity as listed in [TABLE 6403-I](#) and as further detailed in 5.1 through 5.5.

5.1 Proposal. The request to use a machine polisher with an alternate polishing process shall be prepared as a proposal. This proposal shall include information on the machine polisher, scope of the alternate polishing process and intended use or customer. The scope shall include planned deviations from that cited in MIL-STD-2042.

5.2 Work instructions. Review shall include compliance with [TABLE 6403-I](#) and [4.1](#).

5.3 Pre-polished ferrule protrusion length. Measurement shall be performed using a tool that complies with [MIL-STD-1678-6](#) Requirement 6305. Measurement of the ferrule protrusion length shall consist of the length as specified in 6.2 of [MIL-STD-1678-6](#) Requirement 6305.

5.4 Optical measurements. Optical measurement for optical insertion loss and optical return loss shall comply with [MIL-STD-1678-2](#) Requirement 2101 and MIL-STD-1678-2 Requirement 2105, respectively.

5.5 Post polished measurements. Measurements shall be performed as listed in 5.5.a through e.

- a. Measurement for visual inspection: MIL-STD-1678-3 Requirement 3105 with note 7/ of [TABLE 6403-I](#).
- b. Measurement for optical insertion loss: MIL-STD-1678-2 Requirement 2101 with note 8/ of [TABLE 6403-I](#).
- c. Measurement for optical return loss: MIL-STD-1678-2 Requirement 2105 with note 9/ of [TABLE 6403-I](#).
- d. Measurement for end face geometry: note 10/ of [TABLE 6403-I](#).
- e. Measurement for ferrule protrusion length: See 5.3.

1/ Same polish on both ends. Cable assembly minimum length is 1 meter from ferrule tip (end face) to ferrule tip.

2/ MM = Multimode, SM = Single Mode.

3/ Standard PC polish is the standard procedure for the domed end polish in MIL-STD-2024.

4/ Enhanced PC polish is the enhanced procedure for the domed end polish in MIL-STD-2024.

5/ Cable assembly shall be constructed with MIL-PRF-85045/16-01 multimode cable.

6/ Cable assembly shall be constructed with MIL-PRF-85045/16-02 single mode cable.

7/ Cable assembly with an APC polish shall be terminated with APC polished SC connectors, not ST connectors.

6. Notes.

6.1 Intents behind standardization efforts.

6.1.1 Multiple party testing considerations. The incentive to minimize test variables, resulting in a level playing field for multiple parties testing, leads the Government to establish a baseline. This baseline includes considerations for fabrication of test samples, methods to verify actions/measurements and use of specific test practices in addition to specifics for test sample configurations.

6.2 Requesting and approving parties.

6.2.1 Approving activity. Naval Surface Warfare Center Dahlgren Division (NSWC DD) is the approving activity for approval to use a machine polisher with alternate polishing materials as specified in Requirement 6403.

6.2.2 Requesting activity. Activity or vendor is under consideration for approval to use a machine polisher with alternate polishing materials. Consideration for approval is based on demonstrating compliance as specified in Requirement 6403.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6404

REPORTING AND DESIGN REQUIREMENTS FOR LITHIUM BATTERIES

1 Intent. Fiber optic, portable test equipment (test equipment) is prohibited from containing lithium batteries without prior authorization (from the procurement agency or platform program manager). Requirement 6404 specifies the reporting information to be provided and the design requirements that must be met when the test equipment contains lithium batteries. The constraints apply to test equipment intended for use by military personnel in the Fleet/field and by civilian personnel both in the Government and for contractors providing testing services to the Government.

1.2 Limitations

1.2.1 Types. Use of lithium battery types in test equipment is restricted to primary (non-rechargeable) lithium coin cells for integrated circuit memory retention and to secondary (rechargeable) lithium-ion batteries to power the test equipment.

1.2.1.2 Service. The set of requirements listed are specific to Navy shipboard, submarine, shore and Marine Corp applications; however, a similar set of requirements apply to other mobile military platforms (such as aircraft) and to the other services.

1.3 Hazard classification. The use of lithium cells and batteries in Navy systems and equipment offers the advantage of increased voltage and longer life, when compared to other power sources. Lithium batteries can provide increased energy density, extremely high currents, and can discharge very rapidly when short-circuited. Although these characteristics are useful in applications requiring sustained high current, a too-rapid discharge of a lithium battery can result in overheating of the battery, rupture, and even explosion. Because of these risks, lithium batteries shall be considered hazardous at all times. The Department of the Navy has adopted a Lithium Battery Safety Program to minimize hazards associated with their use.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this standard practice to the extent specified herein. Unless otherwise specified, the issues are these documents are those cited in the solicitation or contract.

FEDERAL REGISTER

Code of Federal Regulations

Title 29 – Labor

(A copy of this document is available online at http://www.dol.gov/dol/cfr/Title_29 or from the U.S. Department of Labor, Frances Perkins Building, 200 Constitution Avenue, NW, Washington, DC 20210).

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6404

2.4 Reporting. When the lithium cells or batteries do not meet the requirements of 4.1 or 4.2 whichever is applicable, then Navy entity certifying the test equipment must submit a request letter and safety data package to request the use of lithium batteries to the specified Navy technical authority. This reporting requires that the information listed in 3.1 through 3.5. This information is to be provided by the test equipment vendor prior to test equipment submittal for approval. When the lithium cells or batteries do meet the requirements of 4.1 or 4.2 whichever is applicable, then the reporting requirements are reduced to an initial procurement report with the information listed in 3.6.

3.1 Justification. Explain why a lithium cell and/or battery is needed.

3.2 Design data to report. Provide the proposed lithium cell or battery design data listed in a through o.

- a. Manufacturer (name, address, phone number);
- b. Model number and/or part number;
- c. Electrical description (voltage, ampere-hour (Ah) capacity, and nominal load profile);
- d. Electrical safety devices integral to the cell/battery;
- e. Cell/battery configuration (cells/batteries in parallel or series);
- f. Operating life (shelf life and functional life);
- g. Physical dimensions and description (weight, size, geometry, number of cells, battery housing description);
- h. Marking indicating battery chemistry;
- i. Cell and/or battery yield pressure (if unvented, battery/housing room ambient yield pressure);
- j. All applicable Material Safety Data Sheets (MSDSs), Product Information Sheets or equivalent document;
- k. Cell failure mode (indicating whether a single cell failure can cascade into multiple cell failures).
- l. Discharge rate.
- m. For secondary batteries only, rated cycle-life (versus depth of discharge) and the mean-time-between failures for the cell/battery;
- n. For secondary batteries only, discharge and recharge rates including the limiting discharge/charge rates.
- o. For primary coin cells only, initial procurement report from the purchaser.

3.3 System information to report. Lithium battery powered system description listed in a through l.

- a. Description of system purpose or function;
- b. Manufacturer (name, address phone number);
- c. Model number and/or part number and device name;
- d. Diagram of the system's overall mechanical interfaces showing battery proximity to other equipment and energetic devices;
- e. Battery installation (mounting, seals, electrical connectors);
- f. Battery housing/container, strength, and free volume;
- g. Safety features or venting mechanisms (description and estimate of operational venting pressure);
- h. Current drain (load profile of the system);
- i. Block diagram of system interfaces to the battery (electrical and physical);
- j. Electrical schematic (showing fuses, blocking diodes, and external power interface);
- k. Description of the charger and charge control mechanism, if applicable. (Are cells individually equilibrated, or is the battery charged as a series/parallel string?). Provide information for large form lithium batteries sufficient to support evaluation that features of the charging system related to charging safety have been included in the design, validated, and tested.
- l. Description of other controls or mechanisms to enhance battery safety, such as a Battery Management System (BMS), software shutdown mechanism, etc.

3.4 Logistic information to report. Lithium battery logistical information listed in a through c.

- a. Packaging. How will system/battery be packaged?
- b. Storage facilities. How will system/battery be stored from delivery to disposal?
- c. Transportation methods.

3.5 Test equipment point of contact. Provide name, organization (company), e-mail address and telephone number.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6404

3.6 Initial procurement report requirements. When the lithium cells or batteries do meet the requirements of 4.1 or 4.2, whichever is applicable, then the information listed in a through e shall be reported.

- a. Subject: Initial procurement report.
- b. Manufacturer/brand name.
- c. Model identification (name and number).
- d. Use scenario/environment (e.g., surface ship, submarine, other network platform).
- e. Point of contact (name, organization, e-mail, telephone number).

4. Design constraints. Test equipment with lithium cells or batteries must comply with the specific design constraints listed in 4.1 and 4.2. Also, batteries or cells shall be selected with the lowest possible total capacity to meet the test equipment electrical power requirement. When the lithium cells or batteries do not meet one or more of the requirements of 4.1 or 4.2, whichever is applicable, then the design constraints listed in 4.3 through 4.5 apply.

4.1 Non-rechargeable lithium coin cell. The design constraints shall conform to a through e.

- a. Unmodified, commercial-off-the-shelf (COTS) item;
- b. Used in single-cell configuration;
- c. Maximum nominal output of 3 Volts;
- d. Maximum rated capacity of 1 Ah;
- e. The battery is protected from other sources of electrical power by appropriate combinations of blocking diodes and resistors.

4.2 Rechargeable lithium-ion batteries. The design constraints shall conform to a through g.

- a. Unmodified, COTS battery;
- b. Underwriter's Laboratories (UL) listed;
- c. Used in the device as recommended by the manufacturer. Modifications to the devices may only be made in accordance with the manufacturer's recommendations; e.g., addition of memory;
- d. Recharged only by devices expressly designed for recharge of the specific battery in use;
- e. No more than four cells in series (less than or equal to 18-Volt output);
- f. Rated for no more than 100 Watt-hours, as listed in the manufacturer's specification or calculated by multiplying the capacity in Ah by the maximum working (nominal performance) voltage;
- g. There shall be no attempt to open, modify, reform, or repair batteries.

4.3 Battery protection. The design constraints shall conform to a through i.

- a. Over-Current Protection. Each battery used as a power source shall contain a suitable over-current device. Devices shall either go to the open-circuit position if the battery is discharged at an excessive rate; e.g., fuse or relay; or must limit the current flow to a safe level; e.g., Positive Thermal Coefficient (PTC) Device. Batteries must be over-current protected in the ground lead of each series string. Each separate circuit shall be protected. If the battery is tapped to provide different output voltages, each tap shall be protected with an over-current device.
- b. Charging Prevention. In primary (non-rechargeable) batteries consisting of series-parallel strings, each parallel string shall be protected to prevent any possibility of charging. If a primary (non-rechargeable) battery is connected to an external power source, the battery must be protected to prevent charging by the external power source.
- c. Battery Compartment. The equipment shall be designed with a special compartment for the battery. This compartment shall have no interior projections or sharp edges that could damage the electrical insulation around the battery. The battery shall be secured within the compartment to resist shock and vibration to the levels required for end item use.
- d. Power Switches. Power switches in the end item shall be selected to prevent accidental battery turn-on. Switching devices shall not be used in the ground leg(s).
- e. Cell Uniformity. Cells of different physical characteristics, chemistries, or electrical parameters shall not be used in the same electrical circuit.
- f. Internally-Pressurized Cells. All internally-pressurized cells shall be hermetically sealed and constructed so that the case-to-cover seal is a continuous weld, free from holes and other imperfections. The seal between the electrode and the cover shall be of the glass-or ceramic-to-metal or equivalent type and free from imperfections.
- g. Safety-Venting Devices. Each cell, battery, and battery compartment must incorporate a safety-venting device or be designed and manufactured in such a manner that will preclude a violent rupture as a result of cell venting. Nothing shall be done in the design and construction that will degrade the vent.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6404

- h. Thermal Protection Devices. Consideration shall be given to the use of thermal protection devices, which go to the open-circuit position at temperatures of 91 degrees C (196 degrees F) or less. Thermal protection devices must be located in close proximity to each cell string, not physically isolated from the cell or cell string being protected.
- i. Positive Protection Against Accidental Shorting. When the battery is not installed in equipment, the leads or connector plug shall be taped, guarded, or otherwise designed or provided with positive protection against accidental shorting.

4.4 Charging system. The design constraints shall conform to a through d.

- a. Charging Sources. Rechargeable battery systems shall be designed to prevent charging by any charging source other than that specifically approved for the battery.
- b. Cell-To-Cell Balancing Mechanisms. During charging, differences in individual cells may lead to differing voltages in cell groups. Some cells may be undercharged, with a result of decrease in the overall battery capacity. Conversely, some cells may be overcharged, with the result of cell damage, shortening of life cycle, or the creation of safety issues. In order to achieve a uniform state of charge, consideration shall be given to including a cell-to-cell balancing mechanisms for use during battery charging systems.
- c. Overvoltage Protection. Rechargeable batteries shall have integrated overvoltage (over-charge) protection. These protections must disconnect the battery from the charging source. Disconnect must be automatic and not require operator action.
- d. Battery Management System (BMS). Large form rechargeable batteries must use a battery management system that provides access to information on the performance, cycle-count, age, and condition of the battery. This BMS may be integral to the battery and include the protections of paragraph 4.4.b and 4.4.c above, or the BMS may be an interface to the system the battery is installed in. These guidelines are also recommended for smaller batteries.

4.5 Warning Labels. The test equipment shall have an external label warning users of the hazards associated with lithium batteries and shall be marked in accordance with container warning requirements of 29 Code of Federal Regulations (CFR) 1910.1200.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

Optical Time Domain Reflectometer (OTDR) PERFORMANCE REQUIREMENTS

1 Purpose. The performance requirements are specified herein for a fiber optic test instrument that displays the attenuation, distance and reflectance for each event found along the optical path, referred to as a trace. This type of fiber optic test instrument is referred to as an Optical Time Domain Reflectometer (OTDR). The intent of Requirement 6405 is to provide performance requirements and other needed clarification to determine compliance of an OTDR. This requirement is intended to support an OTDR used for developmental, prototype, production, rework and modification programs on military platform fiber optic cable assemblies. Requirement 6405 is intended for Navy shipboard applications and other applications in which the specified performance requirements can apply. Two OTDR configurations are specified. One configuration is intended for Fleet (military) use and one for determining conformance to MIL-STD-2042, but not used by Fleet personnel. Each OTDR consists of a mainframe, plug-in modules and accessories. Two categories of plug-in modules are standard modules and auxiliary modules. Standard plug-in modules are provided with the OTDR. There are two standard plug-in modules, a multimode module for PC polished connectors and a single mode module for PC polished connectors. Auxiliary modules would be procured separately when required by the application and are intended for MIL-STD-2042 users. There are three auxiliary plug-in modules: a single mode module for APC polished connectors, a multimode module with centimeter resolution for PC polished connectors, and a single mode module with centimeter resolution for PC polished connectors.

1.2 Configurations. Two configurations are specified for the OTDR. These two configurations are listed in table 6405-I.

1.2.1 MIL-STD-2042 compliance. Configuration A is intended for determining conformance to MIL-STD-2042. This configuration includes use by civilian personnel both in the Government and for contractors providing optical testing services to the Government (such as optical loss, return loss, distance-to-fault troubleshooting, trace recording/profiling/analysis). These performance requirements are a limited subset of those for configuration B and are listed in Requirement 6405.

1.2.2 Fleet (military) use. Configuration B is intended for Fleet (military) use. This configuration includes use by military personnel in Navy shipboard, submarine, and shore applications. These performance requirements were covered previously under a Subcategory (SCAT) code and are now updated and listed in Requirement 6405. These performance requirements are a larger set than those for configuration A. The increased requirements include those for environmental stresses/conditions (per MIL-STD-28800). These performance requirements are listed in appendix A of Requirement 6405.

Due to the dynamic nature of web addresses the current website URL can be obtained by e-mailing DLGR_NSWC_FOWEB@navy.mil with the subject line "WEBSITE URL REQUEST". An automated reply will contain the current web address.)

2.3 Non-Government documents. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are cited in the solicitation or contract.

AMERICAN NATIONAL STANDARDS INSTITUTE

[ANSI Z136.2](#) - Safe Use of Optical Fiber Communication Systems Utilizing Laser Diode and LED Sources.

(A copy of this document is available on-line at www.ansi.org or from the ANSI Customer Service Department, 25 W. 43rd Street, 4th Floor, New York, NY 10036.)

3. Definitions.

3.1 Attenuation Dead Zone. The attenuation dead zone is the minimum distance in which two consecutive events (the first reflective and the second non-reflective) can be both observed (detected) and the loss of the second measured.

3.2 Dead zone. Dead zones occur in measuring the distance along the cable due to reflective pulses of light coming back from reflective events (such as connectors and mechanical splices) and saturating the detector. The time from saturation until the detector recovers results in a distance that multiple, closely spaced, events cannot be detected or distinguished. This distance is called a dead zone. Selection of the parameter settings can affect the MQJ length that is needed. For instance, the smaller the pulse width used, the shorter the dead zone.

3.3 Dynamic Range. The maximum possible fiber length measured. The dynamic range is the difference between the backscatter level and the noise floor (or other specified noise level) and is depended upon the OTDR setting used such as the pulse width.

3.4 Event Dead Zone. The event dead zone is the minimum distance in which two consecutive unsaturated reflective events can be both observed (detected) and the loss of the second measured.

3.5 Fiber Interface. An optical port located on the OTDR configured as a single ferrule connector adapter to accept a single ferrule connector. For each wavelength of operation, the fiber interface may be on a separate plug-in module.

3.6 Fiber patch cords. An MQJ used as a dead zone cable and supplied with a different connector on the test cable end. This connector interfaces with the connector on cable assembly under test. At a minimum, the MQJ used for the dead zone cable should be at least twice the length of the attenuation dead zone specified for the module used. For use with an OTDR, this fiber patch cord is also referred to as the launch cable or launch fiber.

3.7 Measurement Quality Jumper (MQJ). The Measurement Quality Jumper (MQJ) is a low loss jumper that is used with test equipment to perform optical loss measurements. The MQJ must meet stringent optical loss requirements, IAW NAVEA Drawing 6877804, to ensure accuracy of measurements performed. Measurements must be accurate and repeatable. The accuracy and repeatability of the measurement is only as good as the MQJ. As the MQJ degrades with use, so does the measurement accuracy. The MQJ consists of a single fiber cable with a connector at one end which mates to the test equipment (OTDR or OTDR module) and a connector at the other end which mates to the link/segment under test.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

3.8 Optical fiber. An optical fiber is a thin cylindrical dielectric (non-conductive) waveguide used to send light energy for communication. Optical fibers consist of three parts: the core, the cladding, and the coating or buffer. The choice of optical fiber materials and fiber design depends on operating conditions and intended application.

3.9 Optical fiber, multimode. A multimode optical fiber is one that supports the propagation of more than one bound mode (electromagnetic wave).

3.10 Optical fiber, single mode. A small core optical fiber where one bounded electromagnetic wave of light will propagate at the wavelength of interest.

3.11 Optical return loss. This is the ratio of the reflected power, P_r , to the incident power, P_i , in the unit of measure of dB in a fiber optic system or link. The return loss is measured as a positive value. Although the ratio of reflected power to incident power is a fraction less than one, the minus sign in front of the equation for optical return loss makes the value calculated a positive quantity. The optical return loss is measured when two or more optical interfaces are in the fiber optic system or link.

3.12 Optical source (fiber optic light source). A device that emits radiation in or near the visible region of the electromagnetic spectrum, for example, light-emitting diodes (LED), laser diodes (LD), and lamps (broad spectrum), for providing optical power to optical measurement system/instrumentation.

3.13 Optical Time Domain Reflectometer (OTDR). A fiber optic test instrument that sends out pulses of light and measures the level and time delay of returning reflected and backscattered light. A trace of the optical path is displayed along with measurements (attenuation, distance and reflectance) for each event found. The OTDR is used for:

- a) Estimating the attenuation rate of a fiber.
- b) Identifying the nature and location of defects in an optical link.
- c) Estimating the length of an installed optical link.
- d) Estimating the reflectance at a connection and return loss at multiple connections.

3.14 Pulse Width. The amount of time that the laser is on versus off and light is injected from the OTDR into the fiber (time interval that the pulse lasts). A shorter pulse width is better for short cable runs and results in higher resolution, shorter dead zones, less dynamic range and more noise. A longer pulse width is better for longer cable runs and results in lower resolution, longer dead zones, more dynamic range and less noise.

3.15 Reflectance. This is the ratio of the reflected power, P_r , to the incident power, P_i , in the unit of measure of dB at a single fiber optic interface or at one reflection point. The reflectance is measured as a negative value since the log of the ratio of reflected power to incident power is a fraction less than one (a negative value).

3.16 Resolution. The ability of the OTDR to distinguish between two closely spaced events and is depended upon OTDR setting used such as the pulse width and the OTDR receiver noise floor.

3.17 Support equipment. Equipment that is required to maintain, test, or operate an item, or facility, in its intended environment. An OTDR is one piece of support equipment.

3.18 Termination, connector. The process performed for placing a connector, terminus, splice or other device at the end of an optical fiber. This placement optically minimizes leakage/losses and reflection. Terminations are used to join or connect two adjacent optical fiber ends or to terminate the fiber at either a source (electrical to optical conversion) or receiver (optical to electrical conversion) where the light leaves the optical fiber (waveguide) and continues in a non-waveguide mode of propagation.

3.19 Trace. The electronic signal over the optical path obtained with an Optical Time Domain Reflectometer (OTDR) or other type optical reflectometry instrument. This electronic signal is the unique signature or map for a fiber link or more than one link in series along the length of the optical path.

3.20 Two-point. The loss measured between any two events (reflective or non-reflective). This loss is expressed in units of dB.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

4 Requirements. The OTDR shall be capable of displaying the attenuation, distance and reflectance for each event, and the attenuation, distance and return loss after multiple events found along the optical path, referred to as a trace. Commonality compliance is that in which bounds or restricts the OTDR to those cited in this Standard Practice. Requirements for the OTDR with a configuration of A or B shall comply with 4.1 through 4.6, depending upon configuration being offered (see 4.7) and shall meet the applicable requirements listed in TABLE 6405-II. Verification of these requirements shall conform to the applicable column in TABLE 6405-II for configurations A and B. A more extensive set of requirements (including conformance to the environmental conditions in MIL-PRF-28800) that are applicable to configurations B does not apply to configuration.

4.1 Modules, standard. Standard modules shall consist of the multimode module and the single mode module and be supplied with the OTDR mainframe. Modules shall be interchangeable as plug-in module without need to disassemble mainframe. Each optical source in the module shall be restricted to containing a Class 1 Laser (per ANSI Z136.2).

4.1.1 Multimode module, PC polished.

4.1.1.1 Wavelength. The OTDR shall contain one plug in module with an optical source that supports the wavelengths of 1300 nm +30 nm and 850 nm + 30 nm @ 25 + 1°C

4.1.1.2 Pulse width. Shall be variable from 3ns to 300ns.

4.1.1.3 Fiber Interface. 62.5/125 µm fiber compatibility. The connector shall be protected with the attached protective cap.

4.1.1.4 Fiber Patch Cords. 3 meter high quality hybrid patch cords with loss of no more than 0.7 dB shall be provided for connecting from the OTDR connector to the following:

4.1.1.4.1 Connectors. ST

4.1.1.4.2 Bare Fiber. 50/125 µm and 62.5/125 µm.

4.1.1.5 Attenuation Dead Zone. 850 nm: ≤ 4 m; 1300 nm: ≤ 4 m (with shortest pulse width and a recovery to within 0.5 dB of linear backscatter for -40 dB reflectance)

4.1.1.6 Event Dead Zone. ≤ 1.0m (1.5 dB recovery from saturated Fresnel reflection)

4.1.2 Single mode module, PC polished.

4.1.2.1 Wavelength. 1310 nm ± 25 nm and 1550 nm ± 25 nm in one plug-in module.

4.1.2.2 Fiber Interface. 9/125 µm fiber compatibility. The connector shall be protected with the attached protective cap.

4.1.2.3 Fiber Patch Cords. 3 meter high quality hybrid patch cords with loss of no more than 0.7 dB shall be provided.

4.1.2.3.1 Connectors. ST.

4.1.2.3.2 Bare Fiber. 9/125 µm.

4.1.2.4 Attenuation Dead Zone. 1310 nm: 5m; 1550 nm: 5m (recovery to within 0.5 dB of linear backscatter for -40 dB reflectance).

4.1.2.5 Event Dead Zone. ≤ 1.0 m (1.5 dB recovery from saturated Fresnel reflection).

4.1.2.6 Return Loss

4.1.2.6.1 Operating wavelengths: 1310 nm and 1550 nm.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

4.1.2.6.2 Interface connection return loss shall be > 50 dB

4.1.2.6.3 Return loss range shall be 10 to 45 dB minimum with an interface connection as specified in 4.1.2.6.2.

4.1.2.6.4 Accuracy:

4.1.2.6.4.1 Detector accuracy: $< \pm 1.0$ dB. Note – This is for detector accuracy, not reflectance accuracy.

4.1.2.6.5 Open air verification measurement: Between 14.3 dB and 15.9 dB.

4.2 Modules, auxiliary. Auxiliary modules shall consist of the single mode APC polished module. This module shall be supplied separately, when required, rather than being supplied with the OTDR mainframe. The module shall be interchangeable as a plug-in module without need to disassemble the mainframe. Each optical source in the module shall be restricted to containing a Class 1 Laser (per ANSI Z136.2).

4.2.1 Single mode module, APC polished.

4.2.1.1 Wavelength. 1310 nm ± 25 nm and 1550 nm ± 25 nm in one plug-in module.

4.2.1.2 Fiber Interface. 9/125 μ m fiber compatibility. The connector shall be protected with the attached protective cap.

4.2.1.3 Fiber Patch Cords. 3 meter, high quality hybrid patch cords with loss of no more than 0.7 dB shall be provided.

4.2.1.3.1 Connectors. SC APC.

4.2.1.3.2 Bare Fiber. 9/125 μ m.

4.2.1.4 Attenuation Dead Zone. 1310 nm: 5m; 1550 nm: 5m (recovery to within 0.5 dB of linear backscatter for -60 dB reflectance).

4.2.1.5 Event Dead Zone. ≤ 1.0 m (1.5 dB recovery from saturated Fresnel reflection).

4.2.1.6 Return loss

4.2.1.6.1 Operating wavelengths: 1310 nm and 1550 nm.

4.2.1.6.2 Interface connection return loss shall be > 65 dB

4.2.1.6.3 Return loss range of 10 to 60 dB minimum with an interface connection return loss of > 65 dB

4.2.1.6.4 Accuracy:

4.2.1.6.4.1 Detector accuracy: $< \pm 1.0$ dB. Note – This is for detector accuracy, not reflectance accuracy.

4.2.1.6.5 Open air verification measurement: Between 14.3 dB and 15.9 dB.

4.3 High resolution OTDRs. High resolution OTDRs for multimode and/or single mode shall be either standalone units included with a mainframe or individual modules for use with existing approved mainframes. For module form factors, the modules shall be interchangeable as plug-in modules without the need to disassemble mainframe. Each optical source in the module shall be restricted to containing a Class 1 Laser (per ANSI Z136.2).

4.3.1 Multimode module, centimeter resolution, PC polished.

4.3.1.1 Wavelength. The OTDR shall contain one plug in module with an optical source that supports the wavelengths of 1300 nm ± 30 nm

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

4.3.1.2 Fiber Interface. 62.5/125 μ m fiber compatibility. The connector shall be protected with the attached protective cap.

4.3.1.3 Fiber Patch Cords. 3meter high quality hybrid patch cords with loss of no more than 0.7 dB shall be provided.

4.3.1.3.1 Connectors. ST.

4.3.1.3.2 Bare Fiber. 50/125 μ m and 62.5/125 μ m.

4.3.1.4 Spatial accuracy. Distance determined from the equipment optical interface port to break/fault shall be less than or equal to +/- 5 cm (+/- 1 cm preferred).

4.3.1.5 Event dead zone. Minimum distance that can distinguish between two breaks in the optical fiber shall be less than or equal to 1 cm. Operational need is to determine if there is a break at the back of terminus 1, the back of mating terminus 2, or a cracked/shattered fiber end face at a mated termini pair.

4.3.1.6 Point discontinuity loss accuracy. The apparent loss or gain measured at a point discontinuity shall be less than or equal to 0.5 dB (less than or equal to 0.1 dB preferred).

4.3.1.7 End-to-end length accuracy. The loss through a 500 meter optical fiber shall be measured to an accuracy of less than or equal to 1.0 dB.

4.3.1.8 Dynamic range. Ability to measure specified spatial accuracy and event dead zone in fiber optic cabling and components with an end-to-end optical loss of 15 dB or less through a total cable length (that can be segmented) of 500 meters or less.

4.3.1.9 Range of fiber length for specified resolution: 0 to 0.5 km.

4.3.1.10 Point loss resolution. The resolution of the apparent loss or gain at a point (such as at an optical splice) shall be less than or equal to 0.05 dB (less than or equal to 0.01 dB preferred).

4.3.2 Single mode module, centimeter resolution, PC polished.

4.3.2.1 Wavelength. 1310 nm \pm 25 nm and 1550 nm \pm 25 nm in one plug-in module

4.3.2.2 Fiber Interface. 9/125 μ m fiber compatibility. The connector shall be protected with the attached protective cap.

4.3.2.3 Fiber Patch Cords. 3 meter, high quality hybrid patch with loss of no more than 0.7 dB shall be provided.

4.3.2.3.1 Connectors. ST.

4.3.2.3.2 Bare Fiber. 9/125 μ m.

4.3.2.4 Spatial accuracy. Distance determined from the equipment optical interface port to break/fault shall be less than or equal to +/- 5 cm (+/- 1 cm preferred).

4.3.2.5 Event dead zone. Minimum distance that can distinguish between two breaks in the optical fiber shall be less than or equal to 1 cm. Operational need is to determine if there is a break at the back of terminus 1, the back of mating terminus 2, or a cracked/shattered fiber end face at a mated termini pair.

4.3.2.6 Point discontinuity loss accuracy. The apparent loss or gain measured at a point discontinuity shall be less than or equal to 0.5 dB (less than or equal to 0.1 dB preferred).

4.3.2.7 End-to-end length accuracy. The loss through a 500 meter optical fiber shall be measured to an accuracy of less than or equal to 1.0 dB.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

4.3.2.8 Dynamic range. Ability to measure specified spatial accuracy and event dead zone in fiber optic cabling and components with an end-to-end optical loss of 15 dB or less through a total cable length (that can be segmented) of 500 meters or less.

4.3.2.9 Range of fiber length for specified resolution: 0 to 0.5 km.

4.3.2.10 Point loss resolution. The resolution of the apparent loss or gain at a point (such as at an optical splice) shall be less than or equal to 0.05 dB (less than or equal to 0.01 dB preferred).

4.3.2.11 Return Loss

4.3.2.11.1 Operating wavelengths: 1310 nm and 1550 nm.

4.3.2.11.2 Interface connection with ORL > 50 dB: 10 to 45 dB minimum (for a UPC connection).

4.3.2.11.3 Accuracy:

4.3.2.11.3.1 Detector accuracy: $< \pm 1.0$ dB. Note – This is for detector accuracy, not reflectance accuracy.

4.3.2.11.4 Open air verification measurement: Between 14.3 dB and 15.9 dB.

4.4 Mainframe display.

4.4.1 Vertical Axis. Eight Divisions of attenuation/loss parameters.

4.4.1.1 Scale Factor. Min: 0.05 dB/div or less Max: 4.0 dB/div or more.

4.4.1.2 Dynamic Range.

4.4.1.2.1 850nm: ≥ 25 dB.

4.4.1.2.2 1300nm: ≥ 25 dB.

4.4.1.2.3 1310 nm: ≥ 30 dB.

4.4.1.2.4 1550 nm: ≥ 30 dB.

4.4.1.3 Resolution. ≤ 0.05 dB.

4.4.1.4 Measurement Modes. Loss between two points, loss by Least Square Approximation, loss per unit length.

4.4.2 Horizontal Axis. Ten divisions for distance measurement.

4.4.2.1 Range. Multimode: ≥ 2 km; Single Mode: ≥ 20 km.

4.4.2.2 Marker Accuracy. $\leq \pm (1.0 \text{ m} + 1.10^{-5} \times \text{distance})$.

4.4.2.3 Marker Resolution. ≤ 0.1 m on minimum scale

4.4.2.4 Index of Refraction.

4.4.2.4.1 Range. 1.4000 to 1.5999

4.4.2.4.2 Resolution. 0.0001.

4.4.3 Display format. Present Data in graphical and alphanumeric formats simultaneously on a high resolution color display.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

4.4.3.1 Graphical Format. Visual observation of fiber characteristics in dB on the vertical axis versus fiber distance in meters on the horizontal axis. The trace shall show the entire characteristic of a magnified portion of range.

4.4.3.2 Alphanumerical Format. Parameters shall be displayed: Date, title, distance range, horizontal scale, vertical scales, marker distance, pulse width, index of refraction, distance between markers, splice loss, horizontal trace start distance, optical wavelength, loss between markers, fiber loss (dB/km).

4.4.3.2.1 Annotation of Display. Additional alphanumeric data can be added to the display by the operator to add minimum of 36 consecutive alphanumerical characters.

4.4.3.2.2 Markers. At least two movable on-screen indicators capable of being positioned at any point on the graphical trace.

4.4.3.2.3 Attenuation/Loss Measurement.

4.4.3.2.3.1 Two point. Loss in dB between any two points

4.4.3.2.3.2 Least Squares Approximation.

4.4.3.2.3.3 Slope. Fiber loss per unit distance (dB/km)

4.4.3.2.4 Reflectance/return loss measurement.

4.4.3.2.4.1 Reflectance at each optical reflective interface.

4.4.3.2.4.2 Return loss at two or more reflective interfaces.

4.4.4 Signal Averaging. Noise reduction by sequential averaging of fiber signature trace. Parameters of the vertical axis and the horizontal axis shall be achieved within three minutes of signal averaging.

4.4.5 Environment. The information on display shall be legible as required in MIL-PRF-28800F in indoor and outdoor.

4.5 Mainframe Data Operations.

4.5.1 Test Result Management.

4.5.1.1 Test Result Storage. OTDR capable of storing at least 100 test results with graphical and alphanumerical data in nonvolatile memory.

4.5.1.2 Test Result Upload. Capable of uploading stored test results for analyzing and printing. The software for uploading, viewing and printing shall be provided.

4.5.1.3 Test Result Recall. Recall and display at least one trace for comparison with the displayed trace of the system under test.

4.5.2 Digital Interfaces.

4.5.2.1 Serial Port. Mainframe shall be provided with either a USB or RS-232 serial port for test result upload and interconnecting to an external printer, plotter, etc.

4.6 Mainframe General Requirements (non-measurement parameters).

4.6.1 Power.

4.6.1.1 Warm up time. The equipment warm up time shall not exceed 20 minutes.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

4.6.1.2 Internal DC battery. OTDR shall be capable of operating on either internal rechargeable or non-rechargeable batteries. Rechargeable batteries shall be provided for portable operation. For rechargeable batteries minimum operating time shall be at least 8 hours following a maximum recharge time of 14 hours. Non-rechargeable batteries shall be available from commercial market and the minimum operating time shall be at least 8 hours.

4.6.1.3 Battery Indicator. Low battery indicator shall be provided.

4.6.1.4 Battery Restriction. Applicable to configuration B only (see appendix A).

4.6.1.5 AC operation. External adapter provides DC to input jack. External adapter shall accept electrical power of 110/220 +10% @ 60 Hz single phase.

4.6.1.6 Auto power off. The OTDR shall have an automatic turn off feature. The feature shall be activated when the absence of keyboard activity exceeds a set interval (such as 5 to 15 minutes).

4.6.2 Calibration Interval. The calibration interval for the mainframe and each plug-in module shall be 12 months minimum. At the end of this interval, a minimum of 85% of the equipment shall remain in tolerance.

4.6.3 Calibration Procedure. The procedure, software, and special interfaces/ adapters that are needed for the equipment calibration shall be provided.

4.6.4 Physical features.

4.6.4.1 Dimensions. Portable, less than 9,000 cm³

4.6.4.2 Weight. The overall weight of the unit with one plug-in shall not exceed 4.5 kg (10 lb).

4.6.5 Environmental conditions. Applicable only to configuration A, C, D & E. Environmental conditions for configuration B are addressed in appendix A.

4.6.5.1 Operating temperature. 0°C to +45°C

4.6.5.2 Non-operating temperature. -20°C to +60°C

4.6.6 Wireless communication. Wireless communication shall be capable of being disabled by either hardware or software by manufacturer. Operator shall not have access to wireless functionality.

4.7 Accessories.

4.7.1 Protective caps and dust covers. Protective caps/dust covers for optical ports shall be provided.

4.7.2 Transit case.

4.7.2.1 MIL-STD-2042 (configuration A). A soft, protective case can be provided for transporting the OTDR, accessories, and at least the Operator's Manual.

4.7.2.2 Fleet Use (configuration B). A protective hard carrying case according to MIL-PRF-28800F shall be provided for transporting the OTDR. The transit case shall be capable to accommodate the OTDR, accessories, and at least the Operator's Manual.

4.7.3 Technical manual.

4.7.3.1 Technical manuals shall be provided. At a minimum, these technical manuals shall consist of a operators manual.

4.7.4 Training Materials. Applicable to configuration B only (see appendix A).

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

4.7.5 Identification plate. The OTDR identification plate shall be permanently affixed to the OTDR mainframe. The identification plate shall contain the following information:

Manufacturer name and/or cage:

Part or model number:

Serial number:

4.8 Configurations. See [TABLE 6405-I](#)

5. Performance. The OTDR shall be used by personnel to display a trace and measure attenuation, distance and reflectance in single mode and in multimode, fiber optic cabling systems for determining conformance to MIL-STD-2042. The requirements and means to show compliance (means of verification) with these requirements shall conform to TABLE 6405-II or TABLE 6405 A-I.

5.1 Compliance verified.

5.1.1 Configuration A. Once compliance of the OTDR to the performance requirements for configuration A is verified, the OTDR shall be listed on the NSWC DD Approved Test Equipment List.

5.1.2 Configuration B. Once compliance of the OTDR to the performance requirements for configuration B is verified, Naval Inventory Control Point Mechanicsburg (NAVICP) shall take the measures necessary for inclusion into the Government National Stock System.

5.1.3 Configurations C, D, E. Once compliance of an auxiliary module or standalone unit to the performance requirements for applicable configuration (C, D or E) is verified, the equipment shall be listed on the NSWC DD Approved Test Equipment List.

5.2 Compliance test facility.

5.2.1 Configuration A. Application for OTDR verification compliance to configuration A shall be submitted to NSWC DD by e-mail to NSWC DD Warfare Systems Department at DLGR_NSWC_W_FO_ENG@navy.mil. NSWC DD shall be the Government entity responsible for performing the testing to determine compliance to the performance requirements.

5.2.2 Configuration B. Requests for candidate submission and selection of the most suitable candidate for inclusion into the Government National Stock system (for configuration B) shall be performed by the Naval Inventory Control Point Mechanicsburg (NAVICP). NAVICP has Naval Research Laboratory (NRL) do the testing to determine conformance to performance requirements. Method of verification shall be determined by NRL.

5.2.3 Configurations C, D, E. Application for auxiliary module or standalone unit verification compliance to applicable configuration C, D or E shall be submitted to NSWC DD by e-mail to NSWC DD Warfare Systems Department at DLGR_NSWC_W_FO_ENG@navy.mil. NSWC DD shall be the Government entity responsible for performing the testing to determine compliance to the performance requirements.

6. Notes.

6.1 Intended use. The OTDR is intended to be used for measuring attenuation, distance and reflectance in fiber optic cables and systems for determining conformance to MIL-STD-2042 and troubleshooting.

6.2 Requirement point of contact. Inquiries concerning the requirements listed for fiber optic test equipment for Navy shipboard applications should be addressed to DLGR_NSWC_W_FO_ENG@navy.mil.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

APPENDIX A

OTDR CONFIGURATION FOR FLEET USE

A.1 Intent. The OTDR configuration specified in this appendix has more extensive set of requirements (such as environmental conditions) than the OTDR configurations specified in Requirement 6405. This configuration, referred to as configuration B is intended for Fleet (military) use. This configuration is for use by military personnel in Navy shipboard, submarine, and shore applications. Configuration A, C, D & E, is not covered by this appendix and is for use by civilian personnel both in the Government and for contractors providing optical loss, distance to a break/fault and return loss testing services to the Government.

A.2. Applicable documents.

A.2.1 General. The documents listed in this section are specified in sections A.3, A.4, and A.5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections A.3, A.4, and A.5 of this standard practice, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE STANDARD

- | | | |
|--------------------------------|---|--|
| MIL-STD-1678-6 | - | Fiber Optic Cabling Systems Requirements and Measurements (Part 6: Parts and Support Equipment Commonality and Standardization Requirements, Cable Harness Configurations) (Part 6 of 6 Parts) |
| MIL-PRF-28800 | - | Test equipment for use with electrical and electronic equipment, general specification for |

(Copies of these documents are available online at <https://quicksearch.dla.mil/> or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

A.2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

A.3. Definitions. Definitions for terms used in this appendix can be found in paragraph 3 of Requirement 6405.

A.4. Requirements. The OTDR shall be capable of displaying the attenuation, distance and reflectance for each event and the attenuation, distance and return loss after multiple events found along the optical path, referred to as a trace. Commonality compliance is that in which bounds or restricts the OTDR to those cited in this Standard Practice. Requirements for the OTDR shall comply with 4.1 through 4.6 and with this appendix A.4.1 and A.4.2. The requirements and methods to verify these requirements shall conform to TABLE 6405 A-I for configuration B. Constraints on verification and for conformance to the environmental conditions in MIL-PRF-28800 are listed in A.5.1.

A.4.1 Power. In addition to those requirements specified in 4.5.1, the OTDR shall meet the requirements of A.4.1.1.

A.4.1.1 Lithium batteries. Per MIL-PRF-28800F, lithium batteries are prohibited without prior authorization. Requests for approving the use of lithium batteries, including those encapsulated in integrated circuits, shall be submitted to the procuring activity at the time of submission of proposals. Approval shall apply only to the specific model proposed. Proposed lithium cells/batteries shall be constrained to those requirements specified in MIL-STD-1678-6 Requirement 6404. Reporting and design requirements for lithium batteries shall conform to MIL-STD-1678-6 Requirement 6404.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6405

APPENDIX A

A.4.2 Accessories. In addition to those requirements specified in 4.6, the OTDR shall meet the requirements of A.4.2.1 through A.4.2.3.

A.4.2.1 Technical manual. Technical manuals shall conform to MIL-PRF-28800. A Use and Installation manual (Operator's Manual) shall be provided separately. Maintenance and Servicing manual shall be provided with all three levels of maintenance; unit operational verification, module level, and component level. The technical manual shall be provided in both printed and electronic formats. The printed format shall be otherwise normally provided. The electronic format shall consist of the installation programs for the latest version of Adobe Acrobat for all computer platforms for which Acrobat is available and the technical manual in an electronic form that is readable through use of the Adobe Acrobat application. A statement of copy right release for reproduction of technical manual for government use shall be printed in the first two pages of each technical manual. A statement of copy right release for reproduction of technical manual CD for government use shall be printed on each CD.

A.4.2.2 Training material. Training material that demonstrates the features, basic operations and procedures with step-by-step instructions for using the equipment as an OTDR shall be provided. The material can be either on a CD with an interactive feature or in a technical manual format.

A.4.2.3 Identification plate. As per MIL-PRF-28800, the OTDR identification plate shall be permanently affixed to two places on the OTDR mainframe and in front of the transit case. The identification plate shall contain the following information:

Manufacturer name and/or cage:

Part or model number:

Serial number:

National stock number:

Contract Number:

Military nomenclature or "Part of":

TABLE 6405 A-I. OTDR list of requirements and verification methods, for Fleet use (configuration B).

1/ Perform per MIL-PRF-28800 table 2 except as specified in paragraph A.5.1 herein.	
2/ Perform on OTDR outside (without) the transit case per MIL-PRF-28800 table 2 (see A.5.1 herein).	

A.5 Verification. Unless otherwise specified, the performance requirements of 4.1 through 4.6 and appendix A sections A.4.1 and A.4.2 shall comply with the verifications for the Fleet use configuration (see Appendix A, table 6405 A-I) with the additional requirements and constraints specified in A.5.1. These requirements and constraints for configuration B includes conformance to the environmental conditions in MIL-PRF-28800 (see TABLE 6405 A-I). Requests for candidate submission and selection of the most suitable candidate for inclusion into the Government National Stock system (configuration B) shall be performed the Naval Inventory Control Point Mechanicsburg (NAVICP). NAVICP has the Naval Research Laboratory (NRL) do the testing to determine conformance to performance requirements. Method of verification shall be determined by NRL.

A.5.1 Environmental conditions. The OTDR shall be verified to meet the requirements of MIL-PRF-28800 class 3 for Navy shipboard, submarine, and shore applications, as specified in TABLE 6405 A-I with the following exceptions:

- a. The OTDR shall withstand a non-operating temperature requirement limited to the range of -20°C to +60°C at a non- condensing RH up to 95%.
- b. The OTDR shall be sealed against dirt/humidity. Both the relative humidity test and the dust resistance test shall be performed with the OTDR outside the transit case.
- c. The OTDR shall be ruggedized to accommodate minor impacts. The transit drop test shall be performed both with the OTDR in a hard transit case and with the OTDR outside the transit case (i.e., the equipment class where the OTDR enclosure is intended to act as the transit case). The bench handling test shall be performed on the OTDR outside the transit case.
- d. The OTDR shall withstand an operating temperature requirement of -10C to +50C.
- e. The OTDR shall be verified to meet EMC requirements without the electrostatic discharge immunity requirement.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6406

EPOXY CURING OVEN INTERFACE REQUIREMENTS WITH EVALUATION CRITERIA

1. Purpose: The criteria for interface requirements with the process to verify epoxy curing oven temperature and process support is specified herein. These criteria are applied when there is an activity/vendor pursuing approval for the use of an alternate epoxy curing oven that is currently specified in MIL-STD-2042. These interface requirements and verification process apply only to an epoxy curing oven for a single step (temperature) cure that is compatible with the epoxy curing process and cure temperature specified in MIL-STD-2042.

1.1 Current constraint. In accordance with MIL-STD-2042, equivalent curing ovens may be used if authorized approval is obtained.

1.2 Objective. The objective is to use an oven that sufficiently cures epoxy following to support the polishing process documented in MIL-STD-2042 and to the extent of not affecting optical performance during environmental exposures (such as temperature, vibration, shock) as is obtained with the MIL-STD-2042 polishing process.

1.3 Supplemental, item number. Item numbers 6204DM through 6204DQ are assigned to the single step curing oven and its components (heater block, cable stand post, cable stand ring, cable clamps) are found in Requirement 6204. For Navy Shipboard applications, approved curing oven and its components are found in the Navy Shipboard Fiber Optic Recommended Tool List (see 2.2.2) also.

2. Applicable documents.

2.1 General. The documents listed in this section are specified in sections 3, 4, and 5 of this standard practice. This section does not include documents cited in other sections of this standard practice or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, and 5 of this standard practice, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

- [MIL-PRF-29504](#) - Termini, Fiber Optic Connector, Removable, General Specification for

2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. Definitions.

3.1 Connector, fiber optic. A device that permits repeated mating and couples the optical power between two optical fibers or two groups of optical fibers. A fiber optic connector must maintain fiber alignment without significant loss of optical power.

3.2 Ferrule end face. Surface of the ferrule used to make contact with the mating ferrule and/or the mating fiber. This surface is perpendicular to the longitudinal axis of the optical fiber.

3.3 Termination, connector. The process performed for placing a connector, terminus, splice or other device at the end of an optical fiber. This placement optically minimizes leakage/losses and reflection. Terminations are used to join or connect two adjacent optical fiber ends or to terminate the fiber at either a source (electrical to optical conversion) or receiver (optical to electrical conversion) where the light leaves the optical fiber (waveguide) and continues in a non-waveguide mode of propagation.

3.4 Termini. A component used in a fiber optic, multiple termini, connection that is inserted into one of the insert cavity of a multiple termini connector and terminated onto the end of a simplex, fiber optic cable. Termini is the plural form for the word terminus.

3.5 Terminus. This term is the singular form for the word termini.

4. Requirements. The requesting activity or vendor (see 6.2) shall be capable of demonstrating that use of a specific curing oven shall meet the actions cited in [TABLE 6406-II](#).

4.1 Work instructions. Work instructions (see 6.2.3) shall include the information in 4.1.1 through 4.1.4.

4.1.1 Applicability. All termini/connector types shall be identified.

4.1.2 Techniques. Information on operation and lessons learned for use with the curing oven shall be included. The techniques used shall be stated to minimize the variation in cure temperature during the curing process.

4.1.3 Cure Steps. The steps performed during the curing process shall be provided and align with MIL-STD-2042 methods.

4.1.3.1 Curing oven Parameters. Details within each step shall include temperature settings and values for other critical parameters. Details can be provided in a tabular format.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6406

4.1.3.2 Current Tooling Compatibility. Details within each step shall include compatibility with approved curing (heater) blocks and cure adapters by connector/termini type. Compatible curing (heater) blocks and cure adapters are critical to ensure the epoxy is subjected to the appropriate cure schedule. Variations of each step shall be included that accounts for different termini/connector types.

4.1.4 Approval. Work instructions are approved once step 2 in [TABLE 6406-II](#) is completed.

4.2 Curing oven Operating Temperature. Curing oven shall be capable of meeting specified operating conditions when temperature verifications are performed.

4.2.1 Operating Temperature. Cure temperature shall be 120 °C +/- 2 °C at all measurement points for the duration of the measurement period. After the curing oven has completed a 'warm-up' period of at least 30min, temperature measurements shall be taken for a period not less than 30min. at each verification point (see 4.2.1.3) using the specified thermocouple assembly (see 4.2.1.1) placed within the connector/termini (see 4.2.1.2 and [TABLE 6406-III](#)).

4.2.1.1 Thermocouple assembly. The thermocouple assembly shall consist of parts listed in [TABLE 6406-I](#). The furcation tubing shall have an inner diameter such that the thermocouple can be placed inside the furcation tubing and have an outer diameter such that the completed thermocouple assembly may be placed into a connector or termini where a 900um buffered fiber would normally be placed. The furcation tubing shall be placed over the thermocouple such that the thermocouple is aligned with, but does not extend past (not exposed), the end of the furcation tubing. The furcation tubing shall be installed prior to placing the thermocouple into the connector/termini. The furcation tubing is intended to provide protection for the thermocouple, provide consistency in thermocouple positioning.

TABLE 6406-I. Thermocouple Assembly

Description	Part Number
Fine wire thermocouple	Omega 5TC-TT-J-40-36 (or equal)
Furcation Tubing (OD: 900um, ID: 650um)	Connective Solutions MFC2.4-650/900LSZH (or equal) <u>1/</u>

1/ Part number is for furcation tubing which contains inner buffer tube required for thermocouple assembly.

4.2.1.2 Thermocouple assembly placement within connector/termini. The thermocouple assembly shall be inserted into the rear body (fiber entry end) of the connector or termini, so that the thermocouple and furcation tubing enter the 'cone' region at the rear of the ferrule. There is no need to epoxy the thermocouple within the connector/termini.

4.2.1.3 Thermocouple placement within curing block. Connectors and termini as identified in [TABLE 6406-III](#) shall be placed in curing block positions as specified in 4.2.1.2 and shown in [figure 6406-1](#). Each set of connectors in [TABLE 6406-III](#) shall be verified for temperature compliance within the curing oven. It should be verified that after the connector/termini is placed into the oven location that the thermocouple assembly is still fully seated (bottomed) within the connector/termini. A representative curing block is shown in [figure 6406-1](#). At a minimum, measurement at five curing block positions shall include three positions closest to each of three corners and one position closest to the center.

4.3 Termination. Except for use of the alternate oven, termination of the test samples identified in [TABLE 6406-III](#) shall be performed in accordance with MIL-STD-2042.

4.3.1 Test sample configuration (terminated cable assembly). Connectors shall be terminated onto the ends of MIL-PRF-84045/16 to comprise the terminated cable assembly once step 4 in [TABLE 6406-II](#) is completed. Connectors to be placed on each end of the MIL-PRF-85045/16 cable shall be those listed in [TABLE 6406-III](#). Specific cable type used (i.e., either MIL-PRF-85045/16-01 or MIL-PRF-85045/16-02) shall conform to [TABLE 6406-III](#).

4.4 Applicable connector/terminus types. Connectors/termini used (in [TABLE 6406-II](#) and [TABLE 6406-IV](#)) may be tailored by the approving activity depending upon the connector/terminus types to be covered under the polishing process submitted for approval.

MIL-STD-1678-6A
w/CHANGE 1

REQUIREMENT 6406

5. Verification. Verifications shall consist of those submittals by the requesting activity ([TABLE 6406-II](#) steps 1 and 3) and those actions performed by the Approving Activity ([TABLE 6406-II](#) steps 2, 4 through 7) and as further detailed in 5.1 through 5.5.

5.1 Proposal. The request to use an alternate curing oven shall be prepared as a proposal. This proposal shall include information on the curing oven and intended use or customer.

5.2 Work instructions. Review shall include compliance with [TABLE 6406-II](#) and 4.1 (see 6.2.3).

5.3 Curing oven Temperature verification. Review shall include compliance with [TABLE 6406-II](#) and 4.2.

5.4 Post cure termination verification. Successful termination shall be performed per 4.3 using methods in MIL-STD-2042.

5.5 Post polished measurements. Measurements shall be performed as listed in 5.5.a through e.

- a. Measurement for visual inspection: MIL-STD-1678-3 Requirement 3105 with note 3/ of [TABLE 6406-II](#).
- b. Measurement for optical insertion loss: MIL-STD-1678-2 Requirement 2101 with note 4/ of [TABLE 6406-II](#).
- c. Measurement for optical return loss: MIL-STD-1678-2 Requirement 2105 with note 5/ of [TABLE 6406-II](#).
- d. Measurement for end face geometry: MIL-STD-1678-5 Requirement 5201 with note 6/ of [TABLE 6406-II](#).

6. Notes.

6.1 Intents behind standardization efforts.

6.1.1 Multiple party testing considerations. The incentive to minimize test variables, resulting in a level playing field for multiple parties testing, leads the Government to establish a baseline. This baseline includes considerations for fabrication of test samples, methods to verify actions/measurements and use of specific test practices in addition to specifics for test sample configurations.

6.2 Requesting and approving parties.

6.2.1 Approving activity. Naval Surface Warfare Center Dahlgren Division (NSWC DD) is the approving activity for approval to use an alternate curing oven as specified in Requirement 6406.

6.2.2 Requesting activity. Activity or vendor that is under consideration for approval to use an alternate curing oven. Consideration for approval is based on demonstrating compliance as specified in Requirement 6406.

6.2.3 Work instruction. Work instructions may be in the form of an operating manual, information sheet or other format and must include the contents listed in 4.1.1 through 4.1.4. If in digital format, content shall be provided in a Microsoft Word file or in a PDF file. Also, compatibility verification of curing (heater) blocks and cure adapters with currently approved curing ovens must be provided either as part of the work instructions or as separate documentation.
