## DEPARTMENT OF DEFENSE INTERFACE STANDARD

## ELECTRONIC COMPONENT CASE OUTLINES

## MIL-STD-1835D

## FOREWORD

1. This standard is approved for use by all Departments and Agencies of the Department of Defense (DoD).
2. The Department of Defense is committed to identifying and using standard electronic parts at reasonable cost and highest reliability. The electronic component case outline is important in this context, and must be selected with this objective in mind.
3. Significant changes have occurred in the design, manufacturer, and variety of electronic device encapsulation and attachment methods. These changes are reflected in this standard with new and revised case outlines.
4. Before the publication of this standard, electronic case outlines were listed in appendix C to MIL-M-38510.
5. Comments, suggestions, or questions on this document should be addressed to Commander, Defense Supply Center Columbus ATTN: DSCC-VA, P O Box 3990, Columbus, OH 43218-3990 or emailed to STD1835@dscc.dla.mil. Since contact information can change, you may want to verify the currency of this address information using the ASSIST Online database at www.dodssp.daps.mil.

## MIL-STD-1835D

## 1. SCOPE

1.1 Scope. This standard establishes and maintains a compilation of electronic component case outlines and should be useful to all levels of manufacturing that culminate in the production of reliable and logistically supportable electronic equipment.
1.2 Purpose. The purpose of this standard is to assure complete mechanical interchangeability of all electronic component case outlines of a particular style and type, regardless of source, commensurate with the requirements of high density electronic equipment manufacturing.
1.2.1 Tailoring. Some tailoring of case outlines is to be accomplished by users of this standard. Details for tailoring are presented with each style of case outline (when required, see 3.1.3 and 6.2).
1.2.2 Classification. Electronic component case outlines are of the styles and types identified in accordance with the descriptive designation system used herein (see 4.7). A cross-reference is included in section 6 indicating the relationship between old designations from MIL-M-38510 appendix $C$ and the new designations used herein.
1.2.3 Component case outline presentation. All case outlines presented in this standard are drawn in orthogonal projections. Dimensions are as shown, presented in both inch and metric units of measurement. The dimensions are labeled with the symbols listed in 3.1.25 herein. The drawings are intended only as illustrations of a case outline style. In some instances, the drawings show added detail for emphasis; in most instances, the drawings are distorted by intent.

## MIL-STD-1835D

## 2. APPLICABLE DOCUMENTS

2.1 General. The documents listed in this section are specified in sections 3 , 4, and 5 of this standard. This section does not include documents cited in other sections of this standard or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements documents cited in sections 3,4 , and 5 of this standard, whether or not they are listed.

### 2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS
MIL-M-38510 - Microcircuits, General Specification for.
MIL-PRF-38534 - Hybrid Microcircuits, General Specification for.
MIL-PRF-38535 - Integrated Circuits (Microcircuits) Manufacturing, General Specification for.
(Copies of these documents are available online at http://assist.daps.dla.mil;quicksearch/ or www.dodssp.daps.mil or from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 191115094.)
2.3 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)
ASME Y14.5M - Dimensioning and Tolerancing. (DoD adopted)
(Copies of these documents are available from www.asme.org or ASME, 3 Park Avenue, New York, NY 10016.)
ELECTRONIC INDUSTRIES ALLIANCE (EIA)
JEDEC Publication 95 - Registered and Standard Outlines for Solid State and Related Products.
(Copies of this document are available online at www.jedec.org/ or from the Electronics Industries Alliance, 2500 Wilson Boulevard, Arlington, VA 22201-3834).
2.4 Order of precedence. In the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

## MIL-STD-1835D

## 3. DEFINITIONS

3.1 Definitions. For the purpose of this standard, the definitions contained in the DoD specifications and standards referenced in 2.2.1, and other DoD specifications and standards as applicable, should apply. The following definitions should also apply.
3.1.1 Electronic device case outline (package). The embodiment of the external geometric characteristics of a electronic device including dimensions and dimensional tolerances. Hereafter, the case outline will be referred to as a package.
3.1.2 Configuration. The relative disposition of the external elements of a package including lead form.
3.1.3 Package style. All packages whose generic design and nomenclature are identical.
3.1.4 Package type. A package with a unique case outline, configuration, materials (including bonding wire and die attach), piece parts (excluding preforms which differ only in size), and assembly processes. 1/
3.1.5 Chip carrier (CC) package. A rectangular or square package having terminals on all four sides of the package periphery.
3.1.6 Can package. A cylindrical shaped package with leads attached to one end.
3.1.7 In-line package (IP). A rectangular package having one row (or two or more parallel rows) of terminals oriented perpendicular to the package seating plane.
3.1.8 Flat package (FP). A rectangular or square package with leads parallel to base plane attached on two opposing sides of the package periphery.
3.1.9 Grid array (GA) package. A rectangular or square package with terminals attached perpendicular to a "major surface" in a grid matrix.
3.1.10 Index. A unique mechanical or visual (or both) package feature which (using package orientation rules in accordance with JEDEC Publication 95) identifies the location of the first terminal position, (e.g., reference mark, extended terminal, chamfer, tab, notch, flat, groove, etc.). The index location varies with different package styles, but only as specified herein.
3.1.11 Index area. The area in which all or a portion of the index must be located.
3.1.12 Base plane. The reference plane, parallel to the nominal seating plane, through the lowest plane on the body of a package.
3.1.13 Seating plane. The reference plane which designates the interface of the package terminals with the mounting surface to which the terminals are attached, (for DIP's, see 5.2.4).
3.1.14 Coplanarity. Coplanarity is the condition of two or more surfaces having all elements in one plane, (e.g., the seating plane of all the leads on a electronic device, see 5.2.7).

[^0]
## MIL-STD-1835D

3.1.15 Dimension. A numerical value expressed in appropriate units of measure and indicated on a drawing and in other documents along with lines, symbols, and notes to define the size or geometric characteristic, or both, of a part or part feature. 2/
3.1.16 Reference dimension. A dimension, usually without tolerance, used for information purposes only. It is considered auxiliary information and does not govern production or inspection operations. A reference dimension is a repeat of a dimension or is derived from other values shown on the drawing or on related drawings. 2/
3.1.17 Basic dimension (BSC). A numerical value used to describe the theoretically exact size, profile, orientation, or location of a feature or datum target. It is the basis from which permissible variations are established by tolerances on other dimensions, in notes, or in feature control frames. 2/
3.1.18 True position. The theoretically exact location of a point, line, or plane of a feature established by basic dimensions in relationship with a datum reference(s) or other feature. 2
3.1.19 Datum. A theoretically exact point, axis, or plane derived from the true geometric counterpart of a specified datum feature. A datum is the origin from which the location or geometric characteristics of features of a part are established. 2/
3.1.20 Land. A portion of a conductive pattern usually, but not exclusively, used for the connection, or attachment, or both of components.
3.1.21 Land pattern. A combination of lands intended for the mounting and interconnection of a particular component.
3.1.22 Lead position overlay. An optical gauge used to measure lead dimensions, land pattern, and other package feature-relating requirements.
3.1.23 Cavity-up, cavity-down. The orientation of the package body cavity opening, away from the seating plane for cavity-up or toward the seating plane for cavity-down (see 5.2.8).
3.1.24 Tailoring. The process by which package requirements are evaluated to determine the extent to which they are most suitable for military systems and equipment applications; and modified as permitted by this standard, and as necessary to ensure application suitability (see 6.2).

[^1]
## MIL-STD-1835D

3.1.25 Dimensioning symbols. The dimensioning symbols used are as follows:

A: Body dimensions.
$\varnothing \mathrm{b}$ : Terminal lead diameters.
b: Terminal lead widths.
c: Terminal lead thicknesses.
$\varnothing \mathrm{D}$ : Body diameters.
D: Body lengths.
E: Body widths.
e: Terminal lead spacing.
F: Flange dimensions.
k : Index dimensions, length.
L : Terminal lead lengths.
Q: Standoff height. The height from the seating plane to the base plane or a reference plane parallel to the seating plane.
S: Distance between terminal leads and the body end or body center lines.
$\alpha$ : Angular dimensions.
h: Chamfered corner dimension.
R: Radius Dimensions.

- Straightness.
$\square$ : Flatness.
ค : Profile of a line.Profile of a surface.
$\perp$ : Perpendicularity.
$\phi \quad: \quad$ Position.
(1) : At maximum material condition.: At least material condition.
(D) : Projected tolerance zone.
$\varnothing$ : Diameter.: Basic dimension.
REF : Reference dimension.
$\triangle-\bar{A}:$ Datum feature.

## MIL-STD-1835D

## 4. GENERAL REQUIREMENTS

4.1 Package design. Package design shall be in accordance with this standard.
4.2 Package terminal identification. Package terminal identification shall be in accordance with the applicable device specification.
4.3 Package index implementation. A permanent index shall be clearly visible on the top and, as an added option, bottom of a package. The index shall be used for locating terminal 1. The location of the index shall be as specified in the outline requirements for each package style (see table VI).
4.4 Package dimensions and symbols. The package dimensions shall be in accordance with this standard. All dimensions shall apply to assembled sealed packages. Symbols and tolerances shall be interpreted in accordance with ASME Y14.5M-1994 and this standard. Unless otherwise specified, the package design controlling dimension shall be the inch. For all new package designs after January 1, 1992, it shall be metric.
4.5 Dimension verification. Unless otherwise specified, dimensions identified by a single symbol, which are repeated at more than 15 package locations may be verified by measurement at 15 randomly selected locations on the package. All package dimensions may be verified using calibrated gauges, overlays, or other comparative dimension verification devices. These devices shall be designed to the limits of size and relative location of package features. These devices and their application shall be subject to the approval of the qualifying activity. Recorded variables data for out of tolerance package features shall be available for review by the qualifying activity.
4.6 Package material characteristics. Package material characteristics, including internal elements that contribute to the uniqueness of a package type, shall be in accordance with the requirements of the device specification.
4.7 Package descriptive designation system. This standard uses a descriptive designation system to communicate package identification (see figure 1). This system describes materials, terminal location, case outline style, lead form, terminal count, and options. A type designator has been constructed, using this system, for all packages in this standard (see tables VI and VII). The type designators for packages selected from this standard shall be referenced in applicable detail specifications. See the example on figure 2.
4.7.1 Case outline letter/Part or Identifying Number (PIN) designator. The PIN case outline letter designator shall be as specified herein and shall be referenced in applicable device specifications. The case outline designator may include numbers or letters with the following limitations:
a. The letters "I" and "O" shall not be used.
b. The numbers " 0 ", and " 1 " shall not be used.
c. The letters $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, \mathrm{U}, \mathrm{T}, \mathrm{M}, \mathrm{N}$, and the numbers $4,5,6,7$, and 8 are undedicated "wildcards"; they may be used repeatedly, but only one time in a single device specification, see the example using the letter " X " on figure 2.
d. Blank spaces are not permitted.
4.8 Inactive for new design. The packages in table VII are inactive for new design. They are acceptable only for use in equipment designed or redesigned on or before the date indicated in the applicable footnote in table VII.

## MIL-STD-1835D

FIGURE 1. Package descriptive designation system.

TABLE I. Predominant package body material prefixes.

| Code | Material |
| :---: | :--- |
| C | Cofired ceramic, metal-seal |
| G | Ceramic, glass-seal |
| L | Glass |
| M | Metal |
| X | Other |

TABLE II. Terminal location prefixes.

| Code | Name | Location |
| :---: | :---: | :--- |
| A | Axial | $\begin{array}{l}\text { Terminals extend from one end in the direction of the major axis of a } \\ \text { cylindrical or elliptical package. }\end{array}$ |
| B | Bottom | Terminals beneath the seating plane of the package. |
| D | Dual | $\begin{array}{l}\text { Terminals in two parallel rows oriented perpendicular or parallel to } \\ \text { the seating plane. }\end{array}$ |
| M | Matrix | $\begin{array}{l}\text { Terminals in 3 or more rows and columns oriented perpendicular to } \\ \text { the seating plane, parallel to each other. }\end{array}$ |
| Q | Quad | $\begin{array}{l}\text { Terminals on all four sides of a square or rectangular package, } \\ \text { orientated perpendicular or parallel to the seating plane. }\end{array}$ |
| S | Single | $\begin{array}{l}\text { Terminals are on one surface of a square or rectangular package in } \\ \text { a single row. }\end{array}$ |
| X | Other | $\begin{array}{l}\text { Terminal location other than those described (see table V footnotes). } \\ \hline \text { Z }\end{array}$ Zig-zag | \(\left.\begin{array}{l}Terminals in two parallel rows oriented perpendicular to the seating <br>

plan arranged in a staggered configuration. Restrict to ZIP family.\end{array}\right]\).

TABLE III. Package outline style codes.

| Code 1/ | Style |
| :---: | :--- |
| CC | Chip-carrier package, square or rectangular body profile |
| CY | Cylinder or can package, round body profile |
| FM | Flange mount package, variable body profile |
| FP | Flat pack package, square or rectangular body profile |
| GA | Grid-array package, square or rectangular body profile |
| IP | In-line package, rectangular body profile (e.g., DIP/SIP/ZIP) |
| SS | Special-shape package |

1/ The package outline style will be followed with a suffix number when additional differentiation is required.

MIL-STD-1835D

TABLE IV. Lead-form (or terminal shape) suffixes.

| Code | Form/shape | Description |
| :---: | :---: | :---: |
| F | Flat | A nonformed flat (nonround) lead extending parallel to the seating plane. |
| G | Gullwing | The "gullwing" lead is shaped as follows: |
| J | "J" bend | The "J" lead is shaped as follows: |
| N | No lead | Metallized terminal pads located on the body of the package. |
| P | Pin/Peg | A tempered lead extending from the body of the package and intended for attachment to a plated through-hole in the land structure. |
| T | Through hole | A straight lead extending perpendicular to the seating plane. |
| U | "J" reversed | The reversed "J" lead is shaped as follows: |
| X | Other | A lead form or terminal shape other than those defined. |

MIL-STD-1835D

TABLE V. Package design options

| Code | Options 1// |
| :---: | :--- |
| A | Additional terminal pads added on the top of leadless <br> chip carrier style packages. |
| B | Cofired metal heat conduction pads; as specified <br> herein or in the applicable military detail specification. |
| C | Cavity up |
| D | Cavity down |
| E | Window lid |
| G, H, K, L | Other; as specified in the applicable military detail <br> specification. |

1/ When option letters $\mathrm{G}, \mathrm{H}, \mathrm{K}$, or L are used, they delineate packages that are the same style and terminal count but not the same in other ways such as dimension variations, terminal location within a GA matrix, or any package terminal attachment positions other than as specified herein.

MIL-STD-1835D

## 1. SCOPE

1.1 Scope. This drawing documents two product assurance class levels consisting of high reliability (device classes $Q$ and $M$ ) and space application (device class V). A choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). When available, a choice of Radiation Hardness Assurance (RHA) levels are reflected in the PIN.
1.2 PIN. The PIN is as shown in the following example:

1.2.1 RHA designator. Device classes $Q$ and V RHA marked devices meet the MIL-PRF-38535 specified RHA levels and are marked with the appropriate RHA designator. Device class M RHA marked devices meet the MIL-PRF-38535, appendix A specified RHA levels and are marked with the appropriate RHA designator. A dash (-) indicates a non-RHA device.
1.2.2 Device type(s). The device type(s) identify the circuit function as follows:

| Device type | Generic number | Circuit function |
| :---: | :---: | :---: |
| 01 | $X X X X X$ | $X X X X X X X X X X X X X X X X$ |

1.2.3 Device class designator. The device class designator is a single letter identifying the product assurance level as follows:

Device class
Device requirements documentation
M Vendor self-certification to the requirements for MIL-STD-883 compliant, non-JAN class level B microcircuits in accordance with MIL-PRF-38535, appendix A

Q or V Certification and qualification to MIL-PRF-38535
1.2.4 Case outline(s). The case outline(s) are as designated in MIL-STD-1835 and as follows:

| Outline letter |  | Descriptive designator |  | Terminals |
| :---: | :--- | :--- | :--- | :--- |

1.2.5 Lead finish. The lead finish is as specified in MIL-PRF-38535 for device classes $Q$ and $V$ or MIL-PRF-38535, appendix $A$ for device class M.

FIGURE 2. Example of a (scope) page from a device specification showing the identification/specification of case outlines (packages).

MIL-STD-1835D
TABLE VI. Package case outline list.

| Descriptive package type designator | Case outline letter | Requirement number, Configuration letter |  | 1/ <br> Dimensions <br> reference <br> letter | $\begin{array}{r} \underline{2} / \\ \begin{array}{c} \theta \mathrm{cc} \\ \left({ }^{\circ} \mathrm{C} / \mathrm{W}\right) \end{array} \end{array}$ | ```Terminal count, Row-to-row spacing (inch)``` | Terminal pitch (inch) | EIA <br> 3imilar <br> package <br> designation |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

See footnotes at end of table.

TABLE VII. Inactive package case outline list - Continued.

1/ See dimension tables herein.
2/ The "base-line" values shown are worst case (MEAN $+2 \sigma$ ) for a $60 \times 60$ mil microcircuit device silicon die and applicable for devices with die sizes up to 14400 square mils. For device die sizes greater than 14400 square mils use the following values; dual-in-line, $11^{\circ} \mathrm{C} / \mathrm{W}$; chip carrier, $10^{\circ} \mathrm{C} / \mathrm{W}$; flat pack, $10^{\circ} \mathrm{C} / \mathrm{W}$; pin grid array, $10^{\circ} \mathrm{C} / \mathrm{W}$.
3/ Caution. The Electronic Industries Alliance (EIA) similar package may change. The original or changed package may not satisfy device specification requirements or the requirements of this standard. Therefore, do not use the EIA similar package designation for item acquisition; it is for information only.
4/ Packages shall be selected from tables VI and VII by reference to the "descriptive package type designator" which, in turn, shall be referenced in device specifications in accordance with the example depicted in figure 2. The example shows how to integrate a descriptive designator, a case outline letter, and a PIN. There are circumstances when a package with multiple outline configurations, each identified with the same dimension reference number, will have all outline configurations considered interchangeable and acceptable without preference, see column 2 of tables VI and VII and 3.1.2. A package such as above shall be specified in device specifications by assigning the same case outline letter to each outline configuration, see case outline letter " H " in the figure 2 example. Conversely, when it is desired not to accept certain outline configuration combinations
 configurations. These letters and numbers are also used for all the packages in this standard that do not have a dedicated case outline letter, see 4.7.1.
5/ The suffix letter " N " shall be substituted with a specified terminal count. When two or more grid array packages are used in the same device specification, and are identical except for pin location, each package shall be separately identified, see table V.
6/ Inactive for new design. Acceptable only for use in equipment designed or redesigned on or before 29 November 1986.
7/ Inactive for new design. Acceptable only for use in equipment designed or redesigned on or before 15 May 1992.

## 5. DETAILED REQUIREMENTS

5.1 Package styles and package types. Package styles and package types are listed in tables VI and VII with brief descriptions.
5.2 Unique package features. Unique package features are depicted as follows.
5.2.1 Flat pack end leads. Flat packs which have leads extending from the ends of the body may have different lead configurations as shown on figure 3. Dimension $\alpha$ applies only to that portion of the lead within dimension E which bends into the body.

FIGURE 3. Lead bend angle.
5.2.2 Glass sealed flat pack minimum S1 dimension. The minimum limit of dimension S1 shall be either . 000 $(0.00 \mathrm{~mm})$ or $.005(0.13 \mathrm{~mm})$ depending on what lead configuration is used (see figure 4). In example A, the minimum limit is $.005(0.13 \mathrm{~mm})$. In example B, if the lead bends toward the cavity within one lead width as shown, the minimum limit is $.000(0.00 \mathrm{~mm})$; otherwise the criteria for example A shall apply. For metal-sealed bottombrazed leads, dimension S1 shall be measured from the edge of the furthest extension of the metal pad or lead, whichever is closest to the corresponding edge of the package body.

FIGURE 4. Lead space from package end.

## MIL-STD-1835D

5.2.3 DIP lead row center dimension eA. Dimension eA on DIP outlines shall be measured at the center of the lead bends (see figure 5) or at the centerline of the lead when $\alpha$ is $90^{\circ}$. For side-brazed leads, this dimension shall be measured at the centerlines of the leads.

FIGURE 5. Lead row center dimension.
5.2.4 DIP dimensions $L$ and $Q$. Dimensions $L$ and $Q$ on DIP style packages shall be measured from the lead tips and base plane to the seating plane (see figure 6). The seating plane is located at the lowest point on the lead at which the lead width exceeds .040 inch $(1.02 \mathrm{~mm})$ minimum excluding any half leads at the package ends. (The illustration shows a tapered lead at the seating plane, other lead shapes in this area are also acceptable, see details $B, C$, and D on the DIP drawings.)

FIGURE 6. DIP standoff dimension Q.

## MIL-STD-1835D

5.2.5 DIP end variations dimension S1. For all DIP configurations, dimension S1 shall be measured from the edge of the furthest extension of the metal pad or lead whichever is closest to the end of the body (see figure 7).

FIGURE 7. DIP package end variations.
5.2.6 Leadless chip carrier (LCC) castellation irregularities. Analysis of the chip carrier castellation by measurement requires that all surface irregularities of the castellation (the shaded area) be within dimensions L3 and B3 as delineated on figure 8. It is also required that the castellation be located within the LCC terminal pad width, exclusive of the annular ring, as shown on figure 8.

FIGURE 8. Measurement and alignment of LCC castellation.

## MIL-STD-1835D

5.2.7 Coplanarity deviation. The coplanarity deviation of all terminal contact points, as defined by the device seating plane, shall be determined for surface mounted devices. Measurements shall be made from the device seating plane (see figure 9). Regardless of package size, any device with one or more terminals that exceed the specified coplanarity deviations shall constitute a failure.

## ANY FORMED LEAD OR LEADLESS SURFACE MOUNTED DEVICE

FIGURE 9. Coplanarity deviation.
5.2.8 Package cavity orientation. Unless otherwise specified herein, for most packages, cavity orientation (see figure 10) is standard in the "cavity-up" position. When a particular package style includes optional cavity orientation, such as cavity-down, the cavity-down option shall be specified by adding a suffix $D$ to the terminal- count part of the descriptive type designator (see figure 1).

FIGURE 10. Package cavity orientation.
5.2.9 Package drawings. Detailed package drawings and dimensional criteria shall be as specified in the individual style requirements.
5.3 Dimensional listings in the individual requirements. Dashes are used to indicate "not specified" and blanks are used to indicate "not applicable".

## MIL-STD-1835D

## 6. NOTES

(This section contains information of a general or explanatory nature which may be helpful, but is not mandatory.)
6.1 Intended use. Packages conforming to the requirements of this standard are intended for use in electronic equipment.
6.2 Tailoring guidance for contractual application. For purposes of this standard, tailoring refers to the selection of optional package features when they are specified in the individual style requirements. For example, one may select top and bottom terminals and thermal conduction pads on certain chip carrier packages.

6.4 Package cross-reference list. The following table provides a cross-reference of package type numbers (and configuration numbers where applicable) that were listed in appendix C of MIL-M-38510, to the package descriptive type designators listed in this standard. Packages were deleted from appendix C of MIL-M-38510 with the publication of this standard. The appendix C numbers are in alphanumeric sequence; underlined descriptive type designators are inactive (see table VIII).

## MIL-STD-1835D

6.5 Plastic encapsulated microcircuit packages. The plastic encapsulated microcircuit packages listed in table IX are recommended for use in those DoD systems that are using plastic packages. The dimensions and tolerances for the plastic packages listed in table IX are available for use in the JEP-95 outline shown and should be directly invoked from that document.

TABLE IX. Plastic encapsulated microcircuit packages.

## MIL-STD-1835D

## NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark. Alternatively, a tab (dimension k) may be used to identify pin one. This tab may be located on either side of terminal one as shown in detail A, or it may be located on terminal one as shown in detail B.
2. If a pin one identification mark is used in addition to a tab, the limits of dimension k do not apply.
3. This dimension allows for off-center lid, meniscus, and glass overrun.
4. Dimensions b1 and c1 apply to lead base metal only. Dimension M applies to lead plating and finish thickness. The maximum limits of lead dimensions $b$ and $c$ or $M$ shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
5. N is the maximum number of terminal positions.
6. Measure dimension S1 at all four corners, see 5.2.5. There is an alternative minimum limit to dimension S1, see 5.2.2.
7. For bottom-brazed lead packages, no organic or polymeric materials shall be molded to the bottom of the package to cover the leads.
8. Optional, see note 1. If a pin one identification mark is used in addition to this tab, the minimum limit of dimension $k$ does not apply.
9. Applies to leads exiting the end of the body (short side) and closest to the corners.
10. Lead configuration is optional within dimension E except dimensions b and c apply (see 5.2.1).
11. Dimension $Q$ shall be measured at the point of exit (beyond the meniscus) of the lead from the body. Dimension Q minimum shall be reduced by .0015 inch ( 0.038 mm ) maximum when solder dip lead finish is applied.
12. See tables VI and VII for descriptive type designators.
13. Configurations $C$ and $D$ are inactive for applications in new equipment design, see 4.8.
14. Ax is used instead of $A$ for configuration $D$ only.
15. Dimension " A " controls the overall package thickness. When a window lid is used, dimension "A" must increase by a minimum of .010 inch ( 0.254 mm ) and a maximum of .040 inch ( 1.020 mm ).

## MIL-STD-1835D

REQUIREMENT 102

## DUAL-IN-LINE PACKAGE STYLE

Configuration A
Ceramic, glass-sealed

Configuration B
Ceramic, metal-sealed, bottom-brazed leads

Configuration C
Ceramic, metal-sealed, side-brazed leads

## MIL-STD-1835D

## NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark.
2. The maximum limits of lead dimensions $b$ and $c$ or $M$ shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
3. Dimensions b1 and c1 apply to lead base metal only. Dimension $M$ applies to lead plating and finish thickness.
4. The b2 minimum dimension of .045 inch ( 1.14 mm ) was implemented 30 September 1992. Until that date, a minimum dimension of $.038(0.97 \mathrm{~mm})$ was acceptable. See 5.2.4
5. Corner leads ( $1, \mathrm{~N}, \mathrm{~N} / 2$, and $\mathrm{N} / 2+1$ ) may be configured as shown in detail A . For this configuration dimension b3 replaces dimension b2.
6. This dimension allows for off-center lid, meniscus, and glass overrun.
7. For configuration B, no organic or polymeric materials shall be molded to the bottom of the package to cover the leads.
8. Pointed or rounded lead tips as shown in details $B$ and $C$ are preferred to ease insertion, but are not mandatory.
9. Dimension $Q$ shall be measured from the seating plane to the base plane.
10. Measure dimension S1 at all four corners, see 5.2.5.
11. Measure dimension S 2 from the top of the ceramic body to the nearest metallization or lead
12. N is the maximum number of terminal positions.
13. Braze fillet shall be concave. The maximum dimensions of this fillet include solder dip or tin plate lead finish, if applied.
14. See tables VI and VII for descriptive type designators.

## MIL-STD-1835D

## NOTES:

1. (All leads) $\varnothing \mathrm{b}$ applies between L1 and L2. $\varnothing \mathrm{b} 1$ applies between L 2 and .500 inches from the reference plane. Diameter is uncontrolled in L1 and beyond .500 inches from the reference plane.
2. The package feature described by dimension symbols $\varnothing \mathrm{D} 2$ and Q does not exist for variation A 4 ; therefore the reference, base, and seating planes are the same for this variation.
3. Measured from maximum diameter of the product.
4. $\alpha$ is the basic spacing from the centerline of the tab to terminal 1 and is the basic spacing of each lead or lead position ( $\mathrm{N}-1$ places) from $\alpha$, looking at the bottom of the package.
5. N is the maximum number of terminal positions.
6. Leads having a maximum diameter .019 inches measured in gauging plane $.054+.001-.000$ inches below the base plane of the product shall be within .007 inches of their true position relative to a maximum width tab.
7. This style package may be measured by direct methods or by gauge.
8. See table VI for descriptive type designators.

| Note | 1,2 |  |  |  |  |  |  |  |

## NOTES:

1. Dimensioning and tolerancing in accordance with ASME Y14.5M-1994.
2. Controlling dimension, inch.
3. Maximum increase when lead finish $A$ or $B$ is applied.
4. The increase in the $b$ dimension, as a result of lead finishes, does not change the positional tolerance, .010, which is applied at MMC of .018 .

## MIL-STD-1835D

## NOTES:

1. See table VI for descriptive type designator.
2. To specify options $A$ or $B$ in acquisition documents, see figure 1.
3. Metallized castellations shall be connected to plane 1 terminals and extend toward plane 2 across at least two layers of ceramic or completely across all of the ceramic layers to make electrical connection with the optional plane 2 terminals.
4. Unless otherwise specified, a minimum clearance of $.015 \mathrm{inch}(0.381 \mathrm{~mm})$ shall be maintained between all metallized features (e.g., lid, castellations, terminals, thermal pads, etc.).
5. Symbol " N " is the maximum number of terminals. Symbols "ND" and "NE" are the number of terminals along the sides of length "D" and "E" respectively.
6. The required plane 1 terminals and optional plane 2 terminals shall be electrically connected.
7. The index feature for terminal 1 identification, optical orientation or handling purposes, shall be within the shaded index areas shown on planes 1 and 2. Plane 1 terminal 1 identification may be an extension of the length of the metallized terminal which shall not be wider than the $B_{1}$ dimension. See note 8 for more details.
8. Plane 1 is the heat radiating surface. This surface may optionally be metallized with a checkerboard pattern of thermal conduction pads. The pad centerlines shall be aligned with the terminal centerlines. The number of pads in the pattern is determined by the following algorithm: (ND - 2) x (NE -2) see note 5 . When this option exists, the thermal pad which is adjacent to terminal 1 shall be deleted.
9. Dimension "A" controls the overall package thickness. When a window lid is used, dimension "A" must increase by a minimum of .010 inch $(0.254 \mathrm{~mm})$ and a maximum of .040 inch ( 1.020 mm ). The maximum "A" dimension is the package height before being solder dipped.
10. The corner shape (square, notch, radius, etc.) may vary at the manufacturer's option, from that shown on the drawing. The index corner shall be clearly unique.
11. See 5.2 .6 and figure 8. Dimensions "B3" minimum and "L3" minimum and the appropriately derived castellation length define an unobstructed three dimensional space traversing all of the ceramic layers in which a castellation was designed. (Castellations are required on bottom two layers, optional on top ceramic layer.) Dimensions "B3" maximum and "L3" maximum define the maximum width and depth of the castellation at any point on its surface. Measurement of these dimensions may be made prior to solder dipping.
12. Corner metallization for terminals may have a .020 inch $(0.51 \mathrm{~mm})$ by 45 E maximum chamfer to obtain the $\mathrm{e}_{1}$ dimension.
13. Chip carriers shall be constructed of a minimum of two ceramic layers.
14. The pad metallization, including annular ring, at the pad-to-package edge shall be within the virtual pad width established by true position dimensioning.
15. The tolerance is intended to limit package edge anomalies caused by material protrusions, such as rough ceramic, and misaligned ceramic layers.
16. When the number of terminals per side is even, datums $F, G$, and $H$ are located at the terminal array centers. When the number of terminals per side is odd, datums $F$, $G$, and $H$ are located at the centers of the center terminals.
17. The 4 (C-14) and 6 (C-15) terminal variations have terminals on the ("D") ends of the package only. Terminal 1 for $\mathrm{C}-14$ is the closest terminal to the index corner.

## MIL-STD-1835D

NOTES:

1. Symbol " N " is the maximum number of terminals. Symbols "ND" and "NE" are the number of terminals along the sides of lengths "D" and "E" respectively.
2. A terminal 1 identification mark shall be located on the first side clockwise from the index corner, within the shaded area shown. Terminal numbers shall increase in a counterclockwise direction when viewed as shown. If the identification mark is not exactly adjacent to terminal 1 , terminal 1 is located as follows:
a. If the number of terminals on a side is odd, terminal 1 is the center terminal.
b. If the number of terminals on a side is even, terminal 1 is the terminal which is adjacent to the centerline of the terminal array in the direction closest to the index corner.
3. When the number of terminals per side is even, datums $A, B$, and $D$ are located at the terminal array centers. When the number of terminals per side is odd, datums $A, B$, and $D$ are located at the centers of the center terminals. The measurement point for establishing these datums is the package/lead interface at datum plane H .
4. Dimension "A" controls the overall package height. When a window lid is used, dimension "A" must increase by a minimum of .010 inch ( 0.254 mm ) and a maximum of .040 inch $(1.020 \mathrm{~mm})$.
5. Corner shape (square, notch, radius, etc.) may vary from that shown on the drawing. The index corner shall be clearly unique.
6. Chip carriers shall be constructed of a minimum of two ceramic layers.
7. This dimension allows for package edge anomalies caused by material protrusion, such as rough ceramic, misaligned ceramic layers and lids, meniscus, and glass overrun.
8. The leads on this package style shall be protected from mechanical distortion and damage such that dimensions pertaining to relative lead/body "true positions" and lead "coplanarity" are always maintained until the next higher level package attachment process is complete. Package lead protection mechanisms (tie bars, carriers, etc.) are not shown on the drawing; however, when electronic devices contained in this package style are shipped for use in Government equipment, or shipped directly to the Government as spare parts or mechanical qualification samples, lead protection shall be in place.
9. The quad leaded chip carrier drawings in this outline requirement show a "gullwing" lead configuration. An optional lead configuration can be specified for unformed (straight) leads, see figure 1 and table V concerning how to designate an option. When either option is selected and straight leads are subsequently formed by the electronic device user, the resultant lead configuration shall conform to the "gullwing" lead dimensions and coplanarity requirements specified herein.
10. See table VI for descriptive type designator.

## MIL-STD-1835D

## NOTES:

1. A terminal 1 identification mark shall be located at the index corner in the shaded area shown. Terminal 1 is located immediately adjacent to and counterclockwise from the index corner. Terminal numbers increase in a counterclockwise direction when viewed as shown.
2. Generic lead attach dogleg depiction. May be flat lead configuration.
3. Corner shapes (square, notch, radius, etc.) may vary from that shown on the drawing. The index corner shall be clearly unique.
4. Dimension N: Number of terminals.
5. Dimension ND/NE: Number of terminals per package edge.
6. No overhang of the lead on the braze pad is allowed.
7. Dimension b and c include lead finish; dimensions b1 and c1 apply to base metal only. Dimension M applies to plating thickness.
8. The leads of this package style shall be protected from mechanical distortion and damage such that dimensions pertaining to relative lead/body "true positions" and lead "coplanarity" are always maintained until the next higher level package attachment process is complete. Package lead protection mechanisms (tie bars, carriers, etc.) are not shown on the drawing, however when electronic devices contained in this package style are shipped for use in Government equipment, or shipped directly to the Government as spare parts or mechanical qualification samples, lead "true position" and "coplanarity" protection shall be in place.
9. The lead tip location may be determined with the use of the lead position gauge shown. Each lead tip and the body shall simultaneously reside within defined areas of the gauge.
10. The quad leaded chip carrier drawings in this outline requirement show a "gullwing" lead configuration. An optional configuration can be specified; it is for unformed (straight) leads, see figure 1 and table V concerning how to designate this option. When either option is selected and straight leads are subsequently formed by the electronic device user, the resultant lead configuration shall conform to the "gullwing" lead dimensions and coplanarity requirements specified herein.
11. See table VI for descriptive type designator.

## MIL-STD-1835D

NOTES:

1. A terminal 1 identification mark shall be located on the first side clockwise from the index corner, within the shaded area shown. Terminal numbers shall increase in a counterclockwise direction when viewed as shown. If the identification mark is not exactly adjacent to terminal 1 , terminal 1 is located as follows:
a. If the number of terminals on a side is odd, terminal 1 is the center terminal.
b. If the number of terminals on a side is even, terminal 1 is the terminal which is adjacent to the centerline of the terminal array in the direction closest to the index corner.
2. This dimension delineates the minimum clearance between the inside of the lead and the top of the body. One-half of the minimum clearance from the body establishes a limit beyond which package edge anomalies caused by material protrusion such as rough ceramic, misaligned ceramic layers, glass meniscus, or overrun shall not extend.
3. Symbol N: Number of terminals.
4. Symbols ND/NE: Number of terminals per package edge.
5. Corner shape (square, notch, radius, etc.) may vary from that shown on the drawing. The index corner shall be clearly unique.
6. Dimensions b1 and c1 apply to base metal only. Dimension $M$ applies to plating thickness.
7. The leads on this package style shall be protected from mechanical distortion and damage such that dimensions pertaining to relative lead/body "true positions" and lead "coplanarity" are always maintained until the next higher level package attachment process is complete. Package lead protection mechanisms (tie bars, carriers, etc.) are not shown on the drawing; however, when electronic devices contained in this package style are shipped for use in Government equipment, or shipped directly to the Government as spare parts or mechanical qualification samples, lead protection shall be in place.
8. The location of each lead seating plane "interface area" may be determined with the use of the lead position gauge shown. The interface area of each lead and the body shall simultaneously reside within defined areas of the gauge.
9. UV window is optional. See table VI for descriptive type designator
10. Body contour along dotted lines optional.
11. The minimum arc length "AL" of radius $R$ shall be "AL $=135 \pi R / 180$ ".
12. The quad leaded chip carrier drawings in this outline requirement show a "J" lead configuration. An optional configuration can be specified; it is for unformed (straight) leads, see figure 1 and table V concerning how to designate this option. When either option is selected and straight leads are subsequently formed by the electronic device user, the resultant lead configuration shall conform to the "J" lead dimensions and coplanarity requirements specified herein.

## MIL-STD-1835D

## NOTES:

1. A terminal 1 identification mark shall be located on the first side clockwise from the index corner, within the shaded area shown. Terminal numbers shall increase in a counterclockwise direction when viewed as shown. If the identification mark is not exactly adjacent to terminal 1 , terminal 1 is located as follows:
a. If the number of terminals on a side is odd, terminal 1 is the center terminal.
b. If the number of terminals on a side is even, terminal 1 is the terminal which is adjacent to the centerline of the terminal array in the direction closest to the index corner.
2. Symbol N: Number of terminals.
3. Symbols ND/NE: Number of terminals per package edge. ND/NE $=\mathrm{N} / 4$
4. Corner shapes (square, notch, radius, etc.) may vary from that shown on the drawing. The index corner shall be clearly unique.
5. Dimensions b1 and c1 apply to base metal only. Dimension M applies to plating thickness.
6. The leads on this package style shall be protected from mechanical distortion and damage such that dimensions pertaining to relative lead/body "true positions" and lead "coplanarity" are always maintained until the next higher level package attachment process is complete. Package lead protection mechanisms (tie bars, carriers, etc.) are not shown on the drawing, however when electronic devices contained in this package style are shipped for use in Government equipment, or shipped directly to the Government as spare parts or mechanical qualification samples, lead protection shall be in place.
7. The location of each lead seating plane "interface area" may be determined with the use of the lead position gauge shown. The interface area of each lead and the body shall simultaneously reside within defined areas of the gauge.
8. The maximum " A " dimension allows for an EPROM window lid.
9. The quad leaded chip carrier drawings in this outline requirement show a "J" lead configuration. An optional configuration can be specified; it is for unformed (straight) leads, see figure 1 and table V concerning how to designate this option. When either option is selected and straight leads are subsequently formed by the electronic device user, the resultant lead configuration shall conform to the "J" lead dimensions and coplanarity requirements specified herein.
10. See table VI for descriptive type designator.
11. $\mathrm{D} 2 / \mathrm{E} 2=\mathrm{D} 1 / \mathrm{E} 1 \mathrm{max}+.004$ inch $(0.10 \mathrm{~mm})$.

## MIL-STD-1835D

## NOTES:

1. A terminal 1 identification mark shall be located at the index corner in the shaded area shown. Terminal 1 is located immediately adjacent to and counterclockwise from the index corner. Terminal numbers increase in a counterclockwise direction when viewed as shown.
2. Generic lead attach dogleg depiction. May be flat lead configuration.
3. Includes lead attach dogleg height and lid height, whichever is greater.
4. Corner shapes (square, notch, radius, etc.) may vary from that shown on the drawing. The index corner shall be clearly unique.
5. Dimension N: Number of terminals.
6. Dimension ND/NE: Number of terminals per package edge.
7. Regardless of the virtual length, the . 002 limit ensures an accurate square trim for subsequent lead forming tool registration.
8. Lead coplanarity shall be .004 inch $(0.10 \mathrm{~mm})$ within .050 inch $(1.27 \mathrm{~mm})$ from package body.
9. No overhang of the lead on the braze pad is allowed.
10. Dimensions b1 and c1 apply to base metal only. Dimension $M$ applies to plating thickness.
11. The leads on this package style shall be protected from mechanical distortion and damage such that dimensions pertaining to relative lead/body "true positions" and lead "coplanarity" are always maintained until the next higher level package attachment process is complete. Package lead protection mechanisms (tie bars, carriers, etc.) are not shown on the drawing, however when electronic devices contained in this package style are shipped for use in Government equipment, or shipped directly to the Government as spare parts or mechanical qualification samples, lead "true position" and "coplanarity" protection shall be in place.
12. The lead tip location may be determined with the use of the lead position gauge shown. Each lead tip and the body shall simultaneously reside within defined areas of the gauge.
13. Lead tip coplanarity shall be .030 inch $(0.76 \mathrm{~mm})$ at minimum lead length.
14. See table VI for descriptive type designator.
15. The lead tip-to-tip profile is specified by this feature control frame.

## MIL-STD-1835D

## NOTES:

1. See table VI for descriptive type designator.
2. Refer to 3.1 .25 herein which lists and defines dimensioning symbols.
3. "M" represents the maximum pin matrix size.
4. " N " represents the maximum allowable number of pins. Specify in the electronic device acquisition document the actual number of pins needed within the maximum allowed, and the location of the pins within the matrix.
5. Dimension "A1" includes the package body and lid for both cavity-up and cavity-down configurations. The listed packages shall be identified as cavity up and optionally as cavity down in electronic device acquisition documents (see 5.2.8). Dimension "A1" does not include heatsinks or other attached features.
6. Standoffs are required and shall be located on the pin matrix diagonals. The seating plane is defined by the standoffs at dimensions Q or Q1.
7. Dimension "Q" applies to cavity-up configurations only. Dimension "Q1" applies to cavity-down configurations only (see reference drawing on figure 10).
8. All pins shall be on the .100 inch $(2.54 \mathrm{~mm})$ grid.
9. Datum " C " is the plane of pin to package interface for both cavity up and down configurations (see reference drawing on figure 10.)
10. Pin diameter includes solder dip or custom finishes. Pin tips shall have a radius or chamfer.
11. A pin "A1" identification shall be located at the index corner on both top and bottom surfaces of the package. The identification may be mechanical or graphical. It shall not include the manufacturer's identification. It may be different or the same on each surface.
12. Unless otherwise specified, a minimum clearance of $.020 \mathrm{inch}(0.51 \mathrm{~mm})$ shall be maintained between all metallized features on the package surface.
13. Corner shape (chamfer, notch, radius, etc.) may vary from that shown on the drawing.
14. Dimension "S" is measured with respect to datums A and B.
15. For small outline packages, dimension aaa is measured with respect to datum $A$ and $B$ regardless of feature size.

## MIL-STD-1835D

## NOTES - Continued.

16. The PGA alpha numeric grid system for designating terminal positions shall be as follows:
a. A row-column grid system shall be used to designate the terminal positions.
b. With the package viewed looking toward the seating plane and the reference or index corner in the lower left, the rows of the array shall be designated by the letters of the alphabet excluding I, O, Q, S, $X$, and $Z$ from bottom to top. For packages having more than 20 rows, the 21 st row shall be designated $A A$, the $22 n d, A B$, etc. The columns of the array shall be numbered from left to right.
c. Since this system designates terminal positions, rows or columns without terminals shall be designated the same as if terminals were present.

CORNER

Example of $24 \times 24$ terminal position array
with no terminals present in rows B and AC.
Viewed looking toward seating plane.

NOTES:

1. Dimensions are in inches.
2. For configuration C a terminal 1 identification mark shall be located in the shaded index area shown. Terminal 1 shall be located immediately adjacent to and clockwise from the index area. Terminal numbers shall increase in a clockwise direction when viewed as shown.
3. These dimensions should be measured at points .050 inch ( 1.27 mm ) +.005 inch $(0.13 \mathrm{~mm})-.000$ inch $(0.00 \mathrm{~mm})$ below seating plane. When gauge is not used, measurement will be made at the seating plane.
4. Two places.
5. The seating plane of the header shall be flat within .001 inch $(0.03 \mathrm{~mm})$ concave to .004 inch $(0.10 \mathrm{~mm})$ convex inside a .930 inch ( 23.62 mm ) diameter circle on the center of the header and flat within .001 inch $(0.03 \mathrm{~mm})$ concave to .006 inch $(0.15 \mathrm{~mm})$ convex overall.
6. Lead diameter and glass meniscus shall not exceed twice $\varnothing \mathrm{b}$ within L1.

## MIL-STD-1835D

## NOTES:

1. Controlling dimension: Inch.
2. Metallized castellations shall be connected to plane 1 terminals.
3. Index area: An identification mark shall be located adjacent to pin one within the shaded area shown. Plane 1 terminal identification may be an extension of the length of the metallized terminal which shall not be wider than the $b$ dimension.
4. The cover shall not extend beyond the edges of the body.
5. The corner shape (square, notch, radius, etc.) may vary at the manufacturer's option.
6. N indicates total number of terminal positions.
7. Unless otherwise specified, a minimum clearance of .015 inch shall be maintained between all metallized features (e.g., lid, castellation, terminals, thermal pads, etc.).
8. Solder finish is optional with a maximum allowable thickness of .007 inch. Measurement of dimensions A, b1, and L2 may be made prior to solder application.
9. For terminal identification purposes only, terminals between N1 and N2 and between N3 and N4 are omitted if values for N1, N2, N3 and N4 are listed on the table.

NOTE:
The user's attention is called to the possibility that compliance with this outline requirement may require use of an invention covered by patent rights; specifically, National Semiconductor, Inc. has stated that U. S. Patent No. $4,796,080$ may relate to a certain implementation of this product outline. By publication of this outline requirement, no position is taken with respect to the validity of this claim of any patent rights in connection therewith.

## MIL-STD-1835D

NOTES:

1. A terminal 1 identification mark shall be located at the index corner in the shaded area shown. Terminal 1 is located immediately adjacent to and counterclockwise from the index corner. Terminal numbers increase in a counterclockwise direction when viewed as shown.
2. Generic lead attach dogleg depiction. May be flat lead configuration.
3. Includes lead attach dogleg height and lid height, whichever is greater. Dimension A and A1 do not include heat sinks or other attached features.
4. Corner chamfers and or notches are optional. Pin 1 may have optional feature (larger or smaller chamfer or notch) for mechanical orientation purposes.
5. Dimension N: Number of terminals.
6. Dimension ND/NE: Number of terminals per package edge.
7. Controlling dimension: Inch.
8. Dimensions b1 and c1 apply to base metal only, dimension $M$ applies to the plating thickness.
9. Optional hole configuration applicable to all four corners.
10. Circular corner hole only. Slotted hole locations are shown on detail D (optional).
11. Lead repair is optional. This view shows the drawn portion of the lead that must reside within these dimensions. The shape of the repaired lead (as shown) is for reference only.
12. Coplanarity requirements do not apply in this area of a repaired lead.

NOTES:

1. See table VI for descriptive type designator.
2. A lead one identification mark shall be located adjacent to lead one within the shaded area shown.
3. Corner shape (square, chamfer, radius, etc.) may vary at the manufacturer's option.
4. $N$ indicates the maximum number of leads.
5. Dimension b1 and c1 apply to base metal only.
6. Twenty lead device shown for illustration purposes only.
7. Dimension E1 does not include lid thickness.
8. Nominal dimensions are the dimensions recommended for design and manufacture.

## MIL-STD-1835D

## NOTES:

1. See table VI for descriptive type designator.
2. Refer to 3.1.25 herein which lists and defines dimensioning symbols.
3. Terminal position designation shall be in accordance with style requirement 111, note 16 herein.
4. "M" represents the pin matrix size.
5. " $N$ " represents the maximum allowable number of pins.
6. Twenty-three by twenty-three matrix sizes are shown for illustration only.
7. Dimension "A" includes the package body and lid for both cavity up and down configurations (see reference drawing).
8. Dimension " $A$ " does not include integral heatsink or attached features.
9. Standoffs should be located on the pin matrix diagonals.
10. The seating plane is the outer standoff surface facing away from the ceramic body.
11. Dimension "Q" applies to cavity up configuration only. Dimension "Q1" applies to cavity down configuration only (see reference drawing).
12. " $S$ " is measured with respect to datum $A$ and datum $B$ and defines the position of the center pin in the outer row, when there is an odd number of pins in the outer row, " S " $=.000$ inch, when an even number are used, " S " $=.050$ inch ( 1.27 mm ). All pins in a given row must be on a .100 inch $(2.54 \mathrm{~mm})$ grid. Adjacent rows offset by .050 inch ( 1.27 mm ).
13. Datum C is the plane of pin to package interface for both cavity up and down configurations (see reference drawing).
14. Pin diameter includes solder dip or custom finishes.
15. Pin tips shall have a radius or chamfer.
16. There must be some type of A1 corner identification on both top and bottom surfaces of the package. ID type is optional and may consist of notches, ID pins, metallized markings or other features. The features used on each surface may be of differing types.
17. There must be .010 inch ( 0.254 mm ) minimum spacing between any two metallized features on the package.
18. Dimension "D" and "E" do not include ceramic protrusions. Such protrusions may not exceed more than . 003 inch ( 0.076 mm ) on any side. Corners of the package body may have chamfers for mechanical protection or identification.
19. This dimension defines the maximum size for the braze pads, pins must be positioned entirely on the braze pads.

## MIL-STD-1835D

## NOTES:

1. Index area; A notch or a pin one identification mark shall be located adjacent to pin on and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark. Alternately, a tab (dimension k) may be used to identify pin one. This tab may be located on either side of terminal one as shown in detail A.
2. If a pin one identification mark is used in addition to a tab, the limits of dimension $k$ do not apply.
3. This dimension allows for off-center lid, meniscus, and glass overrun.
4. Dimensions b1 and c1 apply to lead base metal only. Dimension M applies to lead plating and finish thickness. The maximum limits of lead dimensions band cor M shall be measured at the centroid of the finished lead surface, when solder dip or tin plate lead finish is applied.
5. N is the maximum number of terminal positions.
6. See tables VI and VII for descriptive type designators.
7. Measure dimension S1 at all four corners, see 5.2.5. There is an alternative minimum limit to dimension S1, see 5.2.2.

NOTES:

1. Dimension $\varnothing$ b1 applies to base metal only. Dimension $\varnothing \mathrm{b}$ applies to plated part.
2. Section A-A dimensions apply between .100 inch $(2.54 \mathrm{~mm})$ to .150 inches ( 3.81 mm ) from lead tip.
3. Pointed or rounded lead tips are preferred to ease insertion.
4. Methods used for electrical isolation of the terminal feed through shall employ materials that contain a minimum of 90 percent $\mathrm{AL}_{2} \mathrm{O}_{3}$ (ceramic).
5. See table VI for descriptive type designators.

[^0]:    1/ This definition of package type is taken from MIL-PRF-38535, appendix A. Note, however, that this standard does not specify package interior attributes.

[^1]:    2/ From ASME Y14.5M, see 2.2.
