**3 September 2009**

**DEPARTMENT OF DEFENSE  
STANDARD PRACTICE  
ELECTRIC PLANT INSTALLATION  
STANDARD METHODS FOR  
SURFACE SHIPS AND SUBMARINES  
(CABLEWAYS)**

MIL-STD-2003-4B(SH)

FOREWORD

1. This standard is approved for use by the Naval Sea Systems Command, Department of the Navy, and is available for use by all Departments and Agencies of the Department of Defense.
2. This standard disseminates up-to-date information detailing requirements for standard installation methods employed for cableways for submarine and surface ship electrical distribution systems.
3. These criteria are for application to new construction, conversion, and alteration of existing ships.
4. Comments, suggestions, or questions on this document should be addressed to Commander, Naval Sea Systems Command, ATTN: SEA 05S, 1333 Isaac Hull Avenue, SE, Stop 5160, Washington Navy Yard DC 20376-5160 or emailed to [CommandStandards@navy.mil](mailto:CommandStandards@navy.mil), with the subject line "Document Comment". Since contact information can change, you may want to verify the currency of this address information using the ASSIST Online database at <https://assist.dla.mil>.

## CONTENTS

<u>PARAGRAPH</u>	<u>PAGE</u>
1. SCOPE.....	1
1.1 Scope .....	1
1.2 Application .....	1
2. APPLICABLE DOCUMENTS .....	1
2.1 General .....	1
2.2 Government documents. ....	1
2.2.1 Specifications, standards, and handbooks.....	1
2.2.2 Other Government documents, drawings, and publications. ....	2
2.3 Non-Government publications.....	2
2.4 Order of precedence.....	3
3. DEFINITIONS .....	3
3.1 Bottom loading .....	3
3.2 Cableway tier .....	3
3.3 Double banking.....	3
3.4 Multiple banking.....	3
3.5 N.W.T and W.T. ....	3
4. GENERAL REQUIREMENTS .....	3
4.1 Location of cable runs .....	3
4.1.1 Vertical cable runs .....	4
4.1.2 Emergency diesel generator seawater booster pumps.....	4
4.1.3 Interior communications and weapons control .....	4
4.1.4 Control from more than one location .....	4
4.1.5 Weather exposure .....	4
4.1.6 Circuit trunking.....	4
4.1.7 Armored cable .....	4
4.1.8 Dead-ended cable.....	4
4.1.9 Gun mounts.....	4
4.1.10 Rotating missile launchers .....	4
4.1.11 Ballistic structures .....	4
4.1.12 Bulkheads and overheads.....	5
4.1.13 Sonar system cables .....	5
4.2 Spare cable space allowance.....	5
4.3 Or equal .....	5
4.4 Aircraft carrier cables .....	5
4.5 Cables to lighting fixtures and receptacles or other equipment .....	5
4.6 Consideration of electromagnetic shielding.....	5
4.7 Inactive for new design documents .....	5
4.8 Cable bundling, ampacity, and cable derating considerations to avoid cable heating .....	5
4.9 Installation of fiber optic cables in cableways .....	6
4.10 Hazardous materials.....	6
4.11 The terms agreement or approval .....	6
5. DETAILED REQUIREMENTS.....	6
5.1 Cable slack.....	6
5.2 Cable bend radius .....	7
5.3 Protection of cable. ....	7
5.3.1 Battle damage .....	7
5.3.2 Mechanical damage .....	7
5.3.2.1 Auxiliary ship installation.....	7
5.3.2.2 Riser boxes.....	7
5.3.2.3 Weather deck cableways.....	7

## MIL-STD-2003-4B(SH)

5.3.3 Excessive heat.....	7
5.3.4 Excessive moisture .....	7
5.3.5 Cables installed through submerged spaces and voids .....	8
5.3.6 Cable installations in hazardous locations .....	8
5.3.7 Channel rubber.....	8
5.3.7.1 Unarmored cable.....	8
5.3.7.2 Hose clamp retention devices .....	8
5.3.7.3 Armored cable .....	9
5.4 Installation of propulsion system cables .....	9
5.5 Cable handling and stowage .....	9
5.6 Cable tags and conductor wire markers .....	9
5.6.1 Cable tag material and securing cable tags .....	10
5.6.2 Conductor wire marking .....	10
5.7 Cable hangers and supports .....	10
5.7.1 Insulation spacer block .....	10
5.7.2 Shock design.....	10
5.7.2.1 Multiple cable test racks (15 inches free length of cable support) .....	11
5.7.2.2 Single cable supports .....	11
5.7.3 Installation.....	11
5.7.3.1 Hanger loading, spacing, and tier limitations .....	11
5.7.3.1.1 Cable supports for higher voltage cables .....	12
5.7.3.2 Cable racks.....	12
5.7.3.2.1 Support components .....	12
5.7.3.3 Double banking of cable .....	13
5.7.3.4 Cable retention.....	13
5.7.3.5 Plastic sealer .....	13
5.7.3.6 Welding .....	13
5.7.3.7 Fasteners used in cableways .....	13
5.7.3.8 Collar and all weld studs.....	13
5.7.3.9 Bimetallic joints.....	14
6. NOTES .....	14
6.1 Intended use.....	14
6.2 Acquisition requirements.....	14
6.3 Designation of electric plant installation standard methods figures .....	14
6.4 Subject term (key word) listing. ....	14
6.5 Changes from previous issue .....	15
APPENDIX 4A – CABLEWAYS (SUBMARINES).....	16
A.1 SCOPE.....	16
A.1.1 Scope .....	16
A.2. APPLICABLE DOCUMENTS .....	16
A.2.1 General.....	16
A.2.2 Government documents. ....	16
A.2.2.1 Specifications, standards, and handbooks.....	16
A.2.3 Non-Government publications.....	16
A.2.4 Order of precedence.....	17
A.3 REQUIRED EQUIPMENT AND MATERIALS .....	17
A.3.1 Required equipment and materials.....	17
A.4 NOTES AND PROCEDURES .....	17
A.4.1 Dimensions .....	17

## MIL-STD-2003-4B(SH)

## 1. SCOPE

1.1 Scope. This standard covers standard practices for electric plant installation of cableways on surface ships and submarines.

1.2 Application. The installation methods in this document are intended to be used by all installing activities as required by contract, ship specifications, or similar implementing documents. These methods do not normally identify ship or type but do establish standards for cableway installations in naval ships. The methods in this document are for new construction as well as for conversions, alterations, and repairs. It is the responsibility of the user activity to determine which method satisfies their requirements.

## 2. APPLICABLE DOCUMENTS

2.1 General. The documents listed in this section are specified in sections 3, 4, or 5 of this standard. This section does not include documents cited in other sections of this standard or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in sections 3, 4, or 5 of this standard, whether or not they are listed.

2.2 Government documents.

2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

## DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-I-631	- Insulation, Electrical, Synthetic-Resin Composition, Nonrigid
MIL-DTL-901	- Shock Tests, H.I. (High-Impact) Shipboard Machinery, Equipment, and Systems, Requirements for
MIL-DTL-915	- Cable, Electrical, for Shipboard Use, General Specification for
MIL-A-2877	- Aluminum Alloy Tape (see 4.7)
MIL-I-3064	- Insulation, Electrical, Plastic-Sealer
MIL-T-16366	- Terminals, Electrical Lug and Conductor Splices, Crimp-Style
MIL-S-24149	- Studs, Welding, and Arc Shields (Ferrules), General Specification for
MIL-J-24445	- Joint, Bimetallic Bonded, Aluminum to Steel
MIL-DTL-24640	- Cables, Lightweight, Low Smoke, Electric, for Shipboard Use, General Specification for
MIL-DTL-24640/15	- Cable, Electric, -20 to +150 °C, 600 Volts, Lightweight, Multi-Pair, 22 AWG, Type 2XSAW (Including Variation Types 2XSAOW and 2XSAWA)
MIL-DTL-24643	- Cables, Electric, Low Smoke Halogen-Free, for Shipboard Use, General Specification for
MIL-DTL-24643/24	- Cable, Electrical, -20 °C to +150 °C, Types LSTCJX, LSTCKX, LSTCTX, LSTCJXN, LSTCKXN, and LSTCTXN
MIL-DTL-24643/25	- Cable, Electrical, -20 °C to +150 °C, Type LSPI
MIL-DTL-24643/26	- Cable, Electrical, -20 °C to +150 °C, 600 Volts Types LSDPS, LSTPS, LSFPSP, LS7PS, LSDPSN, LSTPSN, LSFPSPN, and LS7PSN
MIL-DTL-32180	- Cable Assembly, Aircraft Electrical Service

## MIL-STD-2003-4B(SH)

## DEPARTMENT OF DEFENSE STANDARDS

MIL-STD-22	- Welded Joint Design
MIL-STD-167-1	- Mechanical Vibrations of Shipboard Equipment (Type I - Environmental and Type II - Internally Excited)
MIL-STD-1689	- Fabrication, Welding, and Inspection of Ships Structure
MIL-STD-2003-1	- Electric Plant Installation Standard Methods for Surface Ships and Submarines (Cable)
MIL-STD-2003-2	- Electric Plant Installation Standard Methods for Surface Ships and Submarines (Equipment)
MIL-STD-2003-3	- Electric Plant Installation Standard Methods for Surface Ships and Submarines (Penetrations)
MIL-STD-2003-5	- Electric Plant Installation Standard Methods for Surface Ships and Submarines (Connectors)
MIL-STD-2042	- Fiber Optic Cable Topology Installation Standard Methods for Surface Ships and Submarines

## DEPARTMENT OF DEFENSE HANDBOOKS

MIL-HDBK-299	- Cable Comparison Handbook Data Pertaining to Electrical Shipboard Cable
--------------	---------------------------------------------------------------------------

(Copies of these documents are available online at <https://quicksearch.dla.mil>.)

2.2.2 Other Government documents, drawings, and publications. The following other Government documents, drawings, and publications form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

## NAVAL SEA SYSTEMS COMMAND (NAVSEA) PUBLICATIONS

S9074-AR-GIB-010/278	- Requirements for Fabrication Welding and Inspection, and Casting Inspection and Repair for Machinery, Piping, and Pressure Vessels
S9407-AB-HBK-010	- Handbook of Shipboard Electromagnetic Shielding Practices
T9070-AL-DPC-020/077-2	- NAVSEA Hazardous Material Avoidance Process
T9074-AD-GIB-010/1688	- Requirements for Fabrication, Welding, and Inspection of Submarine Structure

(Copies of these documents are available online via Technical Data Management Information System (TDMIS) at <https://mercury.tdmis.navy.mil/> by searching for the TMIN without the suffix. Refer questions, inquiries, or problems to: DSN 296-0669, Commercial (805) 228-0669. These documents are available for ordering (hard copy) via the Naval Logistics Library at <https://nll.navsup.navy.mil>. For questions regarding the NLL, contact the NLL Customer Service at [nllhelpdesk@navy.mil](mailto:nllhelpdesk@navy.mil), (866) 817-3130, or (215) 697-2626/DSN 442-2626.)

2.3 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

## MIL-STD-2003-4B(SH)

## ASTM INTERNATIONAL

ASTM F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs

ASTM F594 - Standard Specification for Stainless Steel Nuts

(Copies of these documents are available online at [www.astm.org](http://www.astm.org).)

## IEEE

IEEE 848 - Standard Procedure for the Determination of the Ampacity Derating Factor for Fire-Protected Cable Systems

(Copies of this document are available online at [www.ieee.org](http://www.ieee.org).)

## SAE INTERNATIONAL

SAE-AS33671 - Strap, Tiedown, Electrical Components, Adjustable, Self-Clinching, Plastic, Type I, Class 1

SAE-AS23053/4 - Insulation Sleeving, Electrical, Heat Shrinkable, Polyolefin, Dual-Wall, Outer Wall Crosslinked

SAE-AS23053/5 - Insulation Sleeving, Electrical, Heat Shrinkable, Polyolefin, Flexible, Crosslinked

SAE-AS23053/6 - Insulation Sleeving, Electrical, Heat Shrinkable, Polyolefin, Semi-Rigid, Crosslinked

SAE-AS23053/15 - Insulation Sleeving, Electrical, Heat Shrinkable, Polyolefin, Heavy-Wall, Coated, Flexible, Outer Wall Crosslinked

(Copies of these documents are available online at [www.sae.org](http://www.sae.org).)

2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

## 3. DEFINITIONS

3.1 Bottom loading. Cable secured to the underside of a cableway tier.

3.2 Cableway tier. One row of cable installed in a cableway.

3.3 Double banking. Two rows of cable installed in a single tier of a cableway.

3.4 Multiple banking. Three or more rows of control or instrumentation cables on a single tier or in a cable tray.

3.5 N.W.T and W.T. Acronyms for non-watertight and watertight. These acronyms are used frequently in figures in this document.

## 4. GENERAL REQUIREMENTS

4.1 Location of cable runs. Main fore-and-aft cableways shall be located port and starboard, high and low in ship; lower cableways shall be through machinery spaces and corresponding platform decks, upper cableways under the main deck. This is to provide a quadrangular pattern to allow maximum athwartship and vertical separation of cables to loads requiring two sources of power for systems requiring alternate reliability circuits. For example, a ship service power feeder in the lower starboard cableway should have its complementary emergency or alternate feeder in the upper port cableway.

## MIL-STD-2003-4B(SH)

4.1.1 Vertical cable runs. Vertical cable runs shall be organized on the basis of fore-and-aft or athwartship separation.

4.1.2 Emergency diesel generator seawater booster pumps. Cables supplying emergency diesel generator seawater booster pumps shall be run in the same compartment with, and as close as practicable to, but shall not be attached to the water piping connecting the pump to the diesel engine.

4.1.3 Interior communications and weapons control. The main runs of interior communications and weapons control system cables shall follow cable runs of lighting and power installations. Interior communication and weapons control cables for circuits having several interrelated main and interrelated auxiliary circuits shall be run so that main circuits including normal power supply will be in one group, and auxiliary circuits including alternate power supply will be in another group.

4.1.4 Control from more than one location. Where equipment is controlled from more than one location, the control cabling from each location to the equipment shall be installed in separate wireways.

4.1.5 Weather exposure. Cables shall not be exposed to the weather except where they penetrate a deck or bulkhead to supply equipment. Cables exposed to the weather shall be kept to a minimum. Where possible, cables exposed to the weather shall be protected by installation within conduit, masts, staffs, macks, and yardarms. Use of recessed electrical boxes shall be maximized to reduce exposure of cables to the weather.

4.1.6 Circuit trunking. Location and arrangement of cable runs shall provide circuit trunking avoiding physical interferences with piping, stanchions, foundations, structural members, and ventilation ducts. Spaces considered harmful to cable or subject to explosion hazards shall be avoided. Cableways shall be arranged so that ventilation will be adequate for maintaining the minimum practicable temperature of cables within the cableway. Cableways shall be located so the cables will not be disturbed by disassembly or removal of machinery.

4.1.7 Armored cable. Armored cable has been identified as detrimental to the ability of low smoke cable to self extinguish. As a result, armored cable is no longer permitted aboard Naval ships except where necessary to provide physical protection to certain cables. These applications are limited aboard ship. Armored cable shall not be installed in weather exposed areas unless run in conduit. The following armored cables are permitted aboard ships:

- a. MIL-DTL-24640/15, 2XSAWA
- b. MIL-DTL-24643/24, LSTCKX, LSTCTX, and LSTCJX
- c. MIL-DTL-24643/25, LSPI
- d. MIL-DTL-24643/26, LSDPS, LSTPS, LSFPS, and LS7PS

4.1.8 Dead-ended cable. Cables installed through error or rendered useless as a result of modification shall be removed. Vacated and unused penetrations shall be sealed by methods that satisfy the tightness requirements of the structure penetrated. See MIL-STD-2003-3 for penetration sealing methods. All unused cable not removed shall be disconnected from all sources of power and verified de-energized. Cables shall be end sealed in accordance with MIL-STD-2003-1. Dead-ended cables shall be permanently labeled at both ends for either future use or removal with cable tags in accordance with 5.6.

4.1.9 Gun mounts. Cables to gun mounts and directors shall be routed from the deck below through the center column. Watertight integrity shall be maintained. Cable shall be located and installed to avoid the possibility of chafing. Nonflexing cables shall terminate in submersible or watertight changeover connection boxes at the point of connection to the flexible cables. Length of flexible cables between changeover connection boxes and the slack cable enclosure shall be kept to a minimum. The slack cable enclosure shall be entered through stuffing tubes. In compartments containing hydraulic systems, the cable installation shall not impair the airtightness or watertightness of decks and bulkheads forming the boundaries of the compartment.

4.1.10 Rotating missile launchers. Cable connections to rotating missile launchers shall comply with the Government Furnished Information (GFI) for the specific ordnance system being connected.

4.1.11 Ballistic structures. Cables shall not be supported or attached to ballistic structures unless approved by NAVSEA. Preferences for cable routing to avoid ballistic structure are as follows:

## MIL-STD-2003-4B(SH)

- a. First preference shall be given to routing cables on the inboard or after bulkheads in the forward half of the ship, and on the inboard or forward bulkheads in the after half of the ship.
- b. Second preference shall be given to routing cables on channels or in cable racks on cable support angles attached to overhead deck beams.

4.1.12 Bulkheads and overheads. Cables shall not be routed on the outboard or forward bulkheads in the forward half of the ship, on the outboard or after bulkheads in the after half of the ship, or when the plating is 50 pounds per square foot (lb/ft<sup>2</sup>) or heavier. This routing shall also be avoided for lighter plating unless no other route is feasible. The installation of cables on the overhead and on bulkheads shall comply with NAVSEA standard methods specified herein. Cables for vital systems, such as interior communication and weapons control systems, shall not be secured to the overhead, to shell planking, to shell plating, or to ballistic bulkheads.

4.1.13 Sonar system cables. Sonar system cables and other low frequency system cables shall be installed in accordance with the requirements of S9407-AB-HBK-010.

4.2 Spare cable space allowance. In the organization of principal cableways, spare cable space of approximately 20 percent of that to be occupied by the final cable installation (as known at time of delivery of the ship) shall be reserved on cableways and in cable penetration areas for future cable installations. The additional cable space may consist of unused hangers or combination of unused hangers and space available on used hangers, assuming that for future addition of cable, double banking will be allowed. During the design phase, the contractor shall provide cableway space in excess of the spare 20 percent in order to accommodate cables added as a result of developments occurring during the construction period.

4.3 Or equal. MIL-STD-2003 uses the terms “or equal” to permit the use of parts, components, or tools that are equivalent and can perform the same function as the specified products. The use of the equivalent product is allowed as long as the same functional characteristics, performance, equipment safety, personnel safety, suitability for marine service, life cycle cost, maintenance cost, and supportability are attained, and agreement is obtained from NAVSEA. The request for agreement for the use of “equal” products shall include data that supports that functional and performance equivalence is retained.

4.4 Aircraft carrier cables. Through horizontal cable runs in aircraft carrier hangar spaces are not permitted. Through vertical runs, such as those from the second deck to the gallery or flight deck levels, shall be grouped to reduce the number of protective casings required and shall be protected from fire.

4.5 Cables to lighting fixtures and receptacles or other equipment. Cables terminating at lighting fixtures, receptacles, or other equipment shall be of unbroken lengths. Separate cables to each lighting fixture or receptacle are not required; a single cable may be run between fixtures or receptacles where more than one fixture or receptacle is installed in a space.

4.6 Consideration of electromagnetic shielding. For cable and cableway installations where electromagnetic shielding is required to be considered, the shielding practices of S9407-AB-HBK-010 shall be used.

4.7 Inactive for new design documents. Some of the documents referenced in MIL-STD-2003-4 have been declared as inactive for new design by decision of the Department of Defense. Where replacement documents are designated, the replacement document is normally substituted for the inactive for new design document. Methods that reference inactive for new design documents shall not be used for new ship design unless approved by NAVSEA. Components and products produced in accordance with the inactive for new design documents shall not be used for new design of systems or equipment; however, this does not prohibit use for maintenance, repair, or resupply purposes.

4.8 Cable bundling, ampacity, and cable derating considerations to avoid cable heating. The requirements and guidance for determining cable ampacity and cable derating for power cables bundled in raceways, trays, cableways, or otherwise bundled together, are as follows:

- a. The ampacities for most power cables covered by MIL-DTL-24643, MIL-DTL-24640, and MIL-DTL-915 are provided in MIL-HDBK-299 for various ambient temperature conditions. These values may be used as the cable ampacity rating when the cable is physically or thermally isolated from other cables.

## MIL-STD-2003-4B(SH)

b. Unless cables rated for temperatures above 105 °C are physically or thermally isolated from other cables of a lower temperature rating, the 105 °C rated cables shall be limited to 90 °C rated service regardless of whether the cables are in raceways, trays, cableways, or otherwise bundled together.

c. To the maximum extent practical, power cables in cableways should be separated from control and instrumentation cables and from other power cables to prevent overheating of the cables.

d. Where cables enter electrical equipment such as switchboards or machinery, care should be exercised to avoid bunching or closely grouping the cables in any manner that may restrict dissipation of heat from the cables.

e. Cables should be derated if installed in locations where the ambient temperature may exceed the temperature rating of the cable. See 5.3.3 for avoidance of exposure of cables to high temperatures.

f. MIL-HDBK-299 provides guidance for derating of cables in some applications. B.4.4 of this document provides requirements for arrangements of direct current propulsion cables on surface ships. For other situations where power cables must be grouped in close proximity, the cable ampacity derating may be determined by a test method or an analytical calculation method. IEEE 848 includes potential methods for determining the ampacity derating by test. If a test method is used, the ampacity for the baseline condition (cables separated) shall be compared to the planned configuration for grouping of the cables. The test or analytical calculation method and the resulting ampacities shall be approved by NAVSEA prior to cable installation.

4.9 Installation of fiber optic cables in cableways. Installation of fiber optic cables and blown fiber cables in cableways shall be in accordance with requirements of MIL-STD-2042 and this standard. For fiber optic cable installation, if there are conflicts between this standard and MIL-STD-2042, the requirements of MIL-STD-2042 take precedence.

4.10 Hazardous materials. Materials and products utilized to execute installation methods in this specification should avoid chemicals listed on the NAVSEA List of Targeted Chemicals (N-LTC) contained within T9070-AL-DPC-020/077-2. These chemicals pose significant risk to the user, environment, or both, and are deemed both undesirable and unsustainable by NAVSEA. NAVSEA is minimizing the use of hazardous materials in procedures such as those covered by this standard. Alternative materials should be considered for applications covered in this document to minimize the use of targeted chemicals. NAVSEA should be informed of the need for the use of any of the targeted chemicals prior to procedure execution.

4.11 The terms agreement or approval. Wherever such terms as “approved” or “agreement” are used without further qualification, it is the approval or agreement of the Supervising Authority or NAVSEA, as applicable, that is intended. In these cases, the approval request and the response shall be formal, in writing, and traceable. Existing methods allowed by applicable ship specifications, such as departures from specifications, are acceptable. The Supervising Authority, also referred to as the Supervisor, is defined in the applicable ship specifications.

## 5. DETAILED REQUIREMENTS

(See figures as well as requirements listed in this section.)

### 5.1 Cable slack. Cable slack requirements are as follows:

a. Cables shall be installed so that sufficient slack exists to allow for deflection of bulkheads under shock conditions.

b. Sag between hangers shall be uniform for each row of cables so that clearance between rows will be the same throughout the cable run.

c. Where cables spread out to enter bulkhead stuffing tubes or multiple cable penetrators, bends shall have liberal sweep to provide as much flexibility as practicable.

d. Cables having only a minimum spread where they pass through bulkhead stuffing tubes or multiple cable penetrators shall have enough slack to give them the same flexibility as other cables in the group.

e. Cables from switchboards or other electric equipment shall enter cableways in a curve of sufficient radius to prevent transmission of stresses to the equipment during severe cableway deflection.

f. Cables crossing expansion joints, such as those under the flight deck and gallery deck of aircraft carriers, shall have slack allowance at such points at least equal to the maximum movement of the expansion joints.

## MIL-STD-2003-4B(SH)

5.2 Cable bend radius. Cable bend radii shall not be less than the values listed in MIL-HDBK-299. The following general requirements are also applicable:

- a. Bends at terminal entrances where stuffing tubes are required shall be made through angle stuffing tubes.
- b. Straight stuffing tubes may be used in place of angle stuffing tubes if the bend in the cable is not less than the minimum bend radius.
- c. Measurement point for minimum radius of bend is that surface of the cable jacket that is on the innermost portion of the cable bend.
- d. The bend radius of individual cable conductors that have been broken out from power and lighting cables (as defined in MIL-HDBK-299) for entry into components shall not be less than the minimum bend radius of the cable. If equipment constraints dictate a smaller bend radius for the conductor, the conductor bend radius shall not be less than eight times the conductor outer diameter, as measured around the individual conductor jacketing. If, during inspections of existing installations, the individual conductor bend radius limit is exceeded, and there is no visible damage and the conductor insulation resistance is measured as satisfactory, no corrective action is required.

### 5.3 Protection of cable.

5.3.1 Battle damage. Protection afforded by the ship structure shall be used to the greatest extent practicable. Cables shall not be run on the exterior of deck houses or similar structures above the main deck (including the island structure of aircraft carriers) except where necessary because of the location of the equipment served.

5.3.2 Mechanical damage. Cables subject to mechanical damage because of their proximity to areas frequented by personnel shall be protected by metal casings. Cableways in areas where their misuse as steps or handholds would cause damage shall be protected. Protective plates shall be installed over the cableways in all passages where cables might be stepped on. At hatch openings and in trunks where objects are raised or lowered, cables shall be protected by metal casings.

5.3.2.1 Auxiliary ship installation. Auxiliary (cargo) ship cable installations shall be routed outside cargo spaces wherever practicable. Where routing through cargo spaces is unavoidable, cables shall be protected from mechanical damage, including damage due to shifting of cargo.

5.3.2.2 Riser boxes. Riser boxes, or multiple cable penetrators with mechanical protection, shall be installed for three or more cables passing through a deck in a group. Where fewer than three cables pass through a deck, kickpipes shall be installed. Kickpipes installed in the vicinity of hydraulic equipment, where the possibility of oil leakage exists, shall be welded in place. Details of kickpipe installations and the installation of top bracing, where required, shall conform to this standard.

5.3.2.3 Weather deck cableways. Cableways installed on weather decks shall be protected by a substantial open bottom steel enclosure. Cableways installed alongside or under weather deck catwalks shall be completely enclosed in a steel enclosure, the bottom section of which shall consist of a removable perforated steel plate. Enclosures shall be constructed so as to permit periodic inspection and maintenance of cables and hangers.

5.3.3 Excessive heat. Installation of cables in locations subject to excessive heat shall be avoided. Where required, heat insulating barriers shall be installed. Cable shall not be installed adjacent to machinery, piping, or other surfaces having an exposed surface temperature greater than 70 °C. Cables shall not be run over boilers in the upper portions of firerooms or in other locations where they may be surrounded by hot air. Cables shall not be run in locations where they will be exposed to hot stack gases. Unless necessary to support ship arrangement requirements, fire detection and aqueous film forming foam (AFFF) system cabling shall not be routed in close proximity to engine and gas turbine exhaust piping. If the fire detection and AFFF cabling needs to be in proximity of engine and gas turbine exhaust piping, heat protection for the cabling shall be provided.

5.3.4 Excessive moisture. Cables shall not be installed in locations where they may be subjected to excessive moisture. Where cable routing near firemain, water, steam, oil, or other piping is unavoidable, drip-proof shields shall be provided for protection. Where cables must be installed in spaces subject to flooding, the cables shall be installed as high as practicable within the space.

## MIL-STD-2003-4B(SH)

5.3.5 Cables installed through submerged spaces and voids. Cables that would normally be submerged, except for cables in the sonar dome, shall be enclosed in a single pipe in a manner similar to that for cables passing through tanks. Cable runs in voids and other dead air spaces shall be avoided. If it is not practicable to avoid cable runs in such spaces, cables shall be installed only in those spaces which are not provided with a means for flooding, and then only when temperature calculations show that the spaces have sufficient radiation area to maintain an ambient temperature at or below the temperature in which the cable was selected to operate. Cables shall be supported clear of decks and bulkheads to avoid condensate which might form on such surfaces.

5.3.6 Cable installations in hazardous locations. Cable runs shall be avoided through hazardous spaces, such as the following (except such cable runs that terminate in or cannot be routed around these spaces):

- a. Compartments where hazardous materials are stowed, such as explosive signaling apparatus, ready service ammunition, chemical materials, film, paint, compressed oxygen, chlorine, and combustible gases.
- b. Diesel, JP-5, and fuel tanks and stowage compartments (stowage in separate tanks or containers).
- c. Gasoline hazard areas.
- d. Hangar spaces.
- e. LOX (liquid oxygen) handling and transfer spaces.
- f. Magazines.
- g. Missile magazines.
- h. Warhead, depth charge, mine charge, aerial bomb, and explosives magazines.
- i. Fire detection cabling and fire protection cabling transiting fire hazard spaces to serve adjacent spaces.

Cables within hazardous spaces shall be protected against mechanical damage. This protection shall be in the form of non-tight metal guards (expanded or solid) of sufficient strength to provide the required protection. Clearance shall be provided between the protective guards and the cables to provide ample ventilation. Protective guards shall be provided with drainage holes where required. Cables protected by the ship structure or by permanently installed equipment are considered adequately protected. Only cables having conductor insulation of silicone rubber (except for interior communication and weapons control cables totally within the compartment) shall be used. Through cables shall be of unbroken length within compartments.

5.3.7 Channel rubber. Channel rubber is used with banding straps and hose clamps in cableways to protect the outer jacket of cables from being cut and coaxial cables from being deformed by the banding strap or hose clamp. Cables such as coaxial, category, profibus, and other data and communication cables should be run in the middle of the cableway for increased mechanical protection.

5.3.7.1 Unarmored cable. For cableways that have unarmored cable in contact with banding straps, channel rubber is required in the following instances:

- a. For each banding strap of a vertical cableway.
- b. For each banding strap at a cableway bend, including breakout bends, and where the cableway changes direction.
- c. Before and after each cable penetration of a deck or bulkhead.
- d. For submarine external cableways.

5.3.7.2 Hose clamp retention devices. Where hose clamp retention devices are used (see Appendix 4C, C.4.4.1, [table 4CX](#)), channel rubber shall be required for unarmored cable under the following conditions:

- a. When coaxial, category, profibus, and other sensitive data and communication cable would otherwise be in contact with the hose clamp.
- b. On all vertical wireways.
- c. On a single hanger, if needed, to properly secure cables of varying diameters.
- d. On any cable hanger where the hose clamp could damage the cable, i.e., on a case-by-case basis.

## MIL-STD-2003-4B(SH)

5.3.7.3 Armored cable. Unless specified in this standard or in the applicable ship specifications, for cableways that have armored cable that is not in contact with the banding strap or hose clamp, channel rubber is not required. For cableways that have only armored cables in contact with the banding strap or hose clamp, channel rubber is not required unless the cable in contact with the banding strap or hose clamp is connected to sound isolated equipment.

5.4 Installation of propulsion system cables. Propulsion system cables shall be installed in cableways separate from those used for other electrical system cables. Direct current or alternating current propulsion system cables shall be arranged and installed in such manner as to minimize heating of adjacent structural material by induced currents. Alternating current propulsion cables installed on insulating hangers shall be grounded at approximately the midpoint of the cable run. Propulsion system cables shall not be installed in bilges. When cables are located near dripping water or oil, they shall be protected by drip covers. These protective covers shall be spaced away from the cables so as not to restrict ventilation. Cables entering propulsion system equipment from above or from the sides shall enter through stuffing tubes or other NAVSEA-approved watertight enclosure penetration device and shall be braced and secured to prevent dislodgment under vibration, shock, and magnetic stresses. The ends of propulsion system cables 9,000 circular mils and larger shall be sealed with solderless waterseal type lug terminals in accordance with MIL-T-16366 and MIL-STD-2003-1.

5.5 Cable handling and stowage. All cables except flexing service and silicone rubber insulated type of MIL-DTL-915, MIL-DTL-24643, and MIL-DTL-24640 shall be given the following special handling at temperatures below 35 °F:

- a. If the compartment in which the cable is to be installed cannot be heated, the cable shall first be stored in an ambient temperature of at least 50 °F but not above 120 °F until it is warm enough to be completely installed before it cools to 35 °F.
- b. If cable must be installed when its temperature is 35 °F or lower, extra care shall be taken. The radius of bends shall be not shorter than the minimum values as specified in 5.2. Before bending to the final radius, that portion of the cable comprising the bend shall be warmed thoroughly by a portable warm air blower.
- c. Cable shall be stored in a dry place that is not subject to accidental flooding, is protected from the weather, and is subjected to a minimum variation of temperature.
- d. Portable cables for aircraft servicing in accordance with MIL-DTL-32180 shall be stowed in bins. In hangar bay areas, they shall be stowed on cable racks.
- e. Cable that has been in storage for prolonged periods may be installed provided a visual inspection shows that it has sustained no mechanical damage that would impair the watertight integrity of its outer sheath.
- f. Cable armor showing signs of corrosion shall be cleaned and a coat of zinc-chromate primer applied to all corroded areas.

5.6 Cable tags and conductor wire markers. Applicable ship specification requirements for cable tags and wire markers shall be followed in addition to the requirements of this standard. All permanently installed cables shall be tagged, as closely as practicable, to each point of connection. For cables with both points of connection within a compartment and that can be readily traced, a single cable tag will suffice. All permanently installed cables shall be tagged on both sides of structural penetrations, except as follows:

- a. Where through cable runs within a compartment are direct (such as a vertical run between decks), a single tag will suffice.
- b. For multiple cable penetrations of decks and bulkheads (main cableways), individual cable tags may be omitted, and in lieu thereof, an identification plate shall be installed adjacent to the cableway penetration area showing each cable designation in the order of location in the penetration area.

Cable tags shall be in accordance with ship or class drawings. Typical power cable tags should be about  $\frac{1}{16}$  inch wide with length to suit the lettering on the tag. Capital letters shall be used on cable tags, height of all letters and numbers shall be not less than  $\frac{3}{16}$  inch, and letters and numbers shall be embossed to at least  $\frac{1}{64}$  inch above the surface.

## MIL-STD-2003-4B(SH)

5.6.1 Cable tag material and securing cable tags. Cable tags may be secured by using aluminum straps conforming to MIL-A-2877 (see 4.7) or by nylon strap conforming to SAE-AS33671, with the following exceptions:

- a. Metal cable tags and straps shall NOT be used external to the pressure hull on submarines.
- b. Metal cable tags and straps shall NOT be used in battery compartments.
- c. Nylon tags and straps shall NOT be used in reactor compartments.
- d. Nylon straps shall NOT be used in areas where the ambient temperature exceeds 70 °C.

Cable tags shall be secured with a minimum of two straps, except at cable splice locations at which three straps shall be used.

5.6.2 Conductor wire marking. Markings shall be applied in a permanent legible manner, resistant to water, oil and abrasion, and shall not be hand written. See MIL-STD-2003-5 for requirements for marking of conductors terminating into connectors. Use of flammable materials is prohibited. If shrinking phase marking, do not shrink over any portion of the terminal to ensure crimps can be seen. Tubing on conductors of single-phase cable need not be colored for phase-marking. Individual conductors shall be marked by one of the following methods:

a. Heat-shrinkable tubing with the markings permanently bonded to the tubing by a heating process. The tubing shall be in accordance with SAE-AS23053/5, class 1 or class 3, white, SAE-AS23053/4, class 2, SAE-AS23053/6, class 1, or SAE-AS23053/15, class 1.

b. Hot stamping (branding) insulating sleeving. Sleeving shall be in accordance with MIL-I-631, type F, grade A, form U, white.

5.7 Cable hangers and supports. Cable hangers and supports shall meet the following requirements:

- a. MIL-DTL-901 shock.
- b. MIL-STD-167-1 vibration.
- c. Minimum weight.
- d. Minimum maintenance on cable supporting systems.
- e. Facilitate cabling procedures.
- f. Convenience of servicing system.
- g. Fireproof.
- h. Material used is non-toxic.
- i. Free of sharp protrusions, corners, and items dangerous to personnel.
- j. Designed to permit repair with local market items. It is not intended that extensive back-up stocks be supplied for item by item replacement.
- k. Compatible with and non-damaging to cables.

5.7.1 Insulation spacer block. The use of insulation spacer blocks is mandatory for propulsion system cables in order to prevent bunching.

5.7.2 Shock design. All cable supporting arrangements shall be tested for resistance to shock and vibration. Deformation to supporting members and retaining members is satisfactory providing cables are prevented from becoming whips or missiles and retainers, racks, and supports do not become missiles. Shock and vibration tests shall be conducted at an approved laboratory. No mechanical damage shall occur to cable specimens, and insulation resistance shall comply with cable specifications before and after the testing. These tests shall be conducted by each manufacturer for each type hanger supplied. Retesting shall be required when design, manufacturing process, or material is changed. Testing of a hanger with lesser tiers or lesser dimensions and spacing shall not be extended or exempt from testing for other hangers. The cable supports, when tested, shall be loaded with maximum design cable load. Material is not satisfactory unless it has successfully passed these tests. Shock tests shall be in accordance with MIL-DTL-901, class I. Cable supporting devices shall be arranged for testing as specified in 5.7.2.1 and 5.7.2.2.

## MIL-STD-2003-4B(SH)

5.7.2.1 Multiple cable test racks (15 inches free length of cable support). If multiple cable racks are being tested for ability of cable support member only to withstand shock and vibration as fully loaded, a minimum of three supporting stations with 32-inch, 21-inch, or 16-inch spacing shall be provided. The maximum number of the largest cables that can be accommodated on these racks shall be applied. Cable overhang at each end shall be 16 inches or one-half the distance between supports. If tiers of multiple cable racks and supporting devices for attachments to the ship structure are to be tested for capability to withstand shock and vibration, a duplicate of the assembly proposed for shipboard installation with a minimum of three supporting stations with 32-inch, 21-inch, or 16-inch spacing shall be provided. The maximum number of the largest cables that can be accommodated on these racks shall be applied. Cable overhang at each end shall be 16 inches.

5.7.2.2 Single cable supports. All single cable supports shall be tested. These shall be arranged using a minimum of three supporting stations spaced 32 inches, 21 inches, or 16 inches apart. Cable overhang shall be 16 inches. Maximum size cables shall be mounted with these single cable supports. Two, three, or four cables shall be arranged for tests in a manner similar to that for single cables and supported using one of the methods shown on figures [4C1](#) through [4C12](#). A single tier of cables shall be arranged as described for multiple cable racks.

### 5.7.3 Installation.

5.7.3.1 Hanger loading, spacing, and tier limitations. These limitations apply unless there are specific exceptions in applicable ship specifications, in the individual figures in this standard, or as approved by NAVSEA.

The spacing of steel and aluminum cable supports shall be a maximum of 32 inches center to center along the cable run. Normally, the cable supports should not be spaced less than 16 inches apart to avoid installation of an excessive number of hangers. This spacing should be adjusted between 32 inches and 16 inches, as necessary, to suit particular ship conditions, with the following exceptions:

- a. If needed for headroom clearance under cableways (see applicable ship specifications for habitability and access requirements), the spacing of hangers may be 21 inches or less to reduce cable sag in cable racks.
- b. Hangers for overhead multiple tier aluminum cableways, when welded to aluminum decks, shall be spaced no more than 16 inches apart and the number of tiers shall be limited to three. If aluminum hangers or supports are being utilized from steel or structurally fire protected aluminum decks or bulkheads, a steel hanger or support or both shall be installed in lieu of an aluminum hanger or support every 5 feet, 4 inches as shown in [figure 4B37](#). The cable weight supported by each tier shall not exceed 45.5 pounds.
- c. Hangers for overhead multiple tier steel cableways, when welded to steel decks, shall be spaced 16 to 32 inches and the number of tiers shall be limited to five. The cable weight supported by each tier shall not exceed 91 pounds.
- d. Hangers for bulkhead mounted multiple tier cableways shall be spaced 16 inches to a maximum of 24 inches. The weight per tier shall not exceed 68 pounds for steel hangers and 45.5 pounds for aluminum hangers.
- e. The spacing of hanger supports adjacent to structural penetrations shall be a minimum of 16 inches and a maximum of 30 inches.
- f. For hard mounted equipment, the first cable support adjacent to the enclosure shall be located as close as practical to the equipment while maintaining the cable bend radius and the required cable slack. The following is given as a guide for determining the distance: multiply the largest cable diameter by nine, add the mounting distance (offset) from the center of the connectors to the center of the conductors at the first hanger, and add the diameter of each additional cable. See [figure 4C62](#) for illustration.  

$$(d_1 \times 9) + (\text{OFF}) + (d_2 + d_3 + \dots d_N) = \text{Distance to first hanger.}$$
- g. For resiliently mounted equipment, the first cable support adjacent to the enclosure shall be located to have a minimum cable length of 18 inches from the support to the entrance device with a slack of at least 3 inches or the distance the equipment is designed to travel under maximum shock, whichever is greater. The slack is designed to provide for flexibility and movement of the equipment under shock or vibration conditions. The spacing from the enclosure to the first cable support shall not exceed 32 inches.
- h. For gooseneck bends, the distance to the first support shall be the largest cable diameter multiplied by 15 or a maximum of 32 inches.

## MIL-STD-2003-4B(SH)

5.7.3.1.1 Cable supports for higher voltage cables. Due to the greater diameter and potentially greater stiffness of higher voltage rated cable (5 kilovolts and higher), the cable support spacing, cable bend radius, and cable support weight requirements for higher voltage cables may be different than the requirements in this standard. The cableway spacing, weight limitations, cable bend radius limitations, and any other cableway requirements for higher voltage cables shall be in accordance with the applicable ship specifications and NAVSEA approved ship drawings. [Figure 4C63](#) provides a typical installation of higher voltage cables in cableways. See 4.8 for cable bundling and ampacity requirements.

5.7.3.2 Cable racks. A maximum of five single tiers of cables may be supported from an overhead in one cable rack. Aluminum tiers shall be limited to three. A maximum of two tiers of cables may be supported from bulkheads in one cable rack. Eight tiers of double-banked cables may be supported in main cableways in machinery spaces and boiler rooms, when approved by NAVSEA. Backing plates are not required for cable support except that when bulkheads are  $\frac{1}{16}$  inch thick or less and cable run is over 4-inch width, backing washers shall be used. Multiple tiers of cable shall not exceed two on bulkheads except in congested locations, in which case three tiers may be used on request and subject to NAVSEA approval. Cable support angles shall be secured to ship structure by a weld of 180-degrees minimum except that in the following cases, the weld shall be 360 degrees:

- a. Where the number of tiers of 15-inch cable rows in wireway exceeds two.
- b. When welding to ballistic structure.
- c. When the welds are in wet spaces, such as weather decks or shower rooms.

5.7.3.2.1 Support components. Stainless corrosion-resistant steel cable standoffs and clamps shall be used for cableway installations outboard or in corrosion environment locations. Cable support components shall be of the following materials. Refer to 5.7.3.7 for requirements regarding the use of mounting fasteners.

Nonmagnetic vessels

<u>Inboard</u>	<u>Outboard</u>

	Ferrules – CRES or nylon

Appropriate method details specified as submarine only may be utilized for surface ship applications, particularly for weather deck, wet/humid areas, and hull applications. Aluminum cable supports may be attached to steel deck and bulkhead where suitable design and interface is approved. Cable hangers shall be bracketed away from deck and bulkhead surfaces in food handling and food storage spaces to permit spraying for insect control. Refer to 5.7.3.6 for requirements regarding the use of mounting fasteners.

5.7.3.3 Double banking of cable. Not more than one row of cables shall be installed on a cable hanger. Where space is limited, and if Supervisor approval has been obtained, double banking of cables on hangers is permitted; however, the clearance between the top of the upper layer of cables and the hanger above shall be at least  $\frac{3}{8}$  inch. Multiple banking of control and instrumentation cables is allowed provided sufficient order is maintained in the installation to prevent intertwining of the cables and to allow removal of any cables in the run without affecting other cables in the run. See 4.8 for potential derating requirements for grouping of cables to avoid overheating.

5.7.3.4 Cable retention. Devices for cable retention meeting the requirements of 5.7 and 5.7.2 are required on horizontal cable supports in multiple racks. Retention of cables on supports can be accomplished by the use of retainers, such as contour straps, soft iron flat bars bent over the cables, semi-contour straps, or angle iron retainers. Non-toxic strips or channel material shall be used with semi-contour straps, bars, and angle retainers to reduce cable damage, distortion, and chafing. On cable runs in which the cable is vertical, cable retention is required at every hanger.

- a. Cable retention spacing shall be as specified in 5.7.3.1.
- b. Cable straps shall be omitted on horizontal cable runs except as follows:
  - (1) Where the hanger has no side brackets.
  - (2) At those locations where the cable runs change direction or pass through beams or bulkheads.
  - (3) Where four consecutive hangers would not require straps. In this case, a minimum of one strap shall be installed on every fourth hanger.
- c. Marine snaplock type cable clamps may be used. See Appendix 4C, C.4.4.1, [table 4CX](#).
- d. See Appendix 4C for further requirements for cable retention.

5.7.3.5 Plastic sealer. After the cables are properly secured, plastic sealer electrical insulation, MIL-I-3064, type HF, shall be used to seal the space around the cable as follows:

- a. In cable clamps and bushings entering the top or side, with no drip loop, of an electrical enclosure.
- b. In bushings, collars, or nipples used for passing cables through light-tight and fume-tight bulkheads.

5.7.3.6 Welding. Welding shall be in accordance with S9074-AR-GIB-010/278, T9074-AD-GIB-010/1688, MIL-STD-22, and MIL-STD-1689.

5.7.3.7 Fasteners used in cableways. Fasteners used in cableway components shall be in accordance with fastener requirements in MIL-STD-2003-2.

5.7.3.8 Collar and all weld studs. Collar and all weld studs shall be in accordance with MIL-S-24149.

## MIL-STD-2003-4B(SH)

5.7.3.9 Bimetallic joints. Bimetallic joints in accordance with MIL-J-24445 may be used to secure aluminum or steel cable hangers to dissimilar decks or bulkheads in lieu of other methods identified for dissimilar materials. Sources for bimetallic bonding material are E.I. Dupont Denemours Co., Inc., Revere Copper, and Brass Co., North Technical Industries, Inc., or equal (see 4.3).

## 6. NOTES

(This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.)

6.1 Intended use. This standard specifies the requirements for submarine and surface ship cableways and protection methods to be employed both on surface ships and submarines. Standard methods identified for electric plant installation are intended for new construction, conversion, and alteration of existing ships. The use of this standard will be specified in the contract, ship specifications, and similar implementing documents (such as COMUSFLTFORCOMINST 4790.3, Joint Fleet Maintenance Manual (JFMM) and S9086-KC-STM-010/300, Naval Ships' Technical Manual Chapter 300, Electric Plant-General).

6.2 Acquisition requirements. Acquisition documents should specify the following:

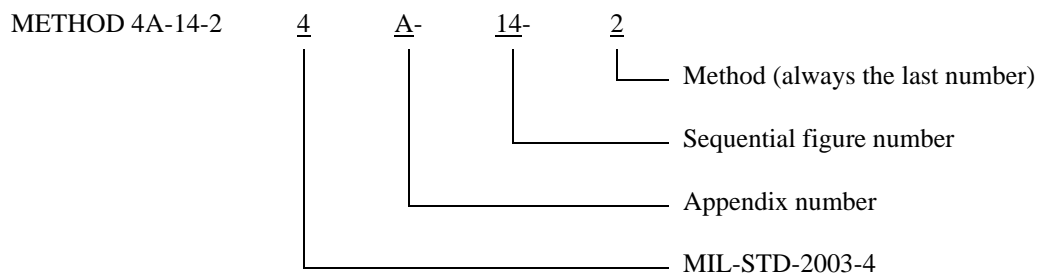

- a. Title, number, and date of this standard.

6.3 Designation of electric plant installation standard methods figures. MIL-STD-2003-4 contains drawings that depict standard methods that are applicable for general electric plant installation on both surface ships and submarines. Each drawing has been assigned a figure number. The methods shown on the figures are grouped together in the following appendices to this standard. Each appendix provides requirements for similar functions.

MIL-STD-2003-4 (Cableways)

- A. Cableways (Submarines) (Appendix 4A)
- B. Cableways (Surface Ships) (Appendix 4B)
- C. Cableways (General) (Appendix 4C)
- D. Cable Protection (Appendix 4D)

The methods shown on the figures are identified by the following alphanumeric designation system:

Thus, method 4A-14-2 identifies method 2, figure 14 in Appendix 4A of MIL-STD-2003-4.

6.4 Subject term (key word) listing.

MIL-STD-2003-4B(SH)  
APPENDIX 4A

APPENDIX 4A – CABLEWAYS (SUBMARINES)

A.1 SCOPE

A.1.1 Scope. This appendix describes standard methods for the installation of cableways on submarines. This appendix is a mandatory part of the standard. The information contained herein is intended for compliance.

A.2. APPLICABLE DOCUMENTS

A.2.1 General. The documents listed in this section are specified in this appendix. This section does not include documents cited in other sections of this standard or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in this appendix, whether or not they are listed.

A.2.2 Government documents.

A.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-PRF-6855	- Rubber, Synthetic, Sheets, Strips, Molded or Extruded Shapes, General Specification for
MIL-DTL-12133	- Washer, Spring Tension, General Specification for
MIL-T-16420	- Tube, Copper-Nickel Alloy, Seamless and Welded (Copper Alloy Numbers 715 and 706)
MIL-S-22698	- Steel Plate, Shapes and Bars, Weldable Ordinary Strength and Higher Strength: Structural
MIL-S-24149	- Studs, Welding, and Arc Shields (Ferrules), General Specification for
MIL-S-24149/1	- Stud, Welding, and Arc Shields (Ferrules); Type I, Class 1, 2, 3, and Type II, Class 1, 4, 5, 5A, 6, Carbon Steel, for Direct Energy Arc Welding
MIL-S-24149/2	- Studs, Welding, and Arc Shields (Ferrules); Type III, Class 1, 2, 3, and Type IV, Class 1, 2, 3, 4, 5, 6, Aluminum Alloy, for Direct Energy Arc Welding
MIL-S-24149/3	- Studs, Welding, and Arc Shields (Ferrules); Type V, Class 1, 4, 5, 5A, Corrosion-Resistant Steel, for Direct Energy Arc Welding
MIL-P-24691/3	- Pipe and Tube, Corrosion-Resistant, Stainless Steel, Seamless or Welded

A.2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

### A.3 REQUIRED EQUIPMENT AND MATERIALS

A.3.1 Required equipment and materials. The equipment and materials in the tables and referenced in the text of this section shall be used for the installation of cableways on submarines. For fiber optic cable, refer to MIL-STD-2042-4. Refer to 5.7.3.7 for requirements regarding the use of mounting fasteners.

### A.4 NOTES AND PROCEDURES

A.4.1 Dimensions. For figures and tables in this appendix, all dimensions are in inches unless otherwise noted.

A.4.2 Figures. [Table 4AI](#) provides information for the figures in this appendix. The details and methods shown on figures [4A1](#) and [4A2](#) specifically support the installation of battery cables on submarines; however, they may be used for general installations where applicable.

TABLE 4AI. Figures for cableway installations on submarines.

Figure number	Title	Page
4A1	Main cableway for battery cables (submarines)	27
4A2	Main cableway for battery cables (submarines)	28

A.4.3 Internal wireway installation. Figures [4A1](#) through [4A12](#) may be used for installation of submarine internal wireways, as applicable.

a. The maximum cable hanger center separation that is qualified to withstand a high-impact shock environment is 16 inches. Where the number of cables to be supported would cause the maximum size of support shown to be exceeded, additional wireways shall be provided.

b. Dimensions and national stock numbers (NSNs) for angle collar studs used on figures [4A1-4A3](#), [4A6-4A9](#), [4A11](#), and [4A12](#) are listed in [table 4AII](#). These tables are for user information to provide stock numbers for individual parts. The technical requirements in the figures in this appendix shall be met.

A.4.4 Submarine external wireway installation. [Figures 4A13](#) through [4A25](#) provide guidelines for the installation of all cabling external to the submarine hull. The figures illustrate the methods to be used for protecting and securing the cabling from an outboard appliance to an electrical hull fitting. These methods are not applicable to submarine antennae and mast assemblies.

- a. Cables shall be completely protected for their entire length by the methods shown.
- b. Radii of the cable bends shall be at least ten (10) times the diameter of the cable where possible.
- c. Outboard cable identification tags shall be comprised of nylon cable straps with nylon identification plates attached conforming to SAE-AS23190 and SAE-AS33681 (see [table 4AV](#), items 56 and 57). Identification tags shall be indelibly marked with  $\frac{3}{16}$ -inch lettering.
- d. All sharp edges shall be rounded, and all burrs shall be removed.
- e. Banding straps shall be installed so as not to deform the cable sheath but shall be tightened sufficiently to preclude loosening of cable under environmental conditions. To prevent corrosion of the banding straps, the banding strap material and banding buckle material shall be either nylon coated CRES 304 (preferred) or CRES 316. Nylon coated CRES 304 material is preferred due to superior corrosion resistance.
- f. Channel rubber shall be used in all cases between cables and banding straps in a manner to prevent any possible contact between the banding straps and the cables.
- g. Enough cable slack shall be allowed for one complete turn around the hull fitting cable rack assembly. Where cable is shortened due to initial molding error, the cable shall be installed in the rack as shown on [figure 4A23](#). All cable slack shall be taken up on the cable rack around the hull fitting. There shall be no slack in the cable pans. See [figure 4A23](#).
- h. Cable pans, angle bar, and tubing shall be mounted from the hull or frame at each frame space or 3-foot maximum spacing and no more than 6 feet from the ends. Cables in pans shall be banded through each slot provided and banding shall be spaced not more than 16 inches apart. Cable angle bars shall be banded every 12 inches. Cables shall not sag. Covers shall be double banded every 16 inches. All welding shall be on frame lines only. Banding of cables on angle bar wireways and cable pans shall be one turn minimum.
- i. All cable pan and angle bar runs shall be continuous and shall be broken only as indicated on the ship's installation plan.

MIL-STD-2003-4B(SH)  
APPENDIX 4A

- j. The cable pan, angle bars, mounting brackets, and tubing shall be painted in accordance with the material requirements of the submarine painting schedule.
- k. Cable pan covers shall be installed at all times except during installation of cables in the pans. Cable pans shall be clean of all foreign matter prior to installation of cables.
- l. Tubing shall not be used except in special installations where specified.
- (1) The radius of tubing bending shall be a minimum of ten (10) times the diameter of the cable installed, where practicable.
- (2) Tubing support clamps shall be assembled without rubber lining. Weld as shown for tubing support clamp assembly, [figure 4A13](#).
- (3) Rubber shall be inserted into tubing (2 inches minimum) and folded back 2 inches over tubing. Tubing shall not be flared. Remove all sharp edges. The rubber shall be held in back with a tubing support clamp. A piece of ¼-inch by 2-inch flat-bar shall be welded to the top half of the clamp. The thickness of the rubber and size of the clamp depends on the size of the tubing and cables in it. There shall be no mounting leg on clamps.
- A.4.4.1 Bonding instructions for cable pan channel rubber (piece 19 of [table 4AV](#)).
- Solvent wipe the edges of the cable pan in the area to be bonded with a solvent approved for shipboard use.
  - Apply a coat of primer by brushing and allow between 2 and 36 hours drying time at room temperature.
  - Solvent wipe the area to be bonded of the channel rubber insert with a solvent approved for shipboard use.
  - After primer areas are dry, brush apply a coat of adhesive to both the metal and channel rubber surfaces to be bonded. After a 20- to 30-minute drying time, join the surfaces of the channel rubber and the pan.
- A.4.4.2 Welding. All welding shall be in accordance with 5.7.3.6.
- A.4.4.3 Part numbers. Piece numbers referred to in [figures 4A13](#) through [4A25](#) are from [table 4AV](#). Quantities shall be as required for the installation.

APPENDIX 4A

METHOD 4A-3-1  
ADDITION OF CABLES TO EXISTING BATTERY CABLEWAY

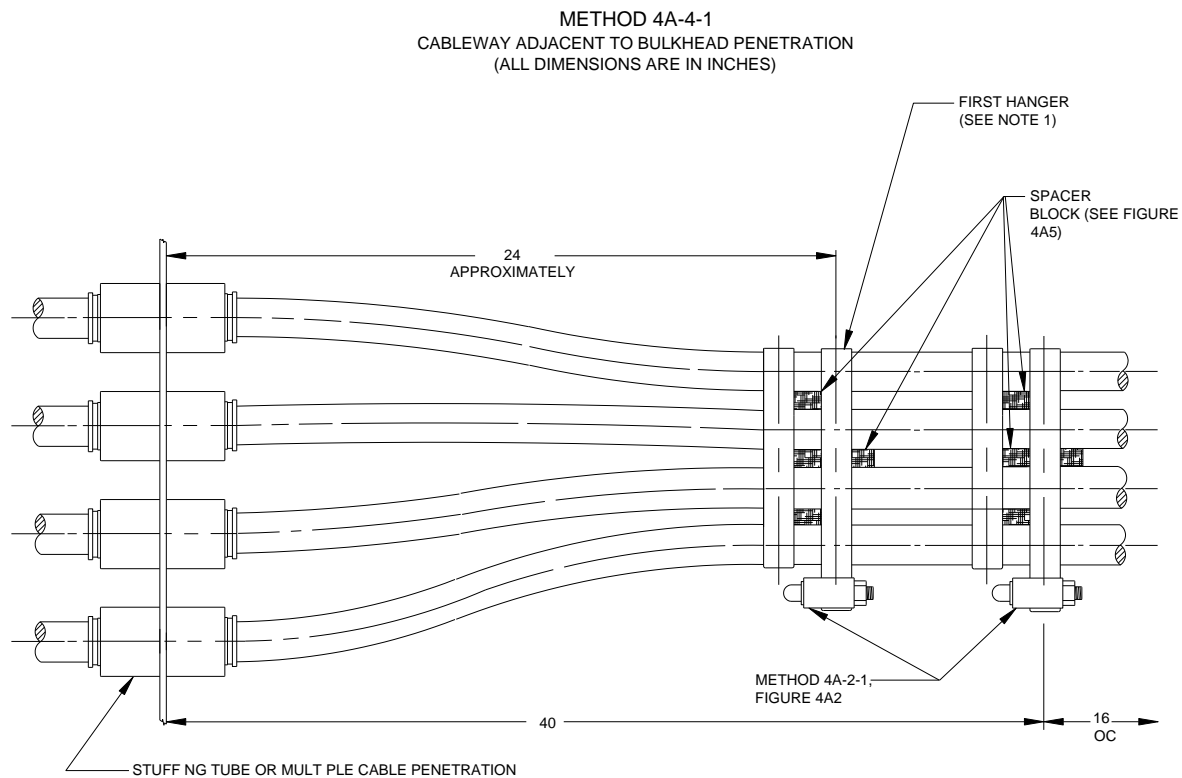

NOTES:

1. See A.4.3 for general installation information.
2. See 5.7.3.8 for collar and welding stud requirements.
3. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4A3. Addition of cable to existing battery cableway (submarines).

MIL-STD-2003-4B(SH)  
APPENDIX 4A

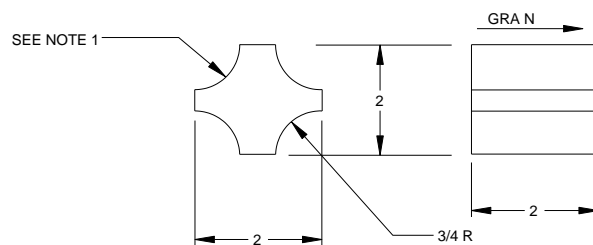

NOTES:

1. The first hanger next to the bulkhead shall be located to suit cable bends at penetration but shall not exceed 32 inches.
2. See 5.7.3.8 for collar and welding stud requirements.

FIGURE 4A4. Cableway adjacent to bulkhead penetration (submarines).

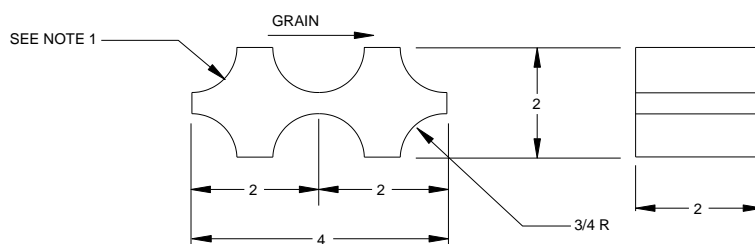

MIL-STD-2003-4B(SH)  
APPENDIX 4A

METHOD 4A-5-1  
SPACER BLOCK  
FOR FOUR CABLES

ALL DIMENSIONS ARE IN INCHES

METHOD 4A-5-2  
SPACER BLOCK  
FOR SIX CABLES

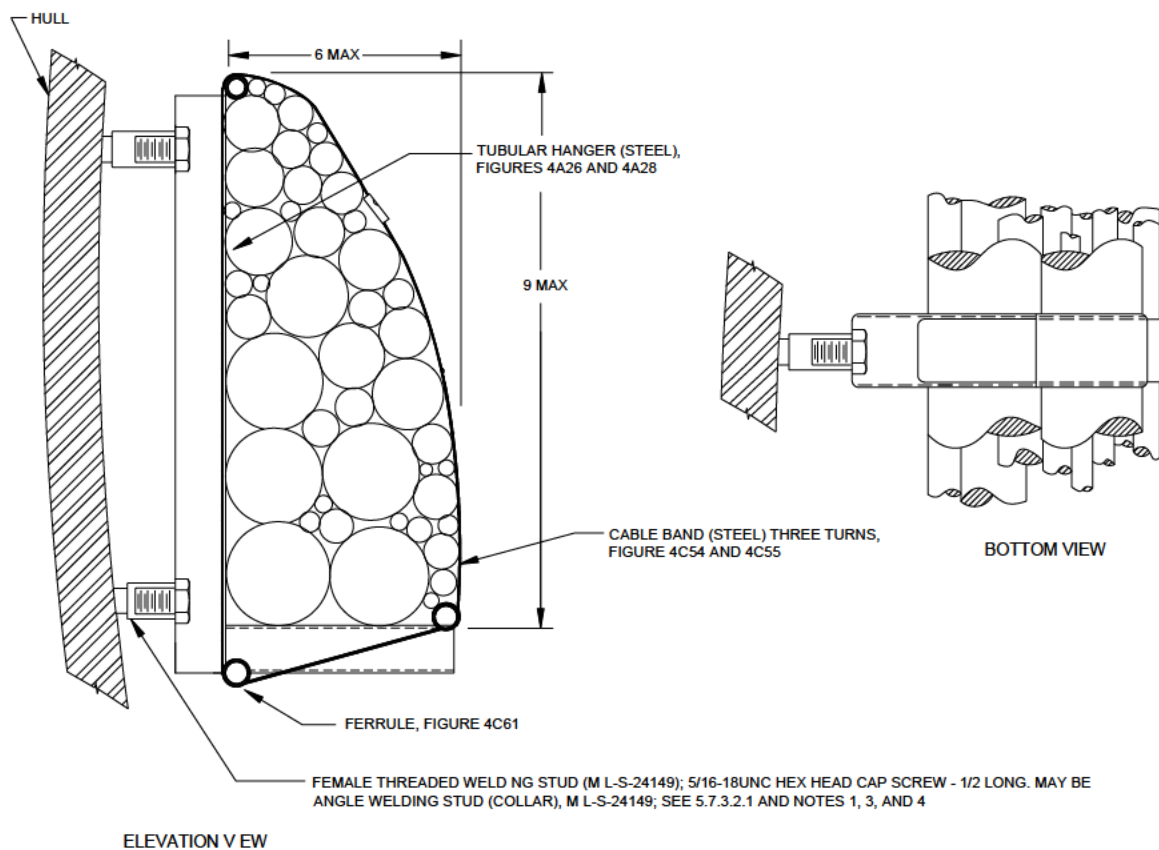

NOTE:

1. Material may be maple wood finished with two coats of marine varnish or melamine in accordance with ASTM D704.

FIGURE 4A5. Spacer blocks for submarine cableways.

MIL-STD-2003-4B(SH)  
APPENDIX 4A

METHOD 4A-6-1  
CABLE BANKS SUPPORTED BY WELD NG STUDS ON HULL WITHOUT INSULATION

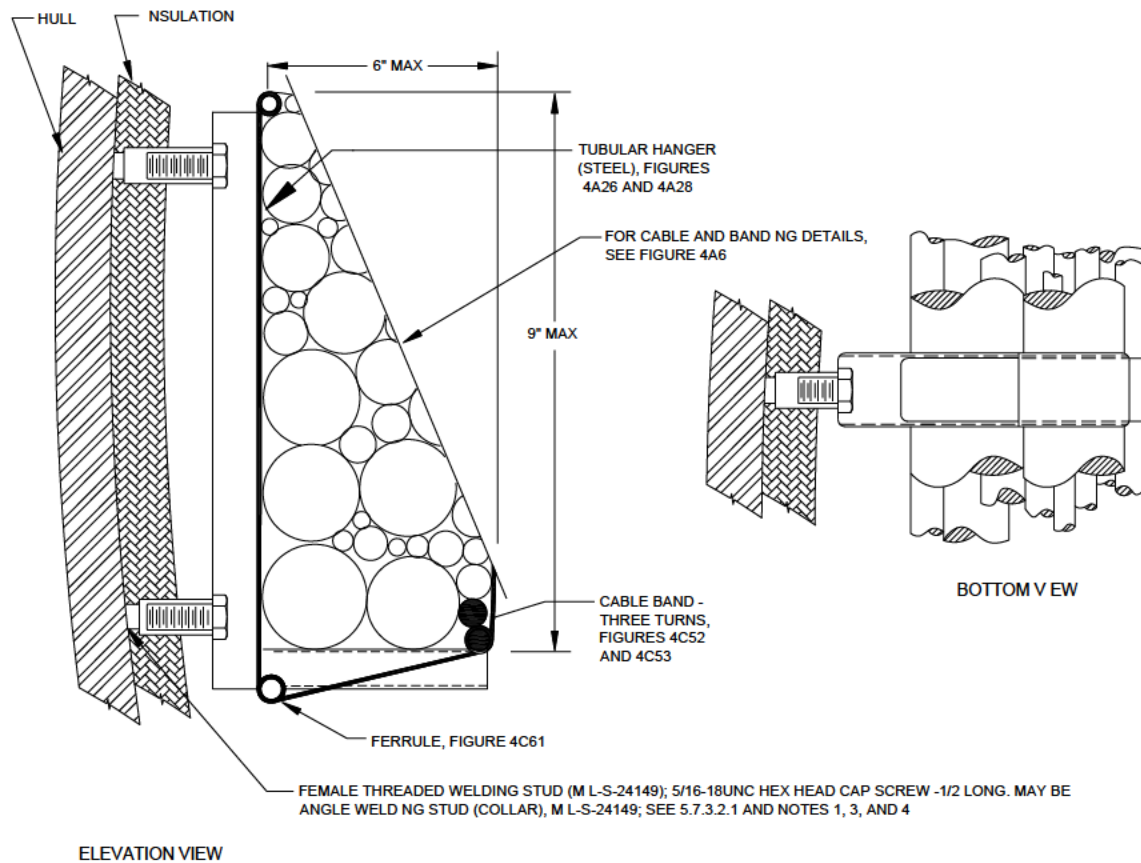

NOTES:

1. See A.4.3 for general installation information.
2. Cables shall be arranged so that the larger cables are in the center of the hanger, if possible.
3. See 5.7.3.8 for collar and welding stud requirements.
4. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4A6. Cableway for auxiliary cables (submarines).

MIL-STD-2003-4B(SH)  
APPENDIX 4A

Method 4A-14-1  
External Wireway  
Angle Bar Cable Support

EXTERNAL WIREWAY DETAILS

NOTES:

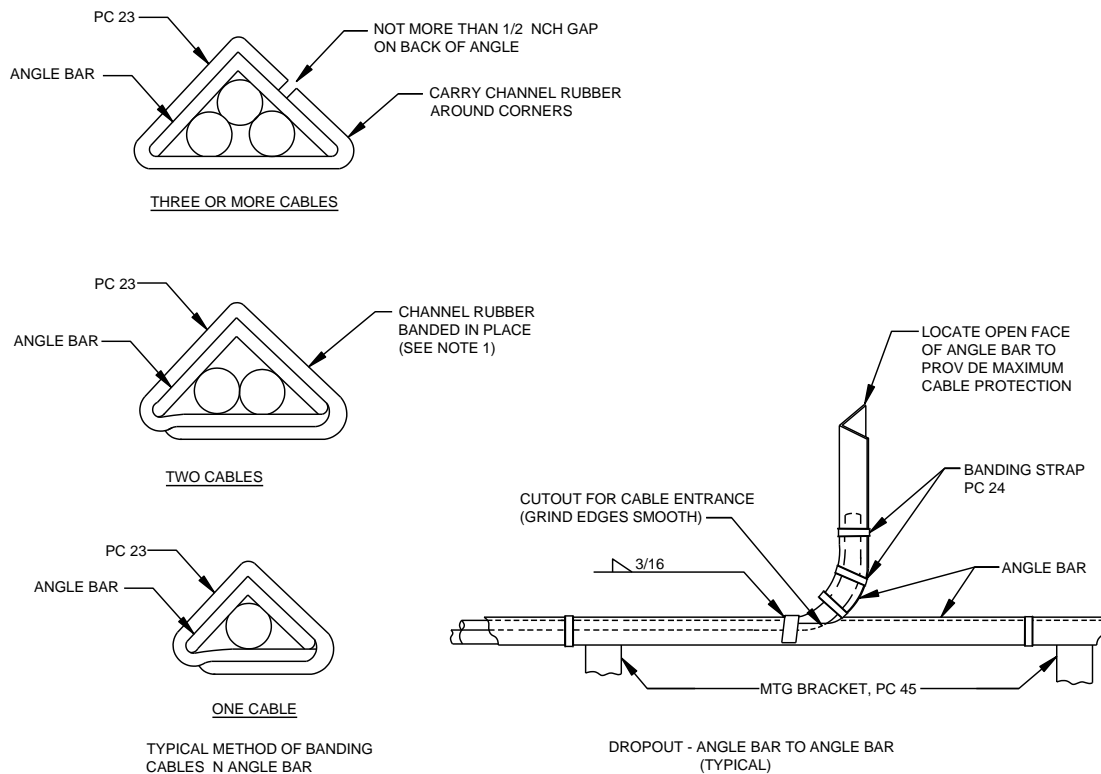

1. See A.4.4 for general installation information. See List of Material in [table 4AV](#) for details on piece numbers referenced on this figure.
2. Angle bar (PCs 20 and 21) shall be mounted from the hull or frame at each frame space or 3-foot maximum spacing and no more than 6 feet from the ends. Cable angle bars shall be banded every 12 inches. Cables shall not sag. All welding shall be on frame lines only. Banding of cables on angle bar wireways and cable pans shall be one turn minimum.
3. Angle bar runs shall be continuous and shall be broken only as indicated on ships' installation plans. Channel rubber (PC 23) shall be used in all cases between cables and banding straps in a manner to prevent any possible contact between the banding straps and the cables.
4. Mounting brackets (PC 45), type A, shall be staggered from each other. Staggering means that the flat bar brackets are not to be installed directly across from each other, but should be staggered left and right along the angle bar cable run.

FIGURE 4A14. External wireways installation (submarines).

Method 4A-16-1  
External Wireway  
Cable Pan Support

EXTERNAL WIREWAY DETAILS

NOTES:

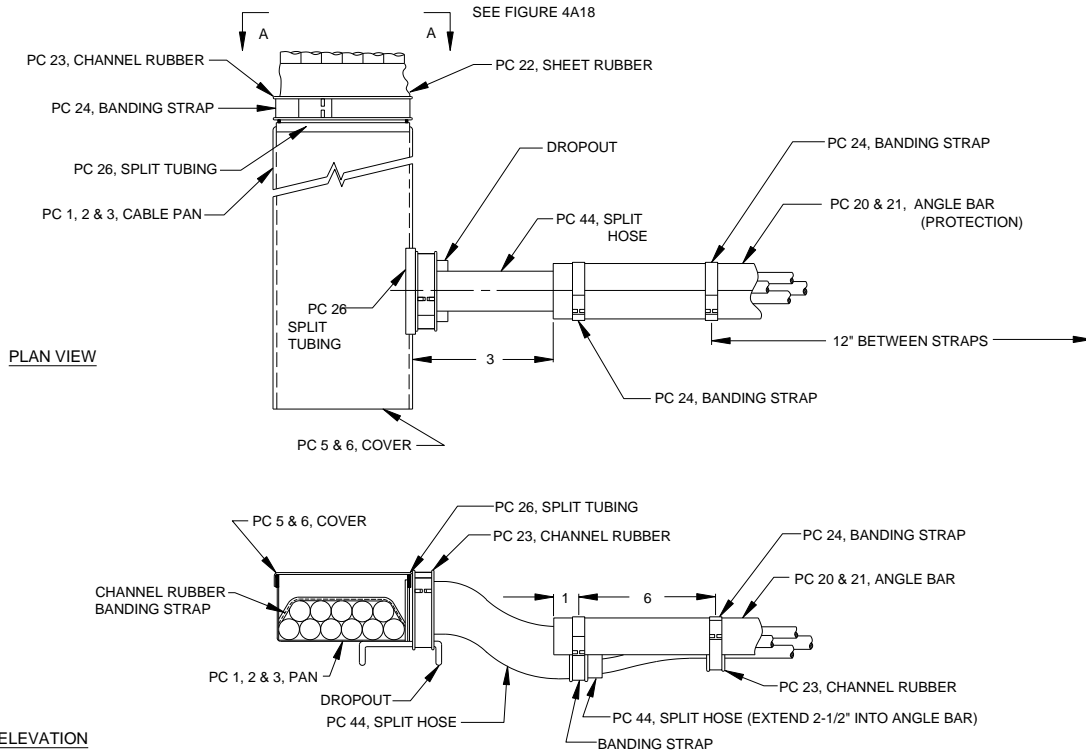

1. See A.4.4 for general installation information. See List of Material in [table 4AV](#) for details on piece numbers referenced on this figure. See [table 4AVI](#) and [table 4AX](#) for dimensions in this figure.
2. Cables shall be completely protected for their entire length by the methods shown.
3. Cable pans (PCs 1 through 3) shall be mounted from the hull or frame at each frame space or 3-foot maximum spacing and no more than 6 feet from the ends. Cables in pans shall be banded through each slot provided and banding shall be spaced not more than 16 inches apart. Cables shall not sag. Covers shall be double banded every 16 inches. All welding shall be on frame lines only. Banding of cables on angle bar wireways and cable pans shall be one turn minimum.
4. Cable pan covers shall be installed at all times except during installation of cables in the pans. Cable pans shall be clean of all foreign matter prior to installation of cables.
5. All cable pans shall be continuous and shall be broken only as indicated on the ship's installation plan.

APPENDIX 4B – CABLEWAYS (SURFACE SHIPS)

B.1 SCOPE

B.1.1 Scope. This appendix establishes procedures for the installation of cableways on surface ships. This appendix is a mandatory part of the standard. The information contained herein is intended for compliance.

B.2. APPLICABLE DOCUMENTS

B.2.1 General. The documents listed in this section are specified in this appendix. This section does not include documents cited in other sections of this standard or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in this appendix, whether or not they are listed.

B.2.2 Government documents.

B.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-DTL-901	- Shock Tests, H.I. (High-Impact) Shipboard Machinery, Equipment, and Systems, Requirements for
MIL-I-3064	- Insulation, Electrical, Plastic-Sealer
MIL-PRF-23236	- Coating Systems for Ship Structures
MIL-S-24149	- Studs, Welding, and Arc Shields (Ferrules), General Specification for
MIL-S-24235	- Stuffing Tubes, Metal, and Packing Assemblies for Electric Cables, General Specification for
MIL-S-24235/9	- Stuffing Tubes, Metal, and Packing Assemblies for Electric Cables, Brass and Steel, for Decks and Bulkheads with Pipe Protection

DEPARTMENT OF DEFENSE STANDARDS

MIL-STD-167-1	- Mechanical Vibrations of Shipboard Equipment (Type I - Environmental and Type II - Internally Excited)
MIL-STD-2003-1	- Electric Plant Installation Standard Methods for Surface Ships and Submarines (Cable)
MIL-STD-2003-3	- Electric Plant Installation Standard Methods for Surface Ships and Submarines (Penetrations)
MIL-STD-2003-5	- Electric Plant Installation Standard Methods for Surface Ships and Submarines (Connectors)
MIL-STD-2042-4	- Fiber Optic Cable Topology Installation Standard Method for Surface Ships and Submarines (Cableways)

B.2.4 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

### B.3 REQUIRED EQUIPMENT AND MATERIALS

B.3.1 Required equipment and materials. The equipment and materials referenced in the text of this section shall be used for the installation of cableways on surface ships. For fiber optic cable, refer to MIL-STD-2042-4. Refer to 5.7.3.7 for requirements regarding the use of mounting fasteners.

### B.4 NOTES AND PROCEDURES

B.4.1 Dimensions. For figures and tables in this appendix, all dimensions are in inches unless otherwise noted.

B.4.2 Figures. [Table 4BI](#) provides information for the figures in this appendix.

**B.4.3 Details for cableways for A.C. propulsion cables on surface ships.**

**B.4.3.1 Heat dissipation.** Where cables enter propulsion electrical equipment, care shall be exercised to avoid bunching or closely grouping the cables in any manner that may restrict dissipation of heat from the cables. See 4.8.

**B.4.3.2 Phase arrangements.** Phase arrangements as shown in [table 4BII](#) shall apply to horizontal, vertical, or inclined wireway runs. Any arrangements of cables other than shown shall be specifically approved by NAVSEA.

NOTE: Where “Inverted T” type hangers are used, the downcomer shall not separate any of the phase groups.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

TABLE 4BII. Cable arrangement and phase relationship.  
(see figures [4B1](#) through [4B13](#))

One group – one tier			Two groups – one tier					
A	B	C	A	B	C	C	B	A
One group – two tiers			Two groups – two tiers					
A	B	C	A	B	C	C	B	A
A	B	C	A	B	C	C	B	A
One group – three tiers			Two groups – three tiers					
A	B	C	A	B	C	C	B	A
C	A	B	C	A	B	B	A	C
B	C	A	B	C	A	A	C	B

B.4.3.3 Separation of propulsion cables. Propulsion cables in wireways shall be run separate from other cables.

B.4.3.4 End sealing. When non-watertight cable is approved for use, ends shall be water-sealed by terminating in water-seal solderless lugs in accordance with MIL-STD-2003-1, Appendix 1A, "Cable Preparation and End-Sealing".

B.4.3.5 Use of stuffing tubes for propulsion cables. Where cables to propulsion equipment are required to enter through stuffing tubes, the cables and stuffing tubes shall be installed in accordance with MIL-STD-2003-3.

B.4.3.6 Phase marking of single conductor cables. In order to ensure that the proper arrangement of single conductor cables is maintained, the phase of single conductor cables shall be indicated at suitable intervals along the length of each cable and at the extremities.

B.4.3.7 Cable support mounting. Unless otherwise approved, no cable support shall be mounted in such a manner as to be directly connected to strength frames or beams, particularly where near the skin of the ship and at or below the waterline.

B.4.3.8 Temperature limit exposure. Avoid running propulsion cable wireways in locations where ambient temperatures exceed 50 °C during operation.

B.4.3.9 Hanger spacing. Hangers shall be spaced at intervals of not more than 16 inches on center.

B.4.3.10 Cable slack for shock and vibration. Cables shall have sufficient slack when entering equipment for shock excursion (MIL-DTL-901) and vibration (MIL-STD-167-1). Cable bend radii shall be in accordance with 5.2.

B.4.4 Detail cable arrangements for D.C. propulsion cables on surface ships.

B.4.4.1 Minimizing external magnetic fields. The methods shown indicate the recommended arrangements of direct current single-conductor propulsion cables in wireways to reduce, to a minimum, external magnetic fields due to the propulsion current. Each method illustrates the arrangement of cables for one circuit consisting of a positive and a negative leg, each leg containing two or more single conductor cables in parallel. Whenever practicable, each circuit should contain an even number of single conductor cables per leg in preference to an odd number per leg.

B.4.4.1.1 Arrangements. The detail arrangements apply to horizontal, vertical, or inclined wireways. When several propulsion circuits are installed in one wireway, each circuit shall be arranged as indicated. The circuits may be located adjacent on the same hanger or hangers, or separated on individual hangers.

B.4.4.1.2 Parallel cables. The external magnetic fields due to direct current in double conductor cables are relatively small if the two conductors in each cable are connected to carry current of opposite polarity. Accordingly, when several double-conductor cables are used in parallel, the two conductors in each cable shall be of opposite polarity.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

TABLE 4BIII. Maximum allowable current capacities for D.C. propulsion cables in wireways and racks – individual adjacent cables on each hanger without spacing.

Number of hangers (horizontal or vertical)	Percentage of current ratings specified in MIL-HDBK-299 (at 50 °C ambient) (see B.4.3.8)			
	Individual cables on each hanger adjacent without spacing			
	Cables in horizontal hangers next to bulkheads without insulation	Cables in horizontal hangers next to bulkheads with insulation	Cables in horizontal hangers under decks without insulation or in vertical hangers next to bulkheads without insulation	Cables in horizontal hangers under decks with insulation or in vertical hangers next to bulkheads with insulation
1	95	90	90	80
2	85	80	80	70
3	80	75	70	65

TABLE 4BIV. Maximum allowable current capacities for D.C. propulsion cables in wireways and racks – individual cables on each hanger spaced ½ inch apart.

Number of hangers (horizontal or vertical)	Percentage of current ratings specified in MIL-HDBK-299 (at 50 °C ambient) (see B.4.3.8)			
	Individual cables on each hanger spaced ½ inch apart			
	Cables in horizontal hangers next to bulkheads without insulation	Cables in horizontal hangers next to bulkheads with insulation	Cables in horizontal hangers under decks without insulation or in vertical hangers next to bulkheads without insulation	Cables in horizontal hangers under decks with insulation or in vertical hangers next to bulkheads with insulation
1	100	95	100	95
2	100	95	100	95
3	95	90	95	90

B.4.4.1.3 Connection to terminals. Cable connections to the terminals of electrical equipment shall be accomplished with a minimum amount of fanning of the individual conductors. Loops formed by conductors of opposite polarity should be reduced in area to a minimum and avoided wherever possible. When unavoidable, the plane of the loop formed by the conductors of opposite polarity in each circuit should lie vertical in preference to horizontal.

B.4.4.2 Polarity marking of single conductor cables. In order to ensure that the proper arrangement of single conductor cables is maintained, the polarity of single conductor cables shall be indicated at suitable intervals along the length of each cable and at the extremities.

B.4.4.3 Allowable current capacities. [Tables 4BIII](#) and [4BIV](#) provide allowable current capacities for D.C. propulsion cables in wireways and racks. For propulsion cables in enclosed ducts, cables shall be rated at 50 percent of the values listed in the tables. The ratings in the tables are based on four or more cables on each hanger. For less than four cables per hanger, an additional 5 percent increase in the percentages specified in the tables is permissible.

B.4.4.4 Separation in wireways. Propulsion cables in wireways shall run separate from other cables, where practicable.

B.4.4.5 Retention in wireways. Propulsion cables shall be adequately clamped or strapped to avoid loosening or dislodgement due to vibration, shock, or magnetic stresses.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

B.4.4.6 Temperature limit exposure. Avoid running propulsion cable wireways in location where ambient temperatures exceed 122 °F (50 °C) during operation, as in the vicinity of boilers, evaporators, steam-pipes, etc.

B.4.4.7 Dissipation of heat. Where cables enter propulsion electrical equipment, care shall be exercised to avoid bunching or closely grouping the cables in any manner that may restrict dissipation of heat from the cables. See 4.8.

B.4.4.8 End sealing. When non-watertight cable is approved for use, the ends of propulsion cables shall be adequately sealed by approved methods to avoid the entrance of water or moisture.

B.4.4.9 Other details. Details not specifically covered in D.C. propulsion cableway installation methods covered in this standard shall be in accordance with the applicable standard methods.

B.4.4.10 Cable slack for shock and vibration. Cables shall have sufficient slack when entering equipment for shock excursion (MIL-DTL-901) and vibration (MIL-STD-167-1). Cable bend radii shall be in accordance with 5.2.

B.4.5 Hanger spacing, tiers, and weight. Spacing, number of tiers, and cable weight shall not exceed the values specified in 5.7.3.1. Downward extension to the lesser condition of fewer tiers for hanger assemblies (with cable load not exceeding the maximum per tier as specified in 5.7.3.1) is acceptable.

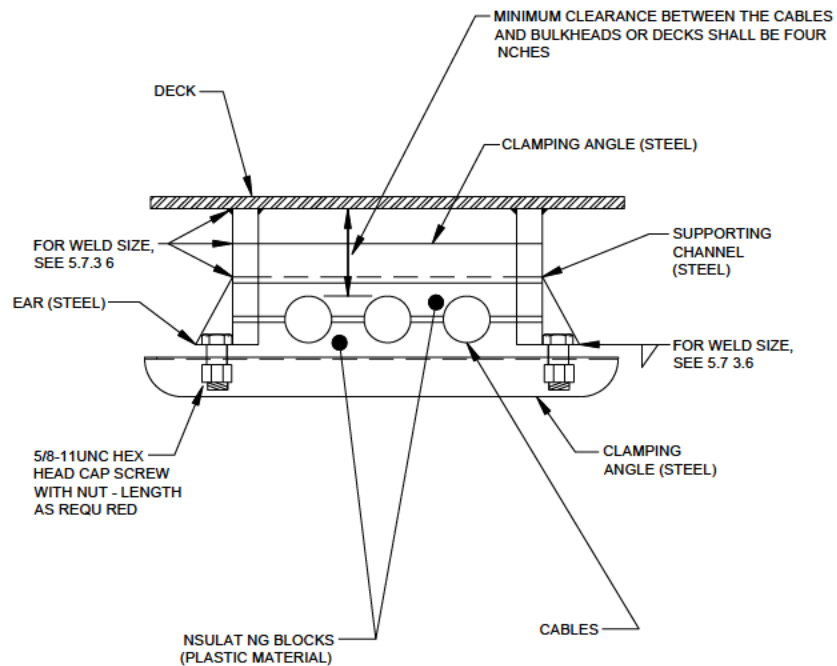

B.4.5.1 Corrosion protection. Contact areas between adapter, downcomer, and attaching bolts shall be painted with two coats of primer in accordance with MIL-PRF-23236.

B.4.5.2 Banding below cable support bar. Cables may be banded below cable support bars on overhead mounted cable hangers, provided they are banded separately from the banding for cables over the support bar and the total weight does not exceed the cable hanger tier weight limits in 5.7.3.1. See method 4B-20-5 in [figure 4B20](#) for additional detail on bottom loading of hangers. Bottom loaded cables shall not come in contact with sharp surfaces that could cause damage to the cable.

B.4.6 Mounting aluminum hangers on steel decks. For mounting aluminum hangers on steel decks, the steel (ASTM A501/A501M) adapter, detailed on [figure 4B33](#), shall be used. Contact areas between the adapter, downcomer, and attaching bolts shall be painted with two coats of primer in accordance with MIL-PRF-23236.

**FIGURE 4B19. Cableways in acoustical locations (surface ships).**

MIL-STD-2003-4B(SH)  
APPENDIX 4B

NOTES:

1. Spacing, number of tiers, and cable weight shall not exceed the values specified in 5.7.3.1. Downward extension to the lesser condition of fewer tiers for hanger assemblies (with cable load not exceeding the maximum per tier as specified) is acceptable.
2. Sharp corners shall be slightly rounded. All parts shall have smooth surfaces.
3. Contact areas between adapter, downcomer, and attaching bolts shall be painted with two coats of MIL-PRF-23236 primer.
4. See 5.7.3.9 for an alternate method of securing cableway hangers to dissimilar metals.
5. Cables may be banded below cable support bars on overhead mounted cable hangers. See B.4.5.2 for specific requirements for installing cables below cable support bars. See method 4B-20-5 for additional detail on bottom loading of hangers.
6. See 5.7.3.7 for fastener and fastener material requirements.
7. See [figure 4B21](#) for tier bar and downcomer design. See [figure 4B22](#) for an alternate tier bar design.

FIGURE 4B20. Multiple cableways on decks and bulkheads (surface ships).

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-20-2  
Trapeze Cableway Hanger Extensions

NOTES:

1. Purpose: This method is applicable to the extension of previously installed trapeze type cableway hangers with width of 6 to 17 inches. This method is intended to be used during ship overhauls when cables need to be added or during ship construction when scheduling or construction limitations preclude installation of replacement hangers.
2. Where bolting is impractical, extensions may be welded in place. Welding shall meet the requirements of 5.7.3.6.
3. The outside corner of the existing hanger may require grinding to accept extension. The exposed metal surfaces shall be primed and painted.
4. The total number of tiers and the cable weight of the original hanger and extension, combined, shall not exceed the limits of 5.7.3.1.
5. If the existing hanger does not have pre-drilled holes, use the extension as a template and drill  $\frac{7}{16}$  inch diameter clear holes for bolting.
6. This method shall not be used for previously extended hangers.
7. See 5.7.3.7 for fastener and fastener material requirements.
8. Hanger extensions shall be of the same material as the original hanger.

TABLE 4B20-I. List of material for trapeze cableway hanger extensions.

Item	Description
1	Angle downcomer extension
2	Cross tier, 12-gauge steel
3	Hex head capscrew, $\frac{3}{8}$ -16UNC – length to suit
4	Self-locking nut, $\frac{3}{8}$ -16UNC
5	Hex head cap screw, $\frac{3}{8}$ -16UNC - length $\frac{3}{4}$

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-20-3  
Trapeze Cableway Hanger Tier Extension

General Notes:

1. This method is applicable to the modification of method 4B-20-1 trapeze cableway hangers using [figure 4B21](#) cableway hanger tiers. This method allows tiers to be installed such that they extend past the downcomer to gain additional cableway volume without widening the hanger points of attachment.
2. Only hangers installed in accordance with method 4B-20-1 may utilize this method.
3. This method shall only be used in cableway hangers that have three or less tiers. Once this method has been used, the cableway hanger must remain at a maximum of three tiers.
4. Tier extensions may be installed in any configuration provided that the overhang from the edge of the downcomer to the end of the tier does not exceed eight inches.
5. See 5.7.3.7 for fastener and fastener material requirements.
6. Hanger extensions shall be of the same material as the original hanger.
7. See [figure 4B22](#) for an alternate tier bar design.

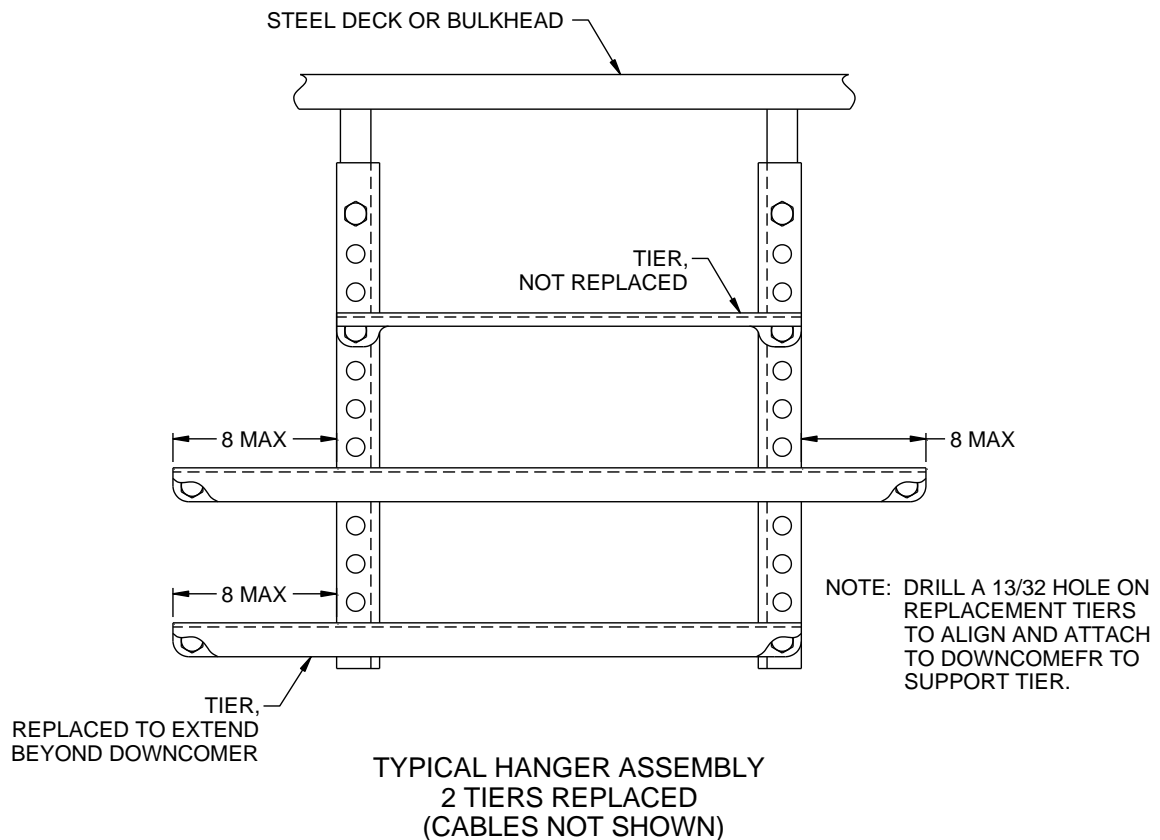

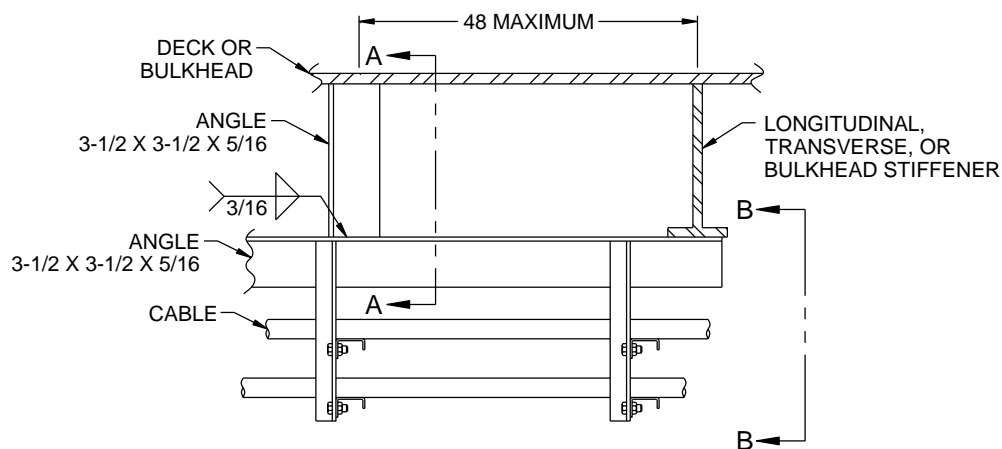

FIGURE 4B20. Multiple cableways on decks and bulkheads (surface ships) – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

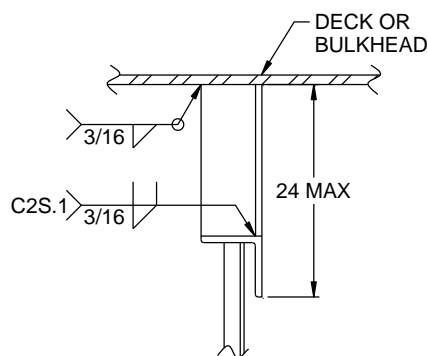

Method 4B-20-4  
Cableway on Running Angle

NOTES:

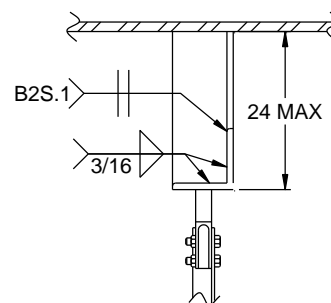

1. Purpose: This method is applicable to supporting method 4B-20-1 cable hangers from structural bulkheads and decks to clear various ship system interferences in way of routing of hangers.
2. See 5.7.3.7 for fastener and fastener material requirements.
3. See 5.7.3.6 for welding requirements.

Method 4B-20-5  
Bottom Loading of Cableway Tiers

NOTES:

1. Purpose: This method allows bottom loading of cableway tiers in congested areas.
2. This method shall be used with the cableway supports shown in method 4B-20-1.
3. Observe the maximum number of tiers and tier loading of 5.7.3.1.
4. Cableway tiers shall be banded with retention devices in accordance with 5.7.3.4.
5. See 5.7.3.7 for fastener and fastener material requirements.

Method 4B-20-6  
Overhead Trapeze Hangers, One Leg Suspended by a Beam

NOTES:

1. Purpose: The purpose of this method is to provide installation instructions for an overhead trapeze hanger where one leg is supported by a ship structural beam.
2. A maximum of three tiers may be used for this cable hanger.
3. Orientation restriction: parallel to the ship fore/aft axis.
4. Hanger spacing requirements shall be in accordance with 5.7.3.1.
5. Cable retention in accordance with 5.7.3.4.
6. See 5.7.3.7 for fastener and fastener material requirements.
7. See [figure 4B22](#) for an alternate tier bar design.
8. See 5.7.3.8 for collar and welding stud requirements.

APPENDIX 4B

Method 4B-20-7  
Eight Tier Overhead Trapeze Hanger – Steel

NOTES:

1. Number of hanger tiers is limited to eight. Since this hanger includes eight tiers, in accordance with 5.7.3.1.c, NAVSEA approval is required to use this method.
2. Hanger orientation is unrestricted.
3. Maximum spacing shall be in accordance with 5.7.3.1.
4. Weld directly to structure.
5. Limited to attachment to overhead.
6. Cable retention in accordance with 5.7.3.4.
7. See 5.7.3.7 for fastener and fastener material requirements.
8. See [figure 4B22](#) for an alternate tier bar design.
9. See 5.7.3.6 for welding requirements.

APPENDIX 4B

Method 4B-20-8  
Five Tier Overhead Trapeze Hanger – Aluminum

NOTES:

1. This method includes instructions for installing a five tier aluminum overhead cableway hanger welded directly to the overhead. Since this hanger includes five tiers, in accordance with 5.7.3.1.b, NAVSEA approval is required to use this method.
2. A maximum of five tiers are allowed for this hanger installation.
3. Cable orientation is unrestricted.
4. A bottom cross-tier is required; see illustration below.
5. The maximum hanger spacing shall be in accordance with 5.7.3.1.
6. Weld directly to plating in the overhead.
7. Cable retention in accordance with 5.7.3.4.
8. See 5.7.3.7 for fastener and fastener material requirements.
9. See 5.7.3.6 for welding requirements.

APPENDIX 4B

NOTE:

1. This figure provides cable support details for degaussing cables. Methods shown may be used for general installation where applicable.
  - a. When insulation is used with degaussing cables, use corresponding insulation methods for cable hanger methods listed.
  - b. Use appropriate ballistic methods for degaussing cable installation as required.
  - c. Where light-tightness is required, cables passing through non-watertight bulkheads shall be run through individual liner sleeves and then carefully packed with plastic sealer in accordance with MIL-I-3064, type HF.
  - d. Conduit shall be graded at  $\frac{1}{8}$  inch per foot minimum.
  - e. Cable conduit shall be of copper-nickel pipe.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

METHOD 4B-94-1  
SINGLE TIER OF CABLES  
SUPPORTED AWAY FROM WOOD DECKS  
(SEE NOTES)

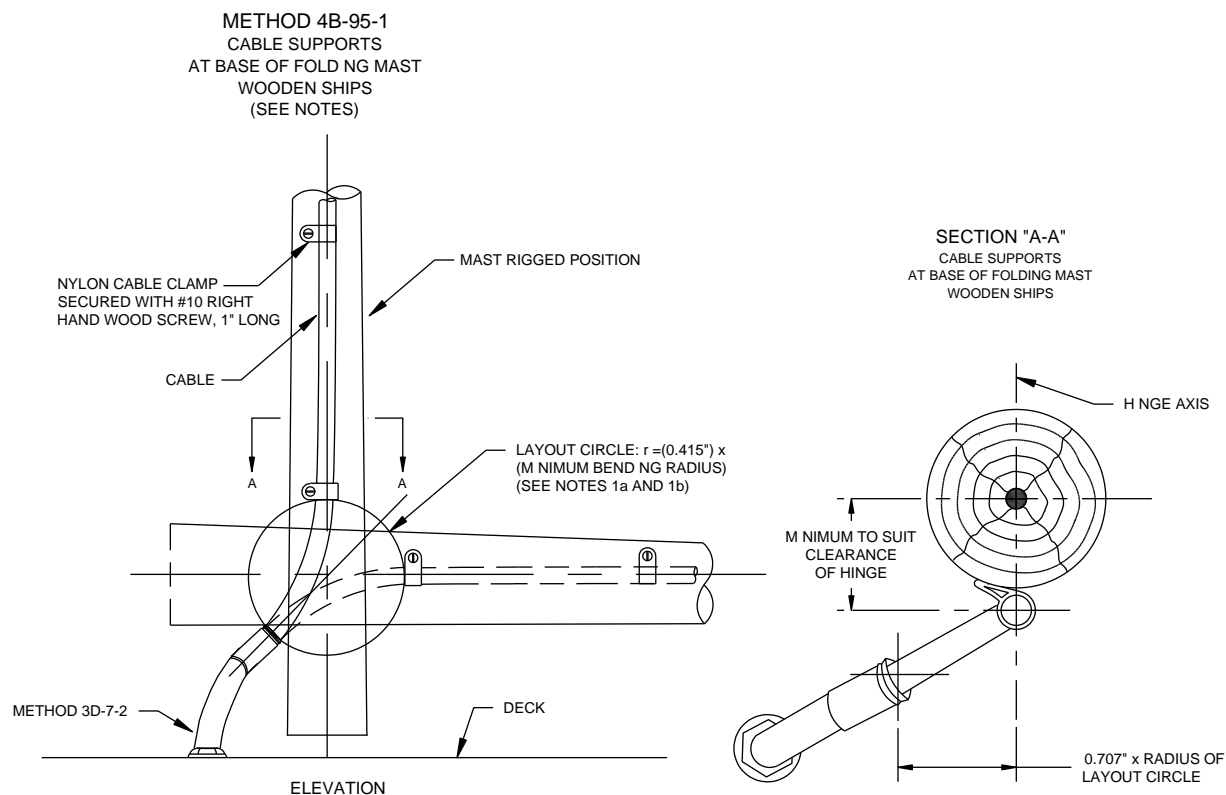

NOTES:

1. For non-magnetic application, see 5.7.3.2.
2. For cables greater than 2 inches in diameter, use methods shown on figures [4B91](#) through [4B94](#).
3. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4B94. Supporting a single row of cables to avoid an obstruction or preserve alignment of cable runs on wooden decks.  
(Guidance only)

MIL-STD-2003-4B(SH)  
APPENDIX 4B

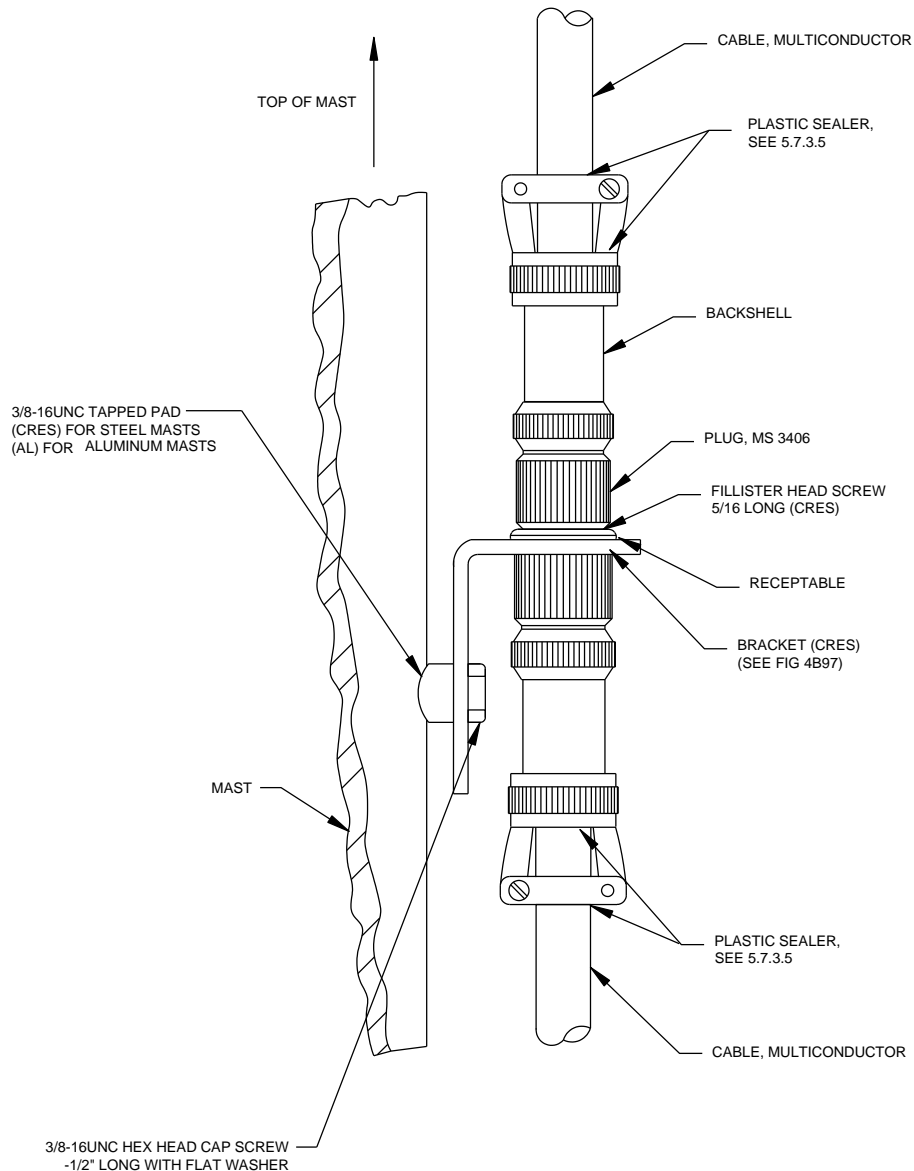

NOTES:

1. For folding masts on wooden ships:
  - a. The dimension used for "r" shall not be less than 4 inches.
  - b. Where more than one cable is involved, "r" shall be determined by using the bending radius of the largest cable.
  - c. Cable shall be firmly fastened with mast in 45° position to ensure proper length for flexing.
2. See 5.7.3.7 for fastener and fastener material requirements.
3. Method 3D-7-2, "For Passing Single Cables Through W.T. Wood Decks", is from MIL-STD-2003-3.

FIGURE 4B95. Cableways on folding masts (surface ships).

## MIL-STD-2003-4B(SH)

## APPENDIX 4B

METHOD 4B-96-1  
COUPLING OF MULTIPLE CABLES  
(CONNECTORS PER MIL-STD-2003-5)

## NOTES:

1. Water intrusion into connectors that are installed topside poses a significant problem. Installers shall take additional precautions to protect these connectors. Various options are available. MIL-STD-2003-1 includes methods for weatherproofing of topside electrical connectors. Local approved methods may also be used. If a local method or a method from MIL-STD-2003-1 is not selected, the following is recommended: The connector shall be wrapped with a suitable electrical tape using a one half lap wrap followed with an application of heat shrink tubing in accordance with SAE-AS23053/5 or SAE-AS23053/15. This procedure shall be accomplished on each portion of the connector above and below the bracket. The tape shall extend 3 inches beyond the cable clamps and the heat shrink tubing shall extend 4 inches beyond the cable clamps.
2. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4B96. Cableways on masts with connectors (surface ships).

Method 4B-101-1  
Y-Hangers for Cableway Support and Routing (3-Way/3 Tier) (Surface Ships)

NOTES:

1. Adhere to the figure below.
2. Y-hangers shall be used only for horizontal cable runs.
3. Y-hangers shall only be used in surface ships and shall not be used in aircraft carrier spaces under the cognizance of NAVSEA 08.
4. Y-hangers shall be used only at intersections of cable runs. Cable hangers in straight runs shall be in accordance with the other methods in this standard.
5. The maximum number of tiers that may be used with the Y-hangers is three.
6. Flatbar separators shall be installed between the tiers.
7. Edges shall be rounded to avoid chafing.
8. Material may be steel or aluminum.
9. Welding shall be in accordance with 5.7.3.6.

Method 4B-103-1  
Trapeze Type Cableways, Stud Weld Attachment - Steel

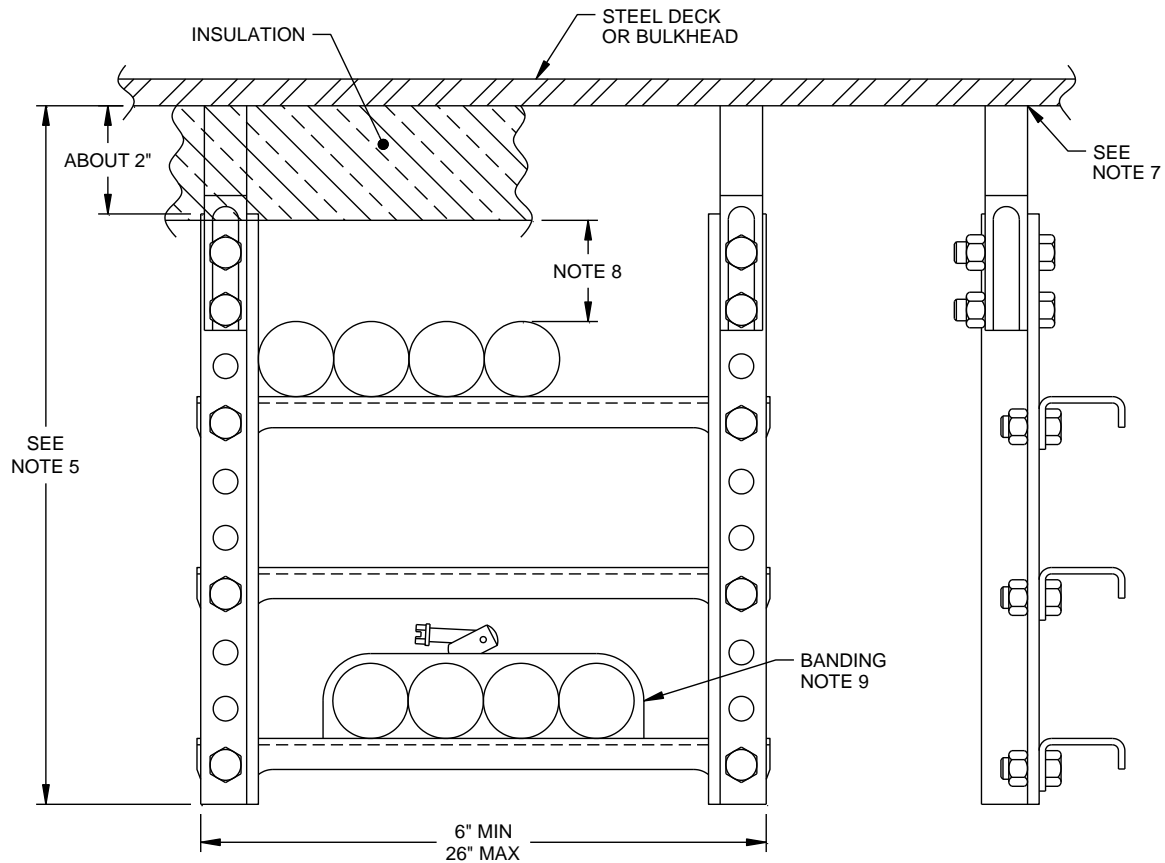

Illustration 1 – Typical Hanger Assembly

NOTES:

1. This method is applicable to mounting single or multiple cable tiers from structural steel decks and bulkheads.
2. Downcomers may be angle steel or channel steel. For demonstration purposes, only angle bar downcomer is shown in these illustrations. See figures [4B21](#) and [4B24](#) for typical dimensions and details of downcomers.
3. Cross tiers may be tier bars as shown on figures [4B21](#), [4B22](#), [4B24](#), or [4B25](#) or tubular hangers as shown on figures [4C58](#), [4C59](#), or [4C60](#). For demonstration purposes, only tier bars are shown here.
4. The maximum cable weight shall not exceed 96 pounds per tier. For a five tier assembly, the maximum weight shall not exceed 480 pounds. The number of tiers shall not exceed the following:
  - a. Maximum of five tiers from deck, for hanger spans between 6 inches and 17 inches.
  - b. Maximum of three tiers from deck, for hanger spans between 17 inches and 26 inches.
  - c. Maximum of two tiers from bulkhead, for hanger spans between 6 inches and 17 inches.
  - d. Maximum of one tier from bulkhead, for hanger spans between 17 inches and 26 inches.
  - e. Maximum of three to five tiers from bulkhead with flat bar supports (see illustration 2).

FIGURE 4B103. Multiple cableways on steel decks and bulkheads (surface ships).

MIL-STD-2003-4B(SH)  
APPENDIX 4B

NOTES (continued):

5. The maximum lengths of the cable hangers shall not exceed the following:
  - a. Steel angle downcomer from deck: 38 inches.
  - b. Steel channel downcomer from deck: 65 inches.
  - c. Steel angle downcomer from bulkhead: 20 inches.
  - d. Steel channel downcomer from bulkhead: 36 inches.
6. The maximum center-to-center hanger spacing shall not exceed the limits in 5.7.3.1.
7. The attachment method shall be in accordance with illustrations 2 and 3. See weld note 3 after illustration 3 for attaching to plating less than  $\frac{1}{4}$  inch thick.
8. A minimum clearance of  $\frac{1}{2}$  inch shall be maintained from the largest cable to adjacent structure, tier, or insulation.
9. Cable banding shall be in accordance with Appendix 4C.
10. Weld studs shall be steel. See 5.7.3.8.
11. See 5.7.3.7 for fastener and fastener material requirements. The orientation of the fastener connection between the weld stud and downcomer should be as shown in illustration 1 to maximize the shear strength of the connection.

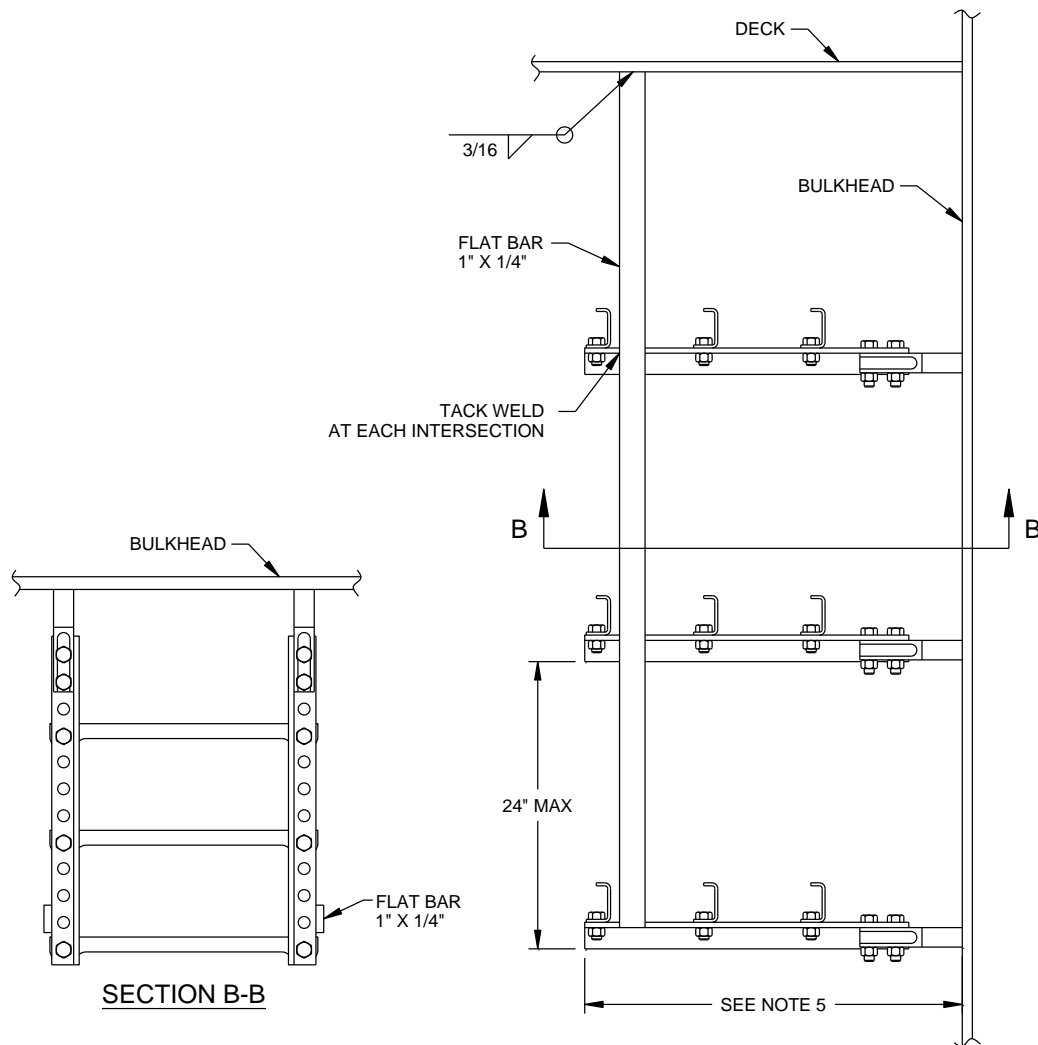

Illustration 2 – Additional Support for Bulkhead Attached Cableway

FIGURE 4B103. Multiple cableways on steel decks and bulkheads (surface ships) – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

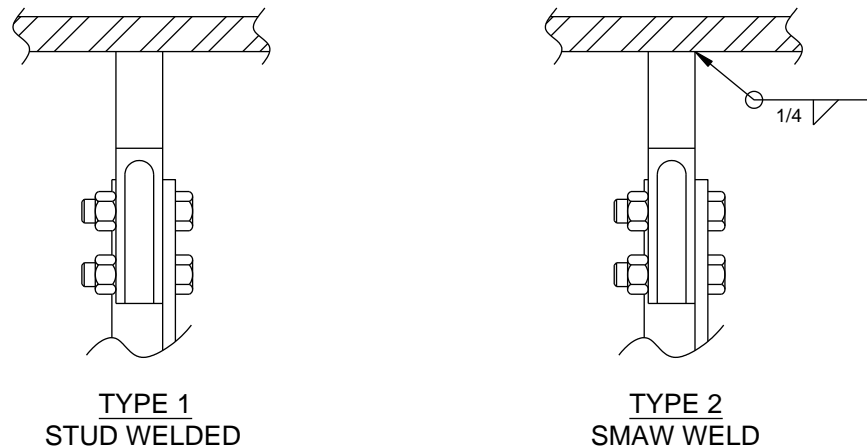

Illustration 3 – Rounded Corner Welded Stud Attachment

WELD NOTES:

1. All welding shall be in accordance with 5.7.3.6.
2. Type 1 is the preferred attachment method using  $\frac{3}{4}$  inch round/square studs.
3. Use type 2 (SMAW) weld attachment method for plating less than  $\frac{1}{4}$  inch thick. Type 2 attachments may also be used when stud welding is not practical. When SMAW welding, the flux ball at the base of the stud shall be completely removed.

FIGURE 4B103. Multiple cableways on steel decks and bulkheads (surface ships) – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-103-2  
Inverted "T" Type Cableway hangers, Stud Weld Attachment - Steel

NOTES:

1. This method is for installation of stud welded inverted "T" hangers for main cableways.
2. A maximum of three tiers may be used for this cable hanger.
3. Maximum hanger spacing shall not exceed the limits in 5.7.3.1.
4. The orientation for this hanger is restricted to parallel to the ship fore and aft axis.
5. See 5.7.3.6 for welding requirements.
6. See 5.7.3.4 for cable retention requirements.
7. Cable orientation restricted to the ship fore/aft axis.
8. See 5.7.3.7 for fastener and fastener material requirements.
9. See 5.7.3.8 for collar and welding stud requirements.

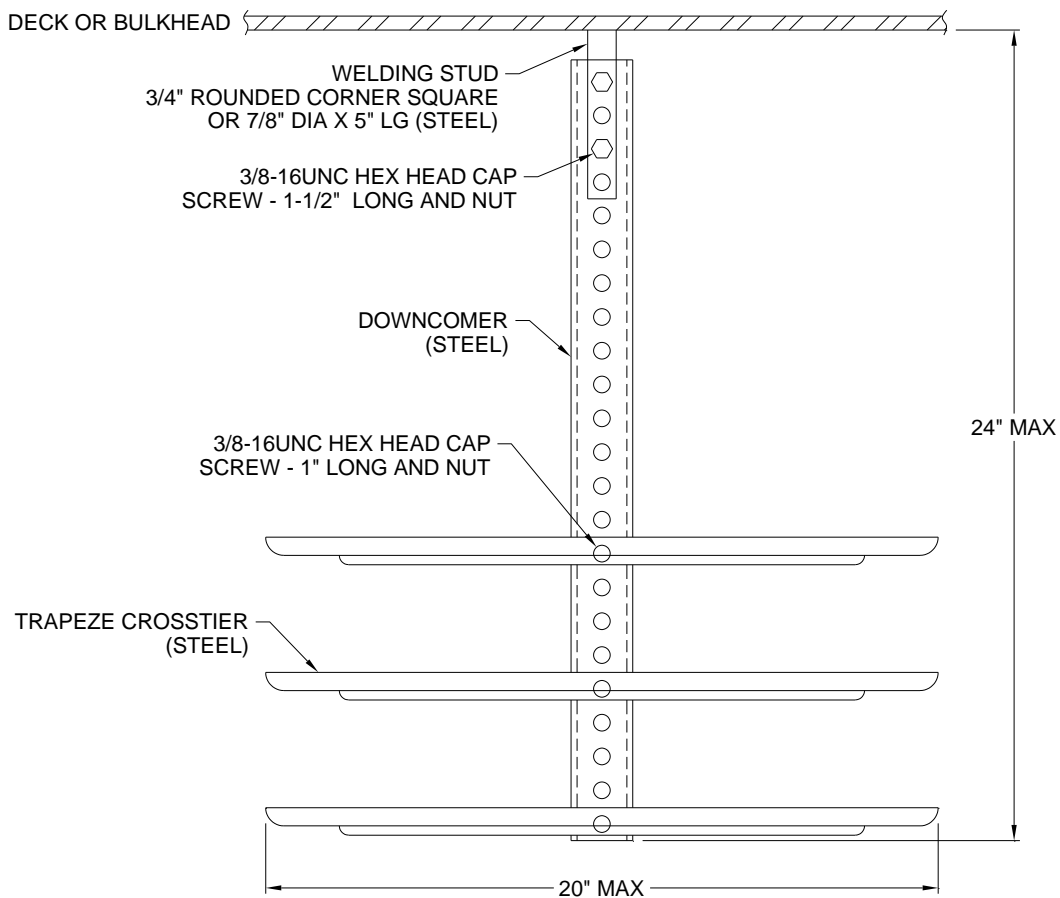

FIGURE 4B103. Multiple cableways on steel decks and bulkheads (surface ships) – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-103-3  
Trapeze Type Cable Hangers, Stud Weld Attachment, Square Tube Cross-Tiers – Steel

NOTES:

1. The number of tiers shall not exceed three.
2. Cable orientation shall be perpendicular to the ship fore/aft axis.
3. Hanger spacing shall not exceed the limits in 5.7.3.1.
4. See 5.7.3.7 for fastener and fastener material requirements.
5. See 5.7.3.8 for collar and welding stud requirements.

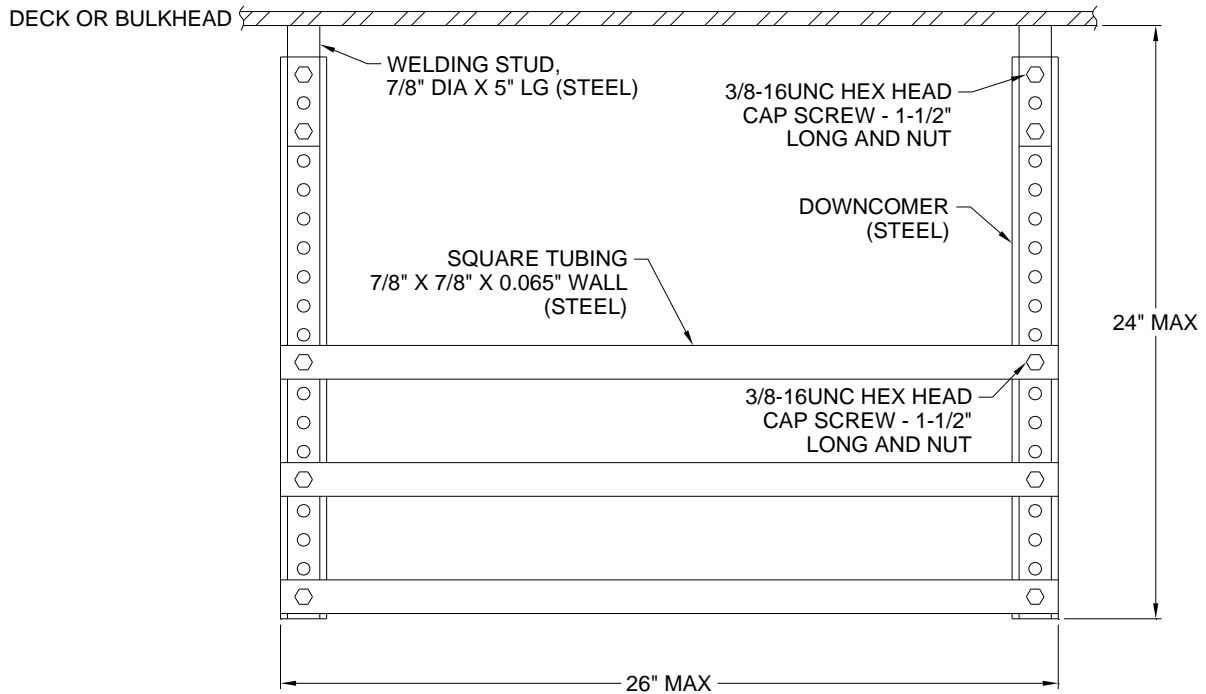

FIGURE 4B103. Multiple cableways on steel decks and bulkheads (surface ships) – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-104-1  
Shotgun Hanger Mounted with Aluminum Stud

NOTES:

1. Purpose: The purpose of this method is to provide requirements for installation of shotgun hangers mounted with an aluminum welding stud.
2. Maximum loading on hanger: 40 pounds.
3. Orientation restriction: none.
4. Hanger spacing: Shall not exceed the limits in 5.7.3.1.
5. Cross tier length:  $7\frac{3}{4}$  inches.
6. Downcomer:  $\frac{3}{4}$  inch x 3 inches aluminum stud.
7. Downcomer attachment method: stud weld (see 5.7.3.6).
8. Cable banding: see 5.7.3.4.
9. Cable diameter: limited to 1.5 inches maximum.
10. See 5.7.3.8 for collar and welding stud requirements.
11. See 5.7.3.7 for fastener and fastener material requirements.

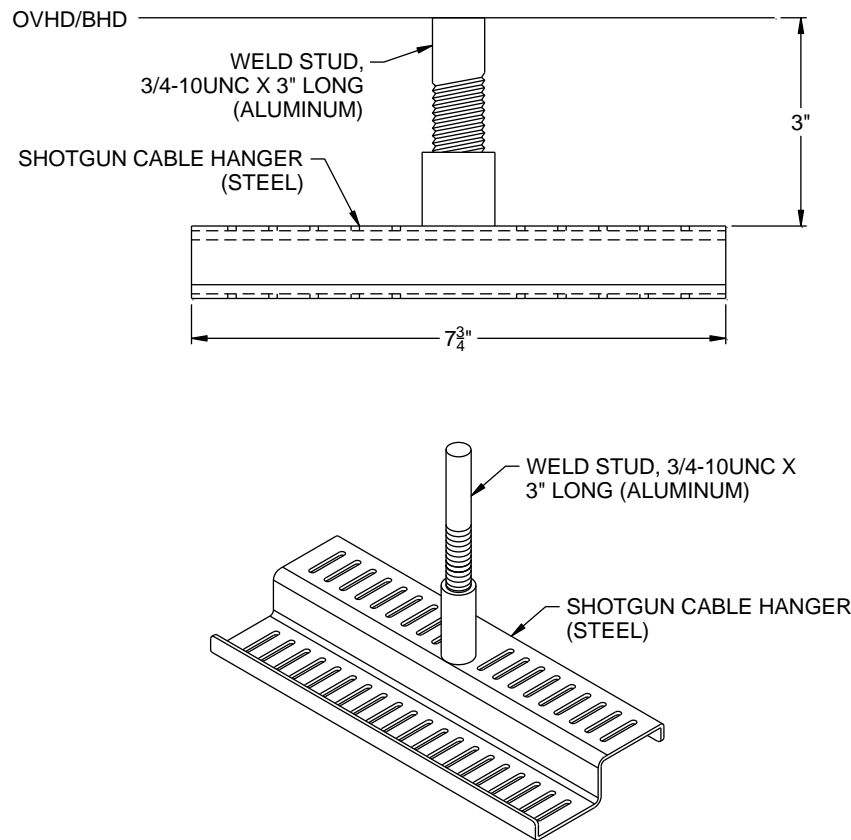

FIGURE 4B104. Shotgun hangers.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-104-2  
Shotgun Hanger Mounted with Steel Stud

NOTES:

1. Purpose: The purpose of this method is to provide requirements for installation of shotgun hangers mounted with a steel welding stud.
2. Maximum loading on hanger: 20 pounds.
3. Orientation restriction: none.
4. Hanger spacing: Shall not exceed the limits in 5.7.3.1.
5. Cross tier length:  $7\frac{3}{4}$  inches.
6. Downcomer:  $\frac{3}{8}$  inch x 6 inches steel stud.
7. Downcomer attachment method: stud weld (see 5.7.3.6).
8. Cable banding: see 5.7.3.4.
9. Cable diameter: limited to 1.5 inches maximum.
10. See 5.7.3.8 for collar and welding stud requirements.
11. See 5.7.3.7 for fastener and fastener material requirements.

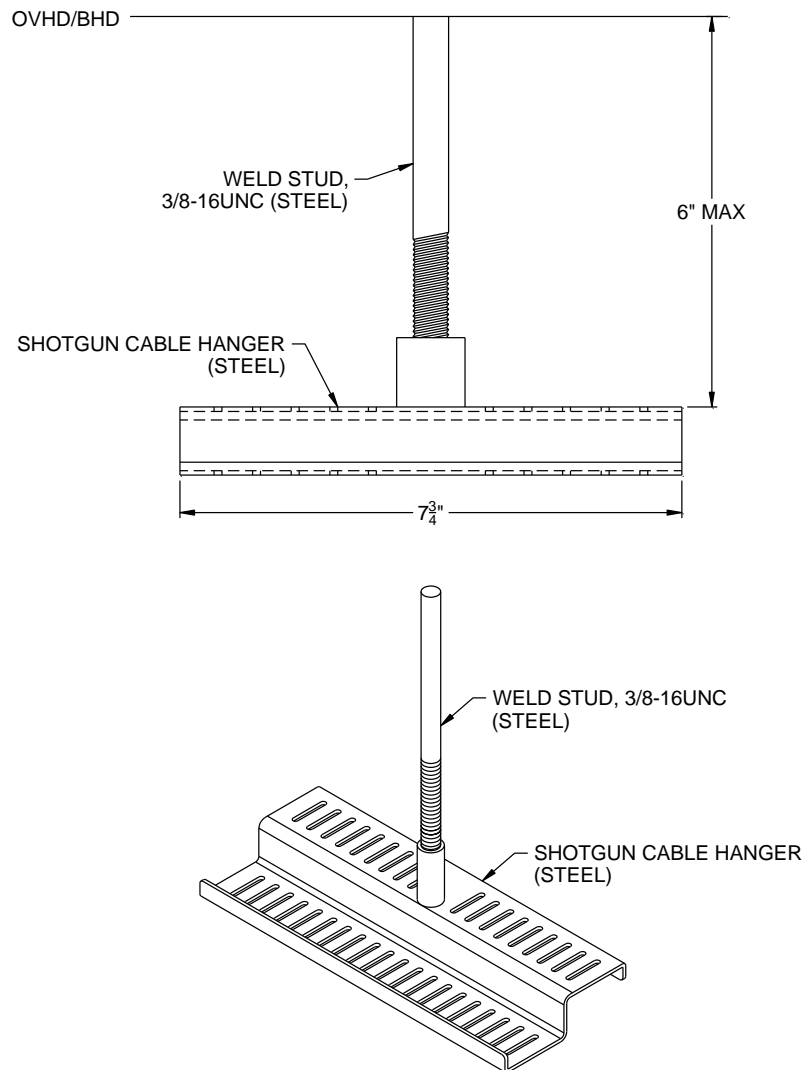

FIGURE 4B104. Shotgun hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

General Notes:

1. Purpose: The purpose of these methods is to provide installation instructions for trapeze hangers to be installed beneath false decks.
2. A maximum of three tiers may be used for these cable hangers.

Method 4B-105-1  
False Deck Trapeze Hanger Using Weld Studs – Steel

NOTES:

1. See general notes at the beginning of this figure.
2. Orientation: Cable orientation is restricted to parallel to the ship fore and aft axis.
3. Typical spacing above the top tier should be at least 2 inches. 1-inch spacing is acceptable.
4. Typical spacing between tiers is 4 inches. Non-standard spacing may be used.
5. Hanger spacing shall not exceed the limits in 5.7.3.1.
6. See 5.7.3.7 for fastener and fastener material requirements.
7. See 5.7.3.8 for collar and welding stud requirements.

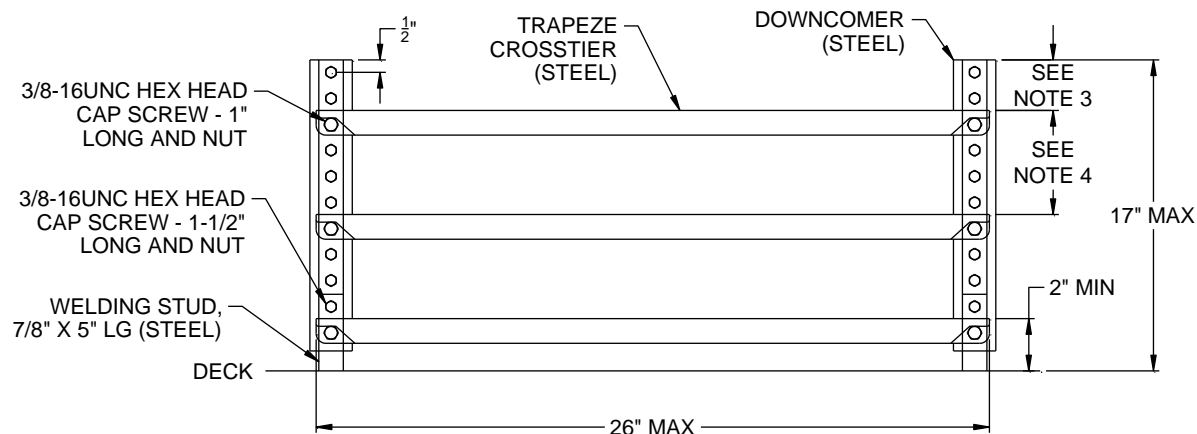

Illustration – Steel below deck trapeze hanger using weld studs.

FIGURE 4B105. Installation of false deck trapeze hangers.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-105-2  
False Deck Trapeze Hanger, Direct Weld to Deck – Steel

NOTES:

1. See general notes at the beginning of this figure.
2. Maximum load per cross tier: 144 pounds.
3. Maximum load per hanger: 432 pounds.
4. Typical spacing above the top tier should be at least 2 inches. 1-inch spacing is acceptable.
5. Typical spacing between tiers is 4 inches. Non-standard spacing may be used.
6. Unrestricted hanger orientation.
7. See 5.7.3.6 for welding requirements. Weld directly to plating.
8. Hanger spacing shall not exceed the limits in 5.7.3.1.
9. See 5.7.3.7 for fastener and fastener material requirements.

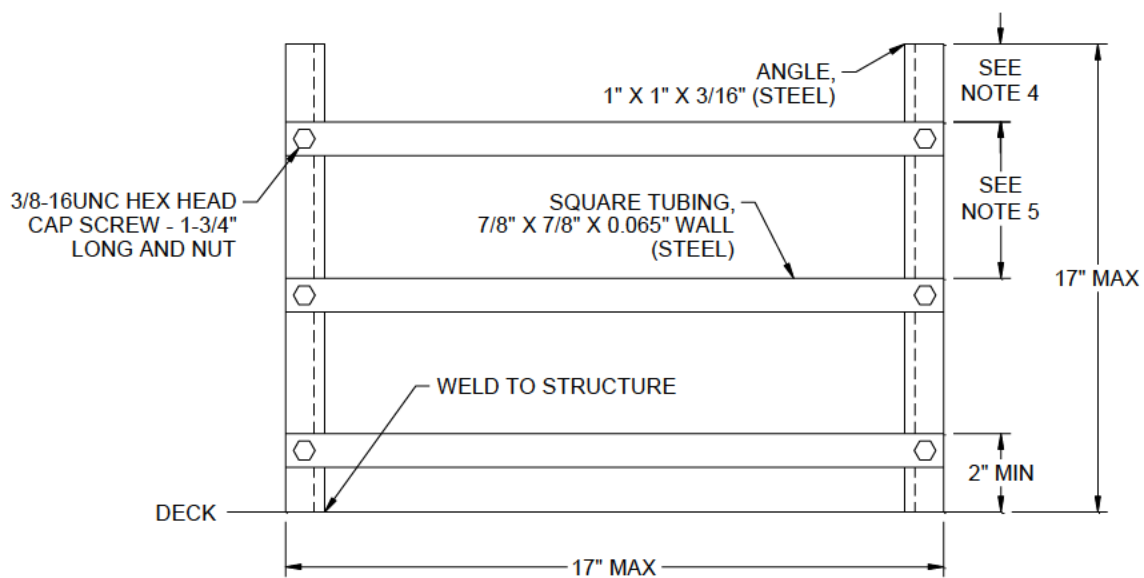

Illustration – False deck trapeze hanger, direct weld to deck – steel

FIGURE 4B105. Installation of false deck trapeze hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-105-3  
False Deck Trapeze Hanger, Direct Weld to Deck – Aluminum

NOTES:

1. See general notes at the beginning of this figure.
2. Maximum load per cross tier: 111 pounds.
3. Maximum load per hanger: 333 pounds.
4. Typical spacing above the top tier should be at least 2 inches. 1-inch spacing is acceptable.
5. Typical spacing between tiers is 4 inches. Non-standard spacing may be used.
6. Unrestricted hanger orientation.
7. See 5.7.3.6 for welding requirements. Weld directly to plating.
8. ~~Hanger spacing shall not exceed the limits in 5.7.3.1.~~
9. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4B105. Installation of false deck trapeze hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-105-4  
False Deck Trapeze Hanger, Direct Weld to Deck – Aluminum

NOTES:

1. See general notes at the beginning of this figure.
2. Maximum load per cross tier: 111 pounds.
3. Maximum load per hanger: 333 pounds.
4. Typical spacing above the top tier should be at least 2 inches. 1-inch spacing is acceptable.
5. Typical spacing between tiers is 4 inches. Non-standard spacing may be used.
6. Unrestricted hanger orientation.
7. See 5.7.3.6 for welding requirements. Weld directly to plating.
8. ~~Hanger spacing shall not exceed the limits of 5.7.3.1.~~
9. See 5.7.3.7 for fastener and fastener material requirements.

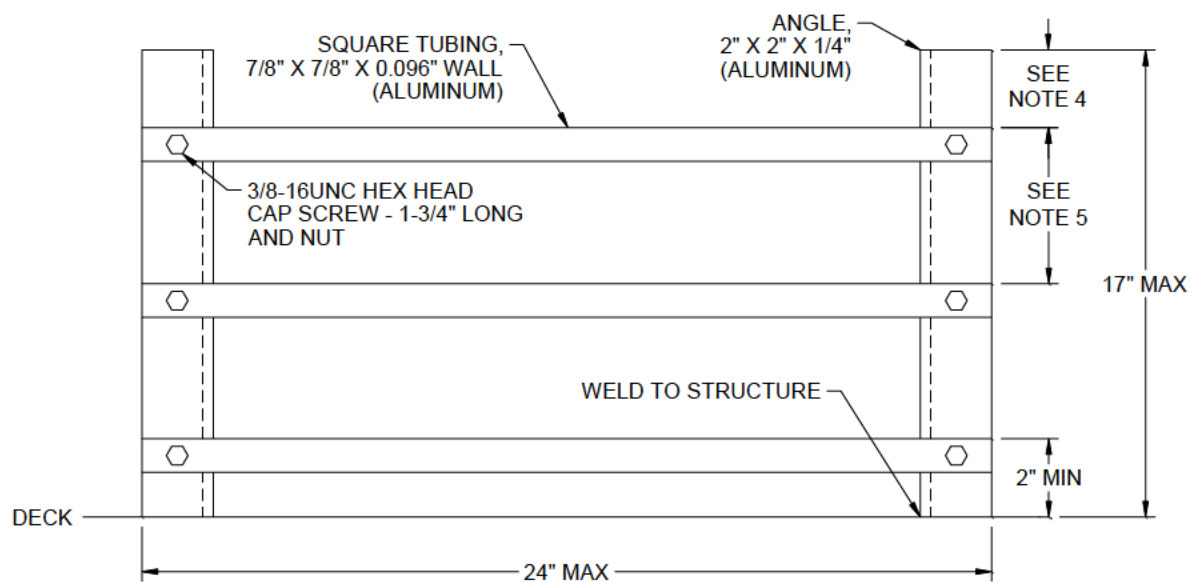

Illustration – False deck trapeze hanger, direct weld to deck – aluminum

FIGURE 4B105. Installation of false deck trapeze hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

General Notes:

1. The purpose of this figure is to provide methods for installation of bulkhead and overhead "L" hangers.
2. A maximum of one cable tier is allowed for these cable hangers.
3. Orientation: Unrestricted.
4. Cable retention and banding: See 5.7.3.4.
5. Welding shall be in accordance with 5.7.3.6.

Method 4B-106-1  
Aluminum Bulkhead "L" Hangers

NOTES:

1. Spacing: Shall not exceed the limits of 5.7.3.1.
2. See 5.7.3.6 for welding requirements.

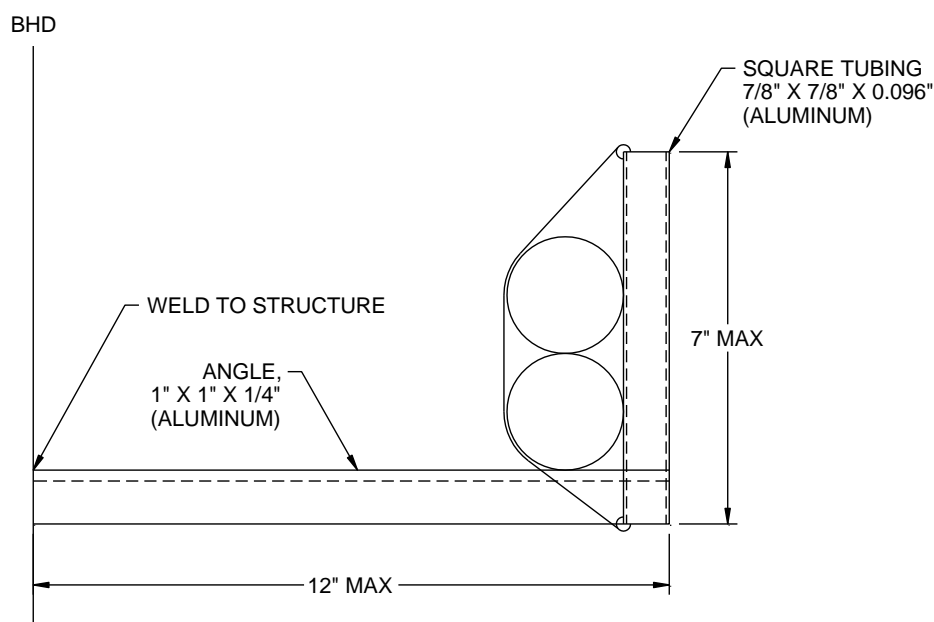

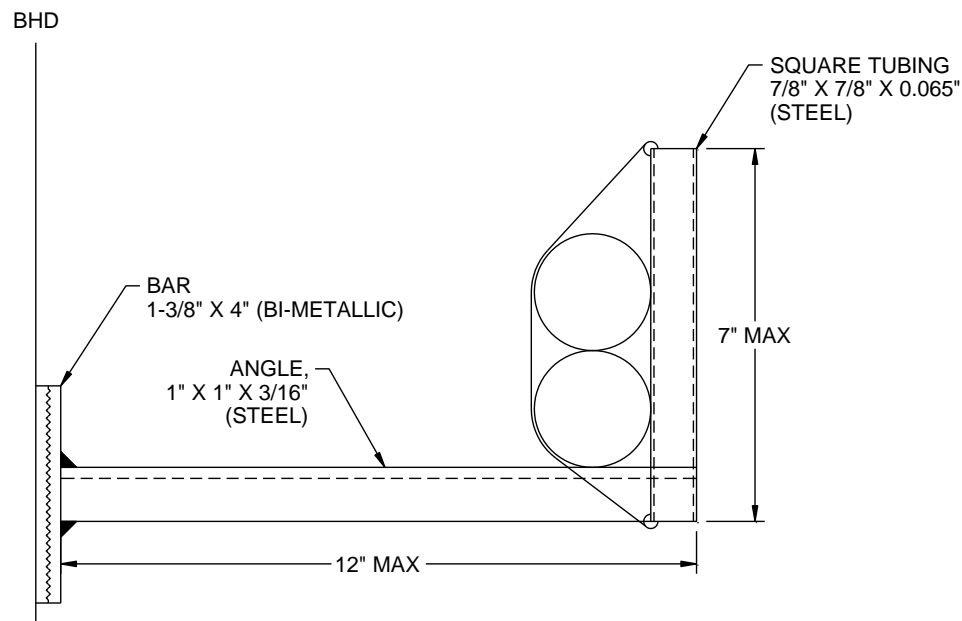

FIGURE 4B106. Bulkhead and overhead "L" hangers.

MIL-STD-2003-4B(SH)  
APPENDIX 4BMethod 4B-106-2  
Steel Bulkhead "L" Hangers Attached to Aluminum Bulkheads

## NOTES:

1. This method is for attaching a steel hanger to an aluminum bulkhead.
2. Adhere to 5.7.3.1 requirements for interspersing steel hangers with aluminum hangers for cableways attached to aluminum bulkheads or decks.
3. Spacing, as required by 5.7.3.1.
4. See 5.7.3.6 for welding requirements.
5. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4B106. Bulkhead and overhead "L" hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-106-3  
Steel Bulkhead "L" Hangers

NOTES:

1. Weld directly to bulkhead.
2. Maximum spacing shall not exceed the limits of 5.7.3.1.

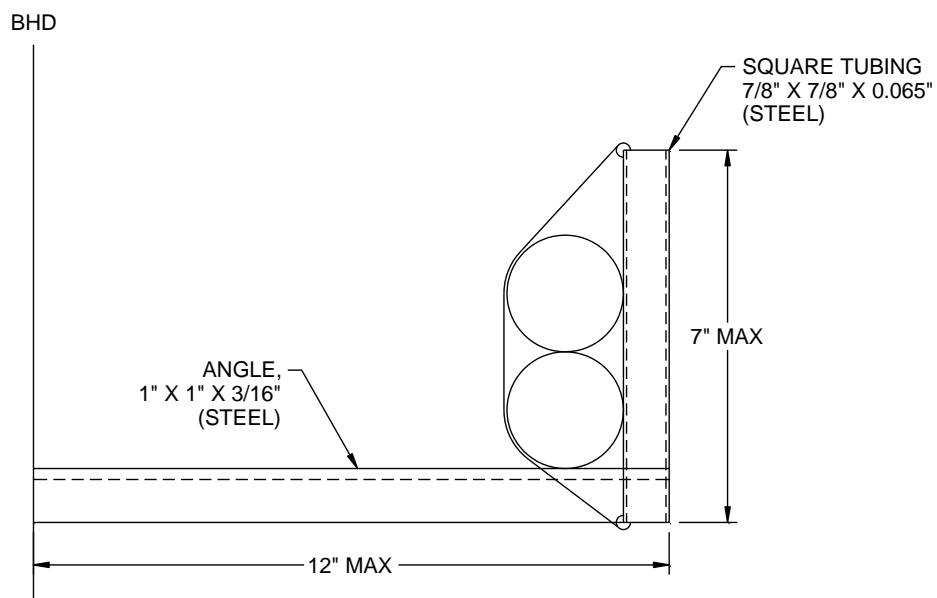

FIGURE 4B106. Bulkhead and overhead "L" hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-106-4  
Aluminum Overhead "L" Hangers

NOTE:

1. Maximum spacing shall not exceed the limits of 5.7.3.1.

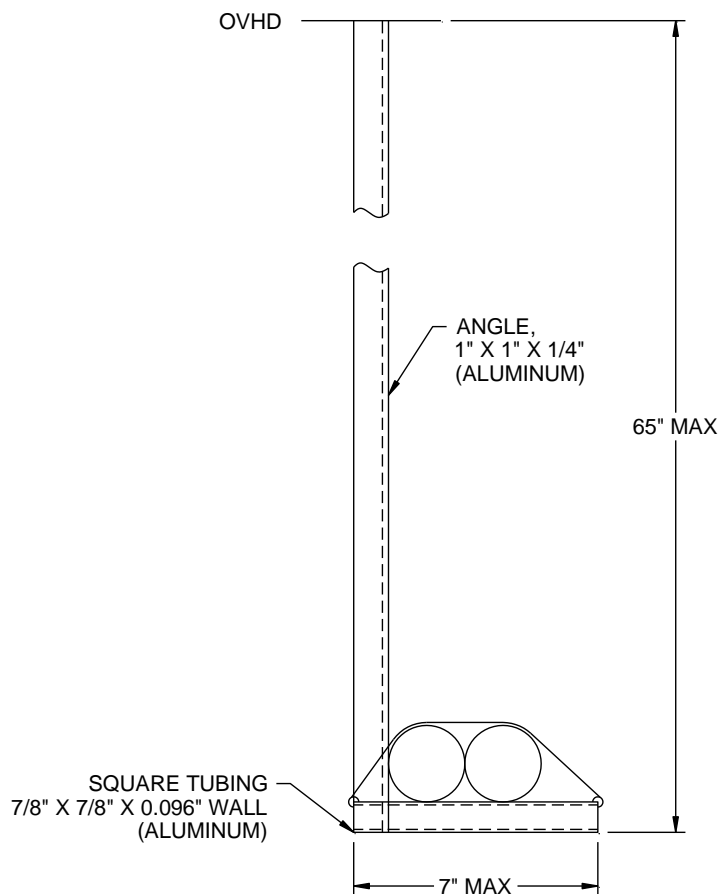

FIGURE 4B106. Bulkhead and overhead "L" hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-106-5  
Steel Overhead "L" Hangers Attached to Aluminum Overheads

NOTES:

1. This method is for attaching a steel hanger to an aluminum overhead.
2. Adhere to 5.7.3.1 requirements for interspersing steel hangers with aluminum hangers for cableways attached to aluminum bulkheads or decks.
3. Spacing, as required by 5.7.3.1.
4. See 5.7.3.7 for fastener and fastener material requirements.

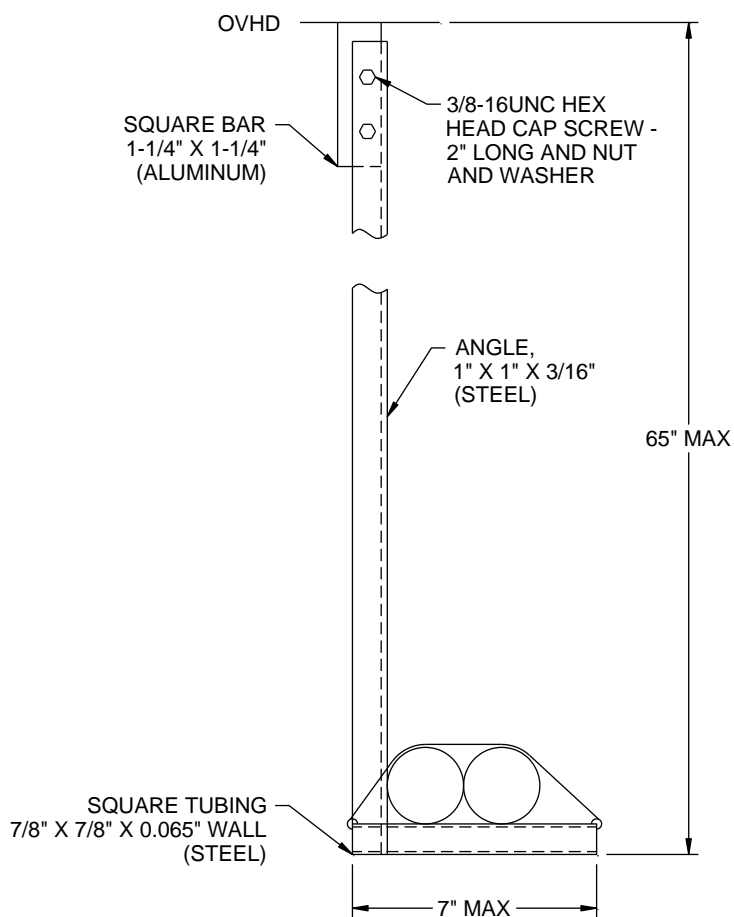

FIGURE 4B106. Bulkhead and overhead "L" hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

Method 4B-106-6  
Steel Overhead "L" Hangers

NOTE:

1. Maximum spacing shall not exceed the limits of 5.7.3.1.

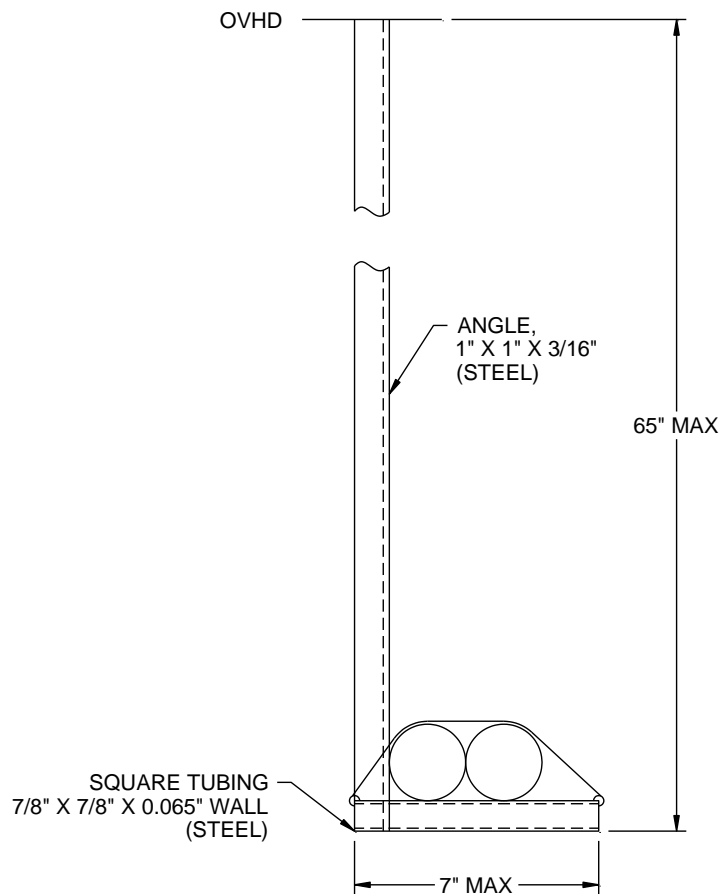

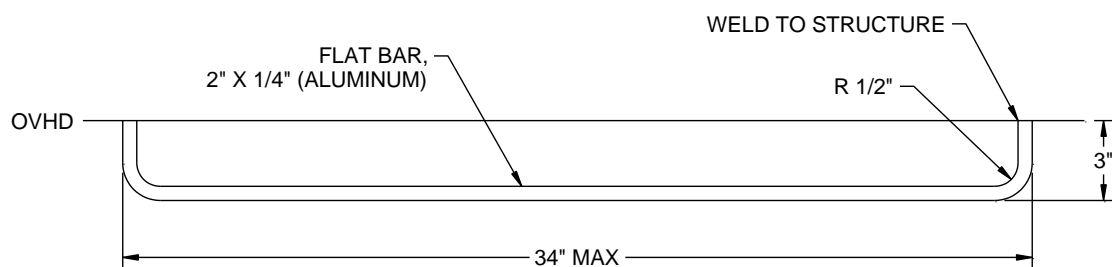

FIGURE 4B106. Bulkhead and overhead "L" hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4B

## NOTES:

1. One tier of cables maximum.
2. Unrestricted orientation.
3. Weld directly to overhead (see 5.7.3.6).

FIGURE 4B107. U-Bar hangers attached to overhead.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

APPENDIX 4C – CABLEWAYS (GENERAL)

C.1 SCOPE

C.1.1 Scope. This appendix describes general procedures for the installation of cableways on surface ships and submarines. This appendix is a mandatory part of the standard. The information contained herein is intended for compliance.

C.2. APPLICABLE DOCUMENTS

C.2.1 General. The documents listed in this section are specified in this appendix. This section does not include documents cited in other sections of this standard or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in this appendix, whether or not they are listed.

C.2.2 Government documents.

C.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-STD-2003-4B(SH)  
APPENDIX 4C

ASTM INTERNATIONAL

ASTM A240/A240M	-	Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
ASTM A276/A276M	-	Standard Specification for Stainless Steel Bars and Shapes
ASTM A568/A568M	-	Standard Specification for Steel, Sheet, Carbon, Structural, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for
ASTM A666	-	Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
ASTM A693	-	Standard Specification for Precipitation-Hardening Stainless and Heat-Resisting Steel Plate, Sheet, and Strip
ASTM A713	-	Standard Specification for Steel Wire, High-Carbon Spring, for Heat-Treated Components
ASTM B209	-	Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
ASTM B241/B241M	-	Standard Specification for Aluminum and Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube
ASTM B633	-	Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel
ASTM D3953	-	Standard Specification for Strapping, Flat Steel and Seals
ASTM F1836M	-	Standard Specification for Stuffing Tubes, Nylon, and Packing Assemblies (Metric)

(Copies of these documents are available online at [www.astm.org](http://www.astm.org).)

C.2.4 **Order of precedence.** Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

### C.3 REQUIRED EQUIPMENT AND MATERIALS

C.3.1 **Required equipment and materials.** The equipment and materials in the tables and referenced in the text of this appendix shall be used for the installation of cableways on surface ships and submarines. For fiber optic cable, refer to MIL-STD-2042-4. Refer to 5.7.3.7 for requirements regarding the use of mounting fasteners.

### C.4 NOTES AND PROCEDURES

C.4.1 **Dimensions.** For figures and tables in this appendix, all dimensions are in inches unless otherwise noted.

C.4.2 **Figures.** [Table 4CI](#) provides information for the figures in this appendix. Figures [4C2](#) through [4C12](#) and [4C35](#) are for local runs only.

C.4.4 Cable banding general requirements See [figures 4C52](#) through [4C56](#).

- a. Cables shall be arranged so that the larger cables are in the center of the hanger, if possible.
- b. The length of banding hanger shall not be less than the overall width of cables for a single cable or a row of cables.
- c. The minimum radius of bend shall be as specified in 5.2.
- d. For the application of banding material on [figures 4C52](#) through [4C56](#), band requirements are as follows:
  - (1) Single cables 1-inch diameter and under: 0.015 inch thick, one turn
  - (2) Single cables over 1-inch diameter: 0.015 inch thick, two turns
  - (3) Multiple cables 2-inch diameter and under: 0.015 inch thick, two turns
  - (4) Multiple cables over 2-inch diameter: 0.015 inch thick, three turns or 0.020 inch thick, two turns
- e. For fully loaded hangers (where hanger width does not exceed the width of a single cable or a single row of cables by more than ½ inch), use method 4C-55-2.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

- f. The banding method shall be used to support coaxial cables except coaxial cables of the semi-solid dielectric type. Semi-solid dielectric coaxial cables shall be supported by the contour strap methods such as those shown on figures [4C23](#), [4C24](#), and [4C25](#).
- g. For weather decks or highly corrosive areas, use CRES band, sizes and material in accordance with C.4.4.d and 5.7.3.2.1.
- h. In non-magnetic minesweepers, use CRES band except that an aluminum band (0.025 inch thick, see [table 4CVIII](#) for strapping material) may be used where cables are under 2 inches in diameter and hanger spacing is 21 inches on center, maximum.
- i. Material information for cable banding strapping is shown in [table 4CVIII](#) and 5.7.3.2.1.

TABLE 4CVIII. Material specification for banding strapping.

Material	Dimensions (inches)		Specifications	Finish
	Width	Thickness		
Mild steel	$\frac{5}{8}$	0.015	ASTM D3953, type 1, class B, grade 1	Zinc electro-plated
CRES	$\frac{5}{8}$	0.015	ASTM A240/A240M, ASTM A666, ASTM A693, ASTM A276/A276M	2D
Aluminum	$\frac{5}{8}$	0.025	ASTM B209	None
Mild steel	$\frac{5}{8}$	0.020	ASTM D3953, type 1, class B, grade 1	Zinc electro-plated
CRES	$\frac{5}{8}$	0.020	ASTM A240/A240M, ASTM A666, ASTM A693, ASTM A276/A276M	2D

- j. When installing and cutting banding material, follow the instructions of the manufacturer of the banding tool. Tools for cutting plastic and metal cable wraps as part of wrapping cables should be selected to prevent sharp edges that could result in personnel injury and damage to equipment and cables.
- k. Channel rubber shall be installed in accordance with [5.3.7](#). Information for channel rubber size, material, and specification is in [table 4CIX](#).

TABLE 4CIX. Material specification for rubber channel.

Material	Size (inches)			Specification
	Width	Channel	Height	
Rubber	$\frac{7}{8}$	$\frac{5}{8}$	$\frac{5}{16}$	MIL-PRF-6855, class 2, group 60

- l. Marine snaplock type cable clamps (hose-clamps), Ideal Clamp Products, Inc., or equal (see 4.3), may be used, with a maximum diameter as specified in [table 4CX](#). Ideal Clamp Products "56" series, or equal (see 4.3), cable retention devices of a length not greater than 22 inches are approved as an alternate to conventional banding materials. Dimensions for Ideal Clamp Products "56" series snaplock cable clamps are detailed in [table 4CX](#).

**WARNING:** Marine snaplock cable clamps are prohibited for use in reactor compartments.

**Justification:** Portsmouth Naval Shipyard Liaison Action Request (LAR) #PNS725-51 of 9/29/98 issued to request determination on use of "Marine Snaplock Cable Clamps" in reactor compartments. In response, Nuclear Liaison Inquiry #NLI-2535 issued by EB and approved by NAVSEA 08 prohibited their use in reactor compartments.

C.4.4.1 Panduit® Pan-Steel™, or equal (see 4.3), strapping. Panduit® Pan-Steel™, or equal (see 4.3), strapping is acceptable for use on surface ships and submarines subject to the following conditions:

- a. Cable straps shall be applied in conjunction with channel rubber.
- b. The maximum bundle diameter shall not exceed 3 inches. Panduit banding may be used for larger bundle diameters for non-weight bearing applications with specific NAVSEA approval.
- c. The maximum static weight of the cable bundle shall not exceed 6 pounds per Metal Locking Tie (MLT).
- d. In horizontal installations, the cable straps shall be no greater than 16 inches on-center apart. In vertical cable installations, the cable straps shall be no greater than 12 inches apart.
- e. For the installation of Panduit®, or equal (see 4.3), banding, use the appropriate tool as specified by the manufacturer.
- f. Part numbers, sizes, and stock numbers for Panduit® banding are detailed in [tables 4CXI](#) and [4CXII](#).

APPENDIX 4C

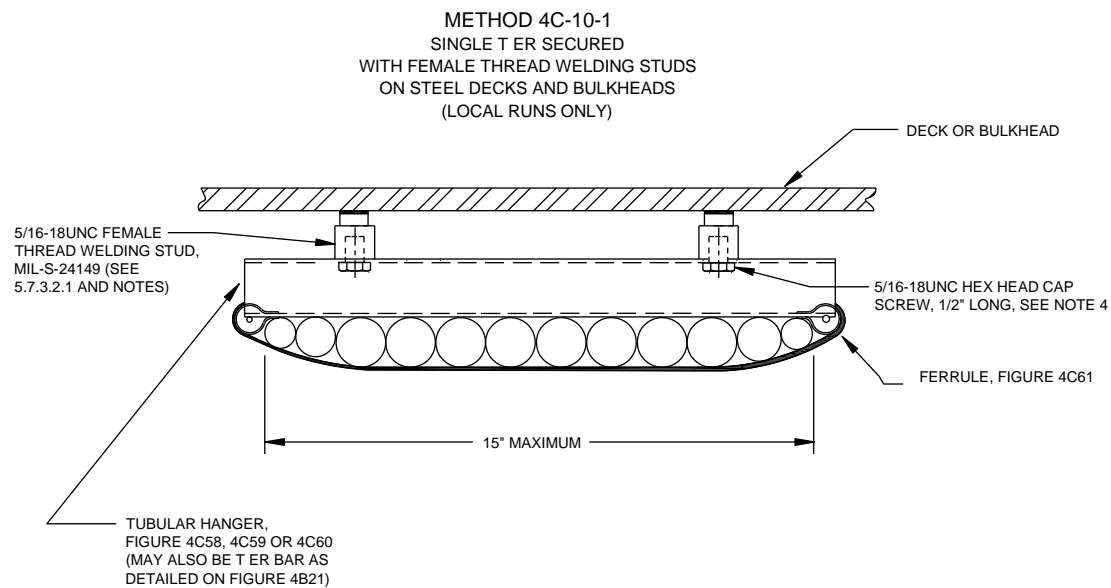

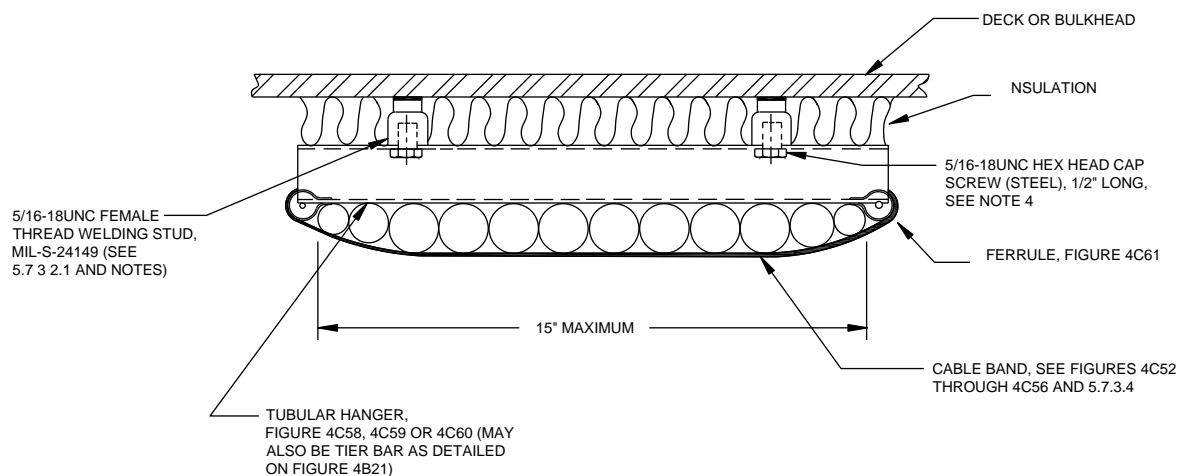

FIGURE 4C10. Single cableway on steel structure secured with female welding stud.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-11-1  
SINGLE TIER SECURED  
WITH FEMALE THREAD WELDING STUDS  
ON INSULATED DECKS AND BULKHEADS  
(LOCAL RUNS ONLY)

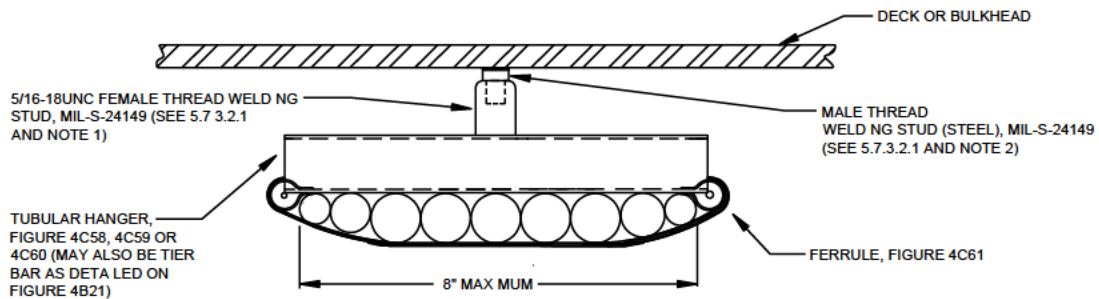

NOTES:

1. See C.4.3, tables [4CIII](#) and [4CIV](#), for internal thread welding stud material requirements.
2. See 5.7.3.8 for collar and welding stud requirements.
3. See 5.7.3.7 for fastener and fastener material requirements.
4. If a low profile is needed, use a button head screw.

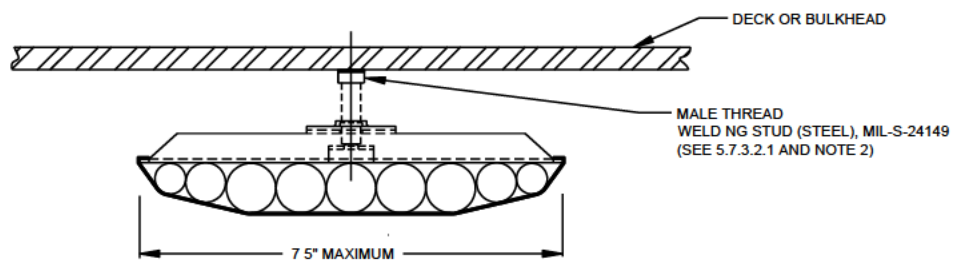

FIGURE 4C11. Single cableway on insulated steel structure secured with female welding stud.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-12-1  
SINGLE TIER SECURED WITH WELD STUD  
ON STEEL DECKS AND BULKHEADS  
(MAXIMUM CABLE WEIGHT: 10 POUNDS PER SUPPORT)  
(LOCAL RUNS ONLY)

METHOD 4C-12-2  
SINGLE TIER SECURED WITH WELD STUD  
ON STEEL DECKS AND BULKHEADS  
(MAXIMUM CABLE WEIGHT: 20 POUNDS PER SUPPORT)  
(LOCAL RUNS ONLY)

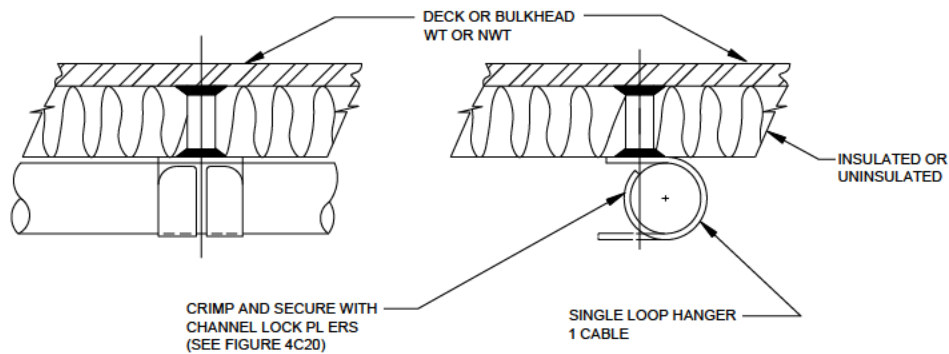

NOTES:

1. See C.4.3, tables [4CIII](#) and [4CIV](#), for internal thread welding stud material requirements.
2. See C.4.3, [table 4CV](#), for external thread welding stud material requirements. See 5.7.3.8 for collar and welding stud requirements.
3. For method 4C-12-2, the stud length shall not exceed 6 inches and the banding shall be single bands with no ferrules.
4. The hanger shown in method 4C-12-2 may be a Research Tool and Die RTG 7150 series or RTG 7150S series, or equal, see 4.8.

FIGURE 4C12. Single cableway on steel structure secured with welding stud.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-13-1  
SINGLE LOOP HANGER - BOTTOM LOADING (ONE CABLE)  
(SEE FIGURE 4C21 FOR ALTERNATE METHOD)

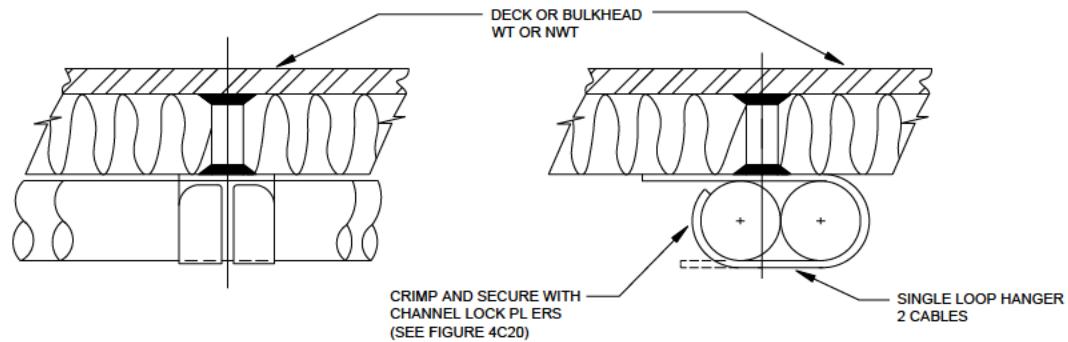

NOTES:

1. The crimp-on weld-stud type cable hanger may be used as an alternate to cable clamps (PCs 4C-22-1 and 4C-22-2) shown on [figure 4C22](#). See 5.7.3.8 for collar and welding stud requirements.
2. The weight of the cables supported shall not exceed 2 pounds per stud for the single loop hanger and 4 pounds per stud for the dual-loop hanger. The spacing between studs shall not exceed 32 inches.
3. The make of hangers procured shall have passed a high-impact shock test in accordance with MIL-DTL-901, and vibration test in accordance with MIL-STD-167-1, using the maximum hanger loadings and spacing.
4. The female weld stud method (attached to either the cable strap or the ship's structure) shown in method 4C-19-1 in figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1, and the female weld stud method shown in method 4C-19-2 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1 and 4C-21-1 and 4C-21-2. The stud method in method 4C-19-3 may be used as an alternate to methods 4C-13-1 through 4C-18-1.
5. Loop hangers installed topside and in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1.
6. See C.4.3, [table 4CVII](#), for material details and National Stock Number (NSN) of loop hangers used in this method.

FIGURE 4C13. Bottom loading hanger on steel and aluminum decks and bulkheads (one cable).

## MIL-STD-2003-4B(SH)

## APPENDIX 4C

METHOD 4C-14-1  
SINGLE LOOP HANGER - BOTTOM LOADING (TWO CABLES)

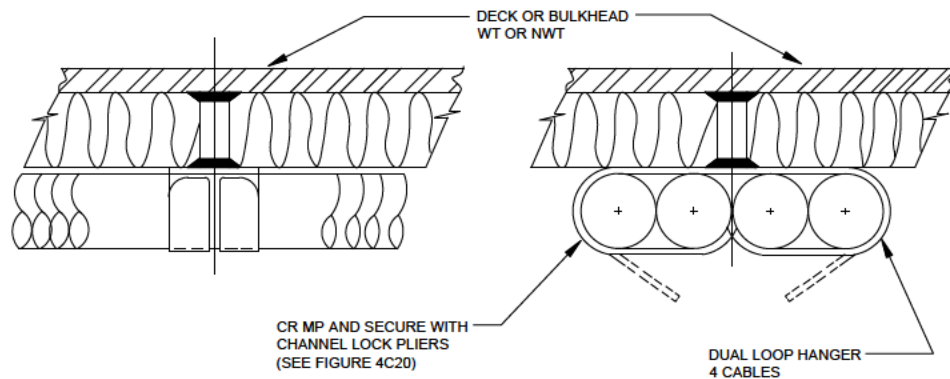

## NOTES:

1. The crimp-on weld-stud type cable hanger may be used as an alternate to cable clamps (PCs 4C-22-1 and 4C-22-2) shown on figure 4C22. See 5.7.3.8 for collar and welding stud requirements.
2. The weight of the cables supported shall not exceed 2 pounds per stud for the single loop hanger and 4 pounds per stud for the dual-loop hanger. The spacing between studs shall not exceed 32 inches.
3. The make of hangers procured shall have passed a high-impact shock test in accordance with MIL-DTL-901, and vibration test in accordance with MIL-STD-167-1, using the maximum hanger loadings and spacing.
4. The female weld stud method (attached to either the cable strap or the ship's structure) shown in method 4C-19-1 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1, and the female weld stud method shown in 4C-19- 2 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1 and 4C-21-1 and 4C-21-2. The stud method in method 4C-19-3 may be used as an alternate to methods 4C-13-1 through 4C-18-1.
5. Loop hangers installed topside and in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1.
6. See C.4.3, [table 4CVII](#), for material details and National Stock Numbers (NSN) of loop hangers used in this method.

FIGURE 4C14. Bottom loading hanger on steel and aluminum decks and bulkheads (two cables).

## MIL-STD-2003-4B(SH)

## APPENDIX 4C

METHOD 4C-15-1  
SINGLE LOOP HANGER - BOTTOM LOADING (FOUR CABLES)

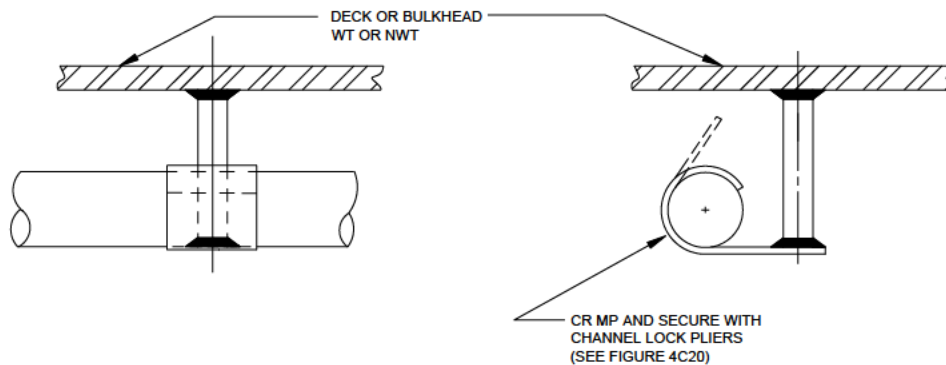

## NOTES:

1. The crimp-on weld-stud type cable hanger may be used as an alternate to cable clamps (PCs 4C-22-1 and 4C-22-2) shown on figure 4C22. See 5.7.3.8 for collar and welding stud requirements.
2. The weight of the cables supported shall not exceed 2 pounds per stud for the single loop hanger and 4 pounds per stud for the dual-loop hanger. The spacing between studs shall not exceed 32 inches.
3. The make of hangers procured shall have passed a high-impact shock test in accordance with MIL-DTL-901, and vibration test in accordance with MIL-STD-167-1, using the maximum hanger loadings and spacing.
4. The female weld stud method (attached to either the cable strap or the ship's structure) shown in method 4C-19-1 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1, and the female weld stud method shown in method 4C-19-2 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1 and 4C-21-1 and 4C-21-2. The stud method in method 4C-19-3 may be used as an alternate to methods 4C-13-1 through 4C-18-1.
5. Loop hangers installed topside and in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1.
6. See C.4.3, [table 4CVII](#), for material details and National Stock Numbers (NSN) of loop hangers used in this method.

FIGURE 4C15. Bottom loading hanger on steel and aluminum decks and bulkheads (four cables).

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-16-1  
SINGLE LOOP HANGER-TOP LOADING (ONE CABLE)  
(SEE FIGURE 4C21 FOR ALTERNATE METHOD)

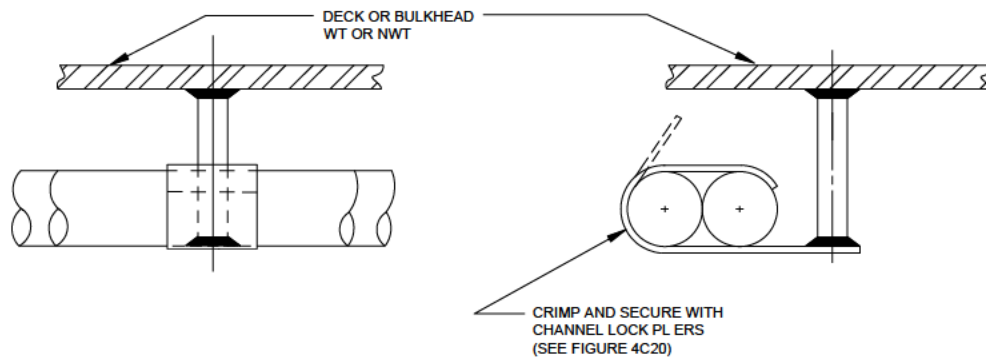

NOTES:

1. The crimp-on weld-stud type cable hanger may be used as an alternate to cable clamps (PCs 4C-22-1 and 4C-22-2) shown on [figure 4C224A22](#). See 5.7.3.8 for collar and welding stud requirements.
2. The weight of the cables supported shall not exceed 2 pounds per stud for the single loop hanger and 4 pounds per stud for the dual-loop hanger. The spacing between studs shall not exceed 32 inches.
3. The make of hangers procured shall have passed a high-impact shock test in accordance with MIL-DTL-901, and vibration test in accordance with MIL-STD-167-1, using the maximum hanger loadings and spacing.
4. The female weld stud method (attached to either the cable strap or the ship's structure) shown in method 4C-19-1 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1, and the female weld stud method shown in 4C-19-2 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1 and 4C-21-1 and 4C-21-2. The stud method in method 4C-19-3 may be used as an alternate to methods 4C-13-1 through 4C-18-1.
5. Loop hangers installed topside and in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1.
6. See C.4.3, [table 4CVII](#), for material details and National Stock Numbers (NSN) of loop hangers used in this method.

FIGURE 4C16. Top loading hanger on steel and aluminum decks and bulkheads (one cable).

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-17-1  
SINGLE LOOP HANGER-TOP LOADING (TWO CABLES)

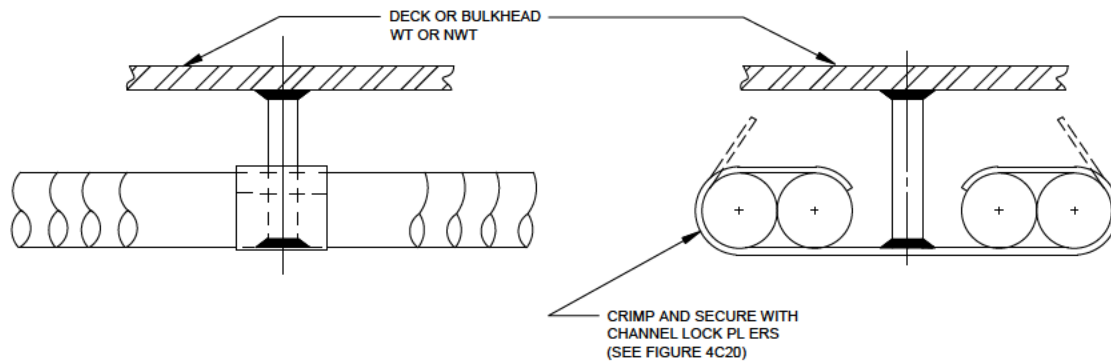

NOTES:

1. The crimp-on weld-stud type cable hanger may be used as an alternate to cable clamps (PCs 4C-22-1 and 4C-22-2) shown on figure 4C22. See 5.7.3.8 for collar and welding stud requirements.
2. The weight of the cables supported shall not exceed 2 pounds per stud for the single loop hanger and 4 pounds per stud for the dual-loop hanger. The spacing between studs shall not exceed 32 inches.
3. The make of hangers procured shall have passed a high-impact shock test in accordance with MIL-DTL-901, and vibration test in accordance with MIL-STD-167-1, using the maximum hanger loadings and spacing.
4. The female weld stud method (attached to either the cable strap or the ship's structure) shown in method 4C-19-1 in figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1, and the female weld stud method shown in method 4C-19-2 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1 and 4C-21-1 and 4C-21-2. The stud method in method 4C-19-3 may be used as an alternate to methods 4C-13-1 through 4C-18-1.
5. Loop hangers installed topside and in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1.
6. See C.4.3, [table 4CVII](#), for material details and National Stock Numbers (NSN) of loop hangers used in this method.

FIGURE 4C17. Top loading hanger on steel and aluminum decks and bulkheads (two cables).

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-18-1  
SINGLE LOOP HANGER-TOP LOADING (FOUR CABLES)

NOTES:

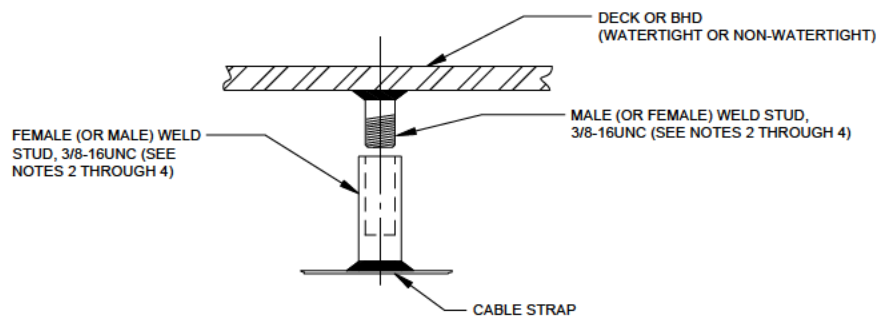

1. The crimp-on weld-stud type cable hanger may be used as an alternate to cable clamps (PCs 4C-22-1 and 4C-22-2) shown on figure 4C22. See 5.7.3.8 for collar and welding stud requirements.
2. The weight of the cables supported shall not exceed 2 pounds per stud for the single loop hanger and 4 pounds per stud for the dual-loop hanger. The spacing between studs shall not exceed 32 inches.
3. The make of hangers procured shall have passed a high-impact shock test in accordance with MIL-DTL-901, and vibration test in accordance with MIL-STD-167-1, using the maximum hanger loadings and spacing.
4. The female weld stud method (attached to either the cable strap or the ship's structure) shown in method 4C-19-1 in figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1, and the female weld stud method shown in method 4C-19-2 of figure 4C19 may be used as an alternate to methods 4C-13-1 through 4C-18-1 and 4C-21-1 and 4C-21-2. The stud method in method 4C-19-3 may be used as an alternate to methods 4C-13-1 through 4C-18-1.
5. Loop hangers installed topside and in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1.
6. See C.4.3, [table 4CVII](#), for material details and National Stock Numbers (NSN) of loop hangers used in this method.

FIGURE 4C18. Top loading hanger on steel and aluminum decks and bulkheads (four cables).

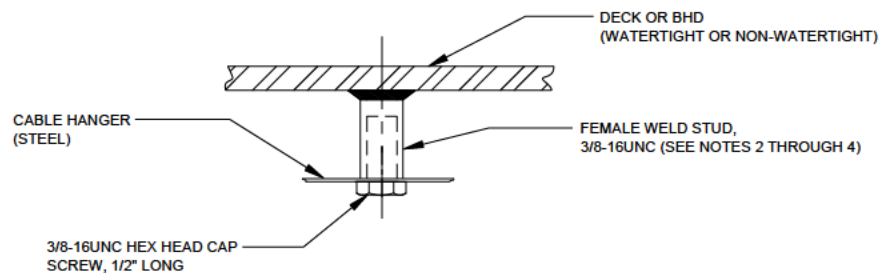

## MIL-STD-2003-4B(SH)

## APPENDIX 4C

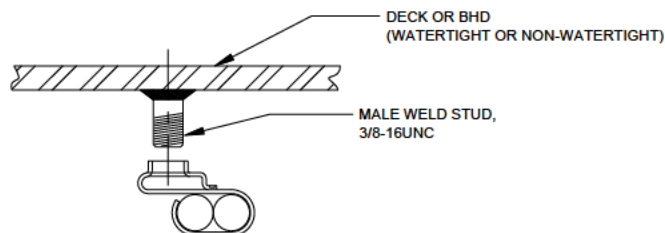

METHOD 4C-19-1  
FEMALE WELD STUD METHOD  
(MAY BE USED AS AN ALTERNATE TO METHODS 4C-13-1 THROUGH 4C-18-1)  
SEE NOTE 1

METHOD 4C-19-2  
FEMALE WELD STUD METHOD  
(MAY BE USED AS ALTERNATE TO METHODS 4C-13-1 THROUGH 4C-18-1  
AND 4C-21-1 AND 4C-21-2)  
SEE NOTE 1

METHOD 4C-19-3  
(MAY BE USED AS ALTERNATE TO METHODS 4C-13-1 THROUGH 4C-18-1)  
SEE NOTE 1

## NOTES:

1. The female weld stud method (attached to either the cable strap or the ship's structure) shown in method 4C-19-1 may be used as an alternate to methods 4C-13-1 through 4C-18-1, and the female weld stud method shown in method 4C-19-2 may be used as an alternate to methods 4C-13-1 through 4C-18-1 and 4C-21-1 and 4C-21-2. The stud method in method 4C-19-3 may be used as an alternate to methods 4C-13-1 through 4C-18-1.
2. Studs with aluminum male threads shall be coated with anti-seize compound.

FIGURE 4C19. Single cableway on steel and aluminum decks and bulkheads, weld stud.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

NOTES (continued):

3. The contact of steel female threads with aluminum male threads shall be coated with anti-seize compound. All thread coating shall occur after the stud welding is complete.
4. See C.4.3, [table 4CV](#), for external thread welding stud material information.
5. For method 4C-19-3, the weight limit is 5.3 pounds per hanger.
6. See 5.7.3.8 for collar and welding stud requirements.
7. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4C19. Single cableway on steel and aluminum decks and bulkheads, weld stud – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

CRIMPING METHODS

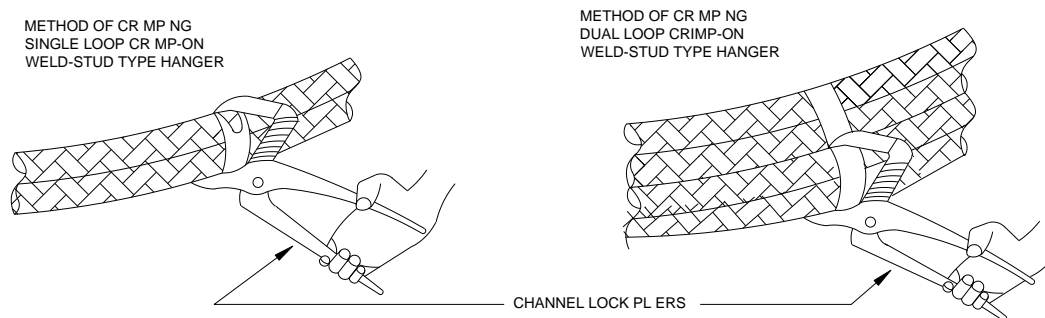

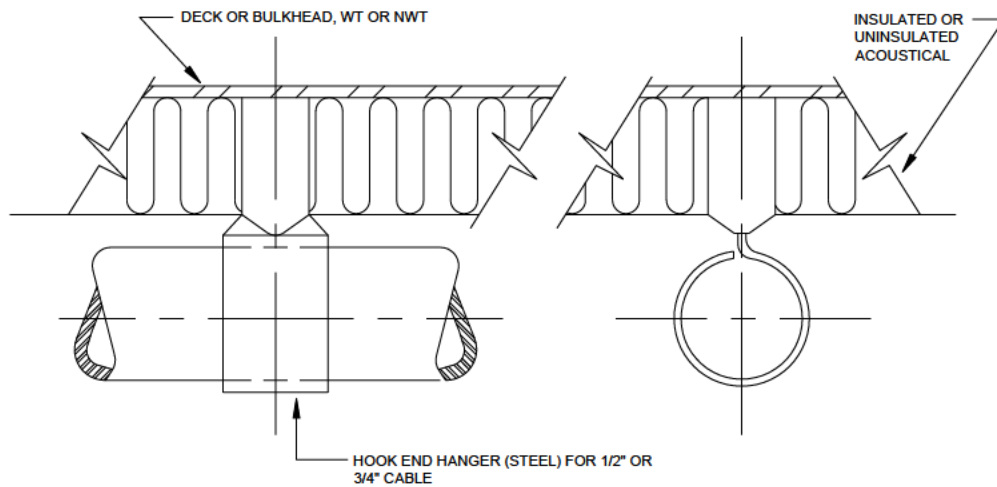

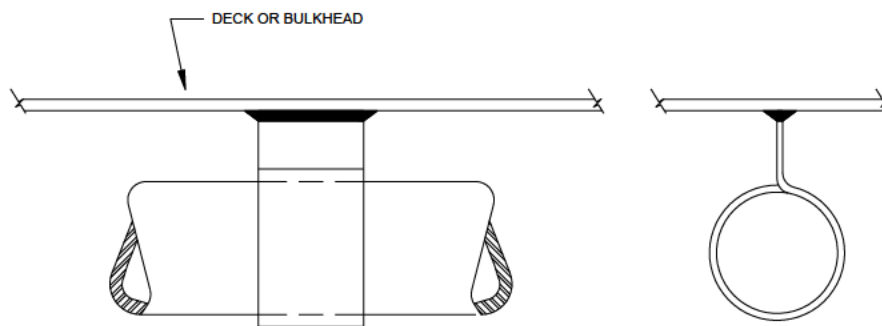

FIGURE 4C20. Single cableway on steel and aluminum decks and bulkheads, crimping methods.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-21-1  
SINGLE CABLEWAY ON STEEL AND ALUMINUM DECKS, INSULATED  
SEE NOTE 1

METHOD 4C-21-2  
SINGLE CABLEWAY ON STEEL AND ALUMINUM DECKS, UNINSULATED  
SEE NOTES 1 THROUGH 3

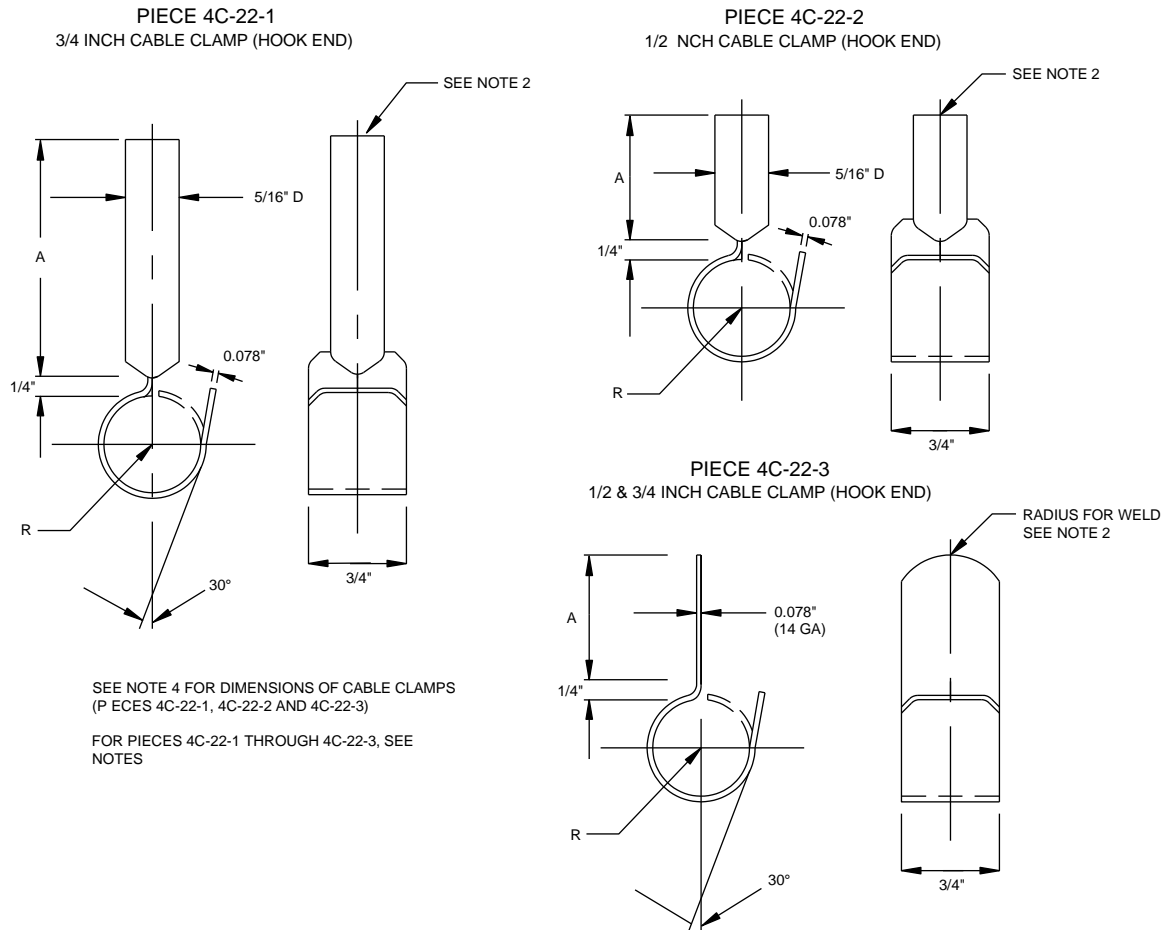

NOTES:

1. The female weld stud method (attached to either the cable strap or the ship's structure) shown in method 4C-19-1 may be used as an alternate to methods 4C-13-1 through 4C-18-1, and the female weld stud method shown in method 4C-19-2 may be used as an alternate to methods 4C-13-1 through 4C-18-1 and 4C-21-1 and 4C-21-2. See 5.7.3.8 for collar and welding stud requirements.
2. Cable clamp hangers detailed as PCs 4C-22-1 through 4C-22-3 shall be unplated unless otherwise specified (see 5.7.3.2.1).
3. Hangers (4C-22-1 through 4C-22-3) on figure 4C22 shall be suitable for welding by the metal arc stud welding process.

FIGURE 4C21. Single cableway on aluminum decks and bulkheads.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

NOTES:

1. Cable clamp hangers detailed as PCs 4C-22-1 through 4C-22-3 shall be unplated unless otherwise specified ([see 5.7.3.2.1](#)).
2. Hangers (4C-22-1 through 4C-22-3) shall be suitable for welding by the metal arc stud welding process.
3. See C.4.3, [table 4CVII](#), for material details and National Stock Numbers (NSN) of loop hangers used in this method.
4. The applicable piece number and size (e.g., 4C-22-2-H) shall be stamped on each hook end hanger in 1/8-inch letters ([see table 4C22-I](#)).

FIGURE 4C22. Cable clamps for single cableway on steel and aluminum decks and bulkheads.

	K	$\frac{3}{4}$	3	$\frac{3}{8}$

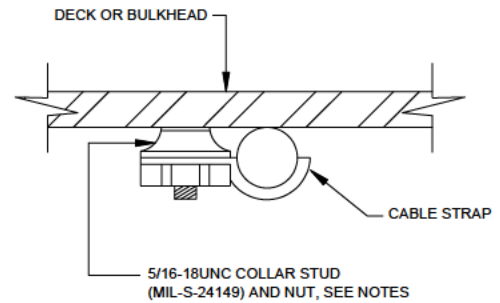

FIGURE 4C22. Cable clamps for single cableway on steel and aluminum decks and bulkheads – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

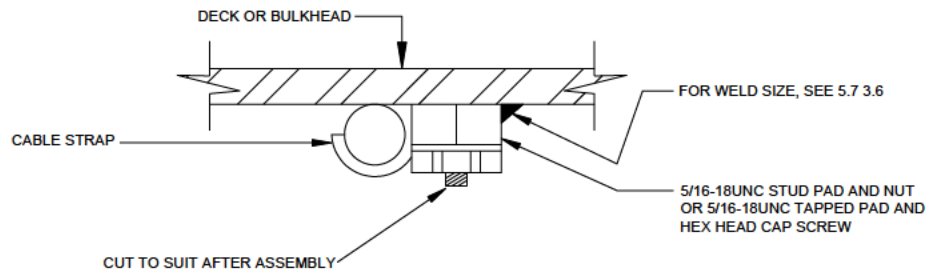

METHOD 4C-23-1  
CABLES SECURED TO NON-WATER-TIGHT BULKHEADS  
(FOR CABLES 5/8" DIA MAXIMUM)  
(SEE NOTES 1 THROUGH 3)

METHOD 4C-23-2  
CABLES SECURED WITH COLLAR STUDS  
(FOR CABLES 5/8" DIA MAXIMUM)  
(SEE NOTES 1 THROUGH 3)

METHOD 4C-23-3  
CABLES SECURED WITH PADS  
(CABLES 5/8" DIA MAXIMUM)  
(SEE NOTES 1 THROUGH 3)

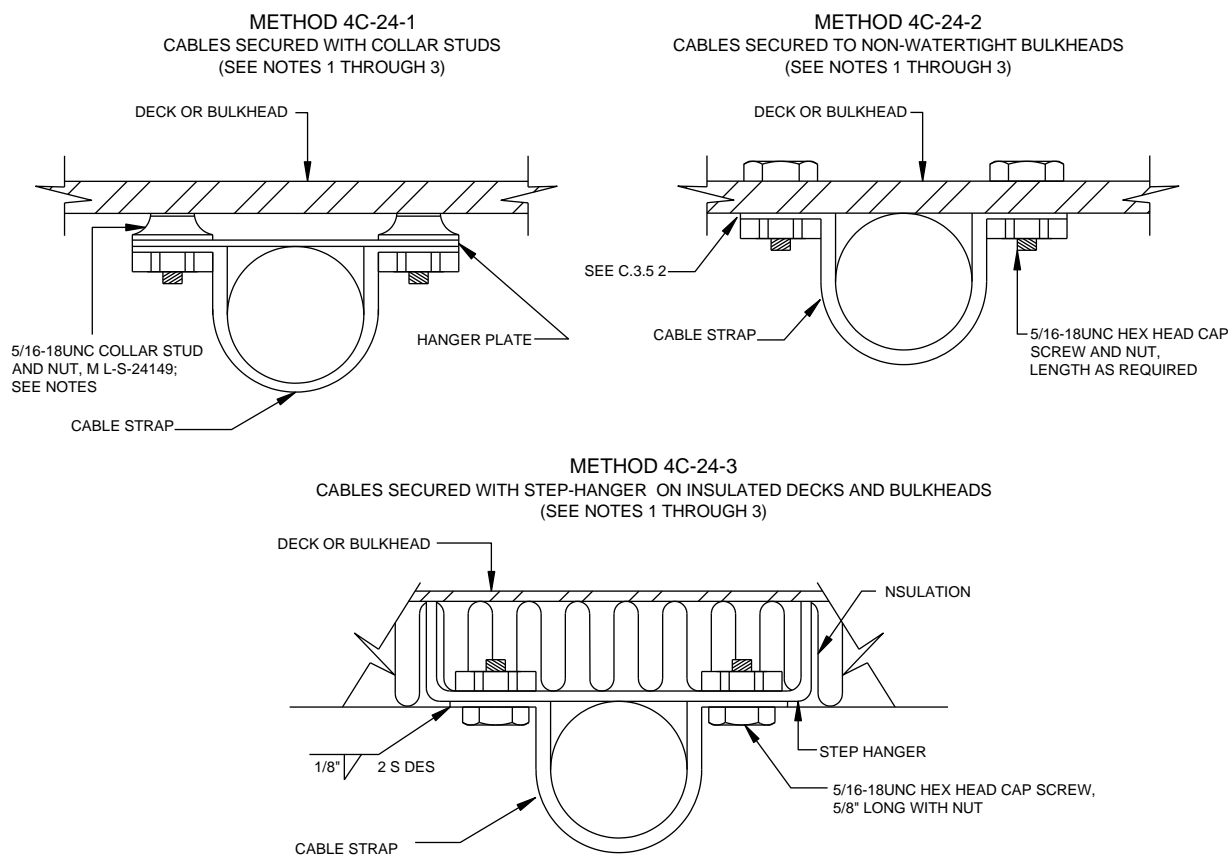

NOTES:

1. All hanger material shall be the same as bulkhead material.
2. Cable strap shall not dent or otherwise exert pressure on the semi-solid dielectric coaxial cables in any of these methods. Add spacer washers if necessary to keep cable free of pressure.
3. Collar studs, stud pads, and tapped pads installed topside or in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1. See 5.7.3.8 for collar and welding stud requirements.
4. See C.4.3, [table 4CVI](#), for material details and National Stock Numbers (NSN) for collar studs used in this method.
5. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4C23. Single cableway for coaxial cable.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

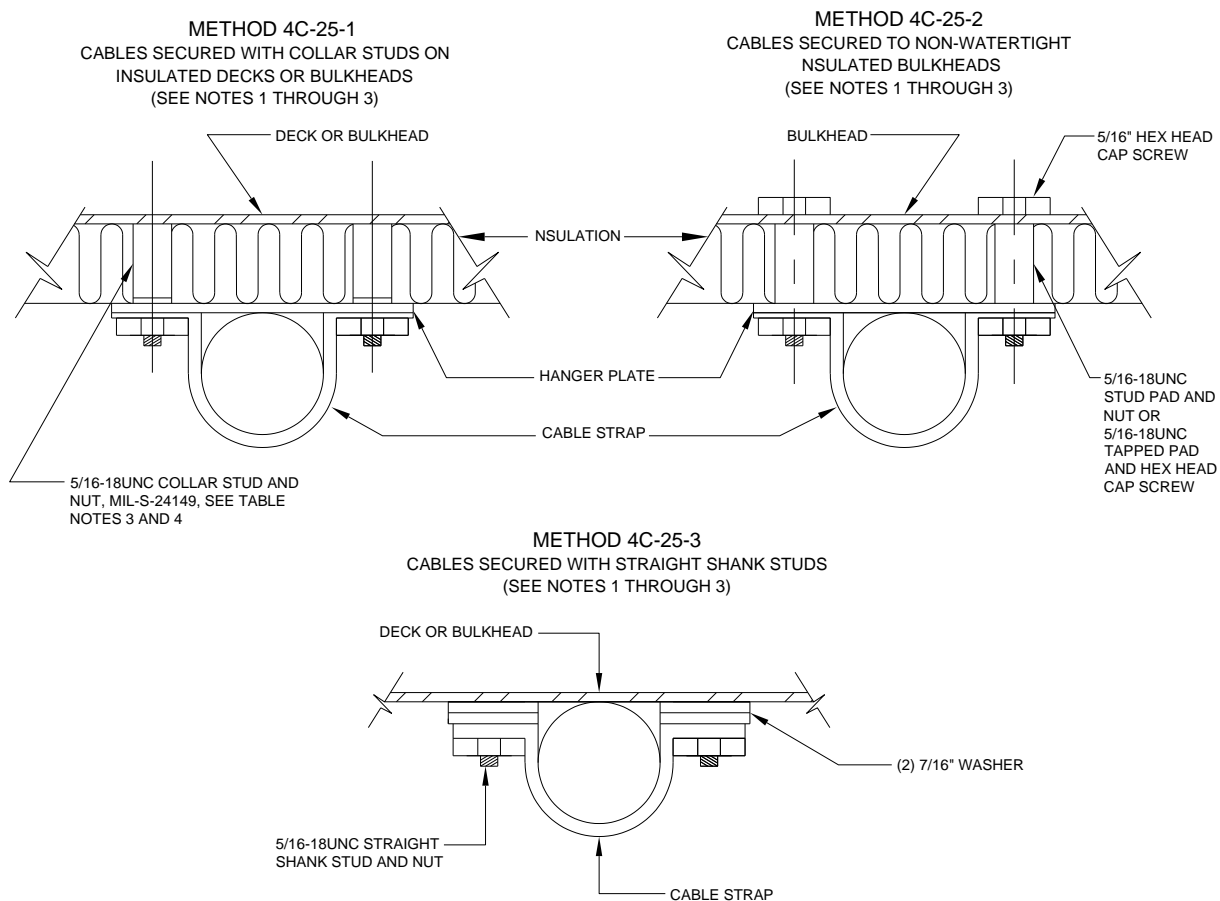

NOTES:

1. All hanger material shall be the same as bulkhead material.
2. Cable strap shall not dent or otherwise exert pressure on the semi-solid dielectric coaxial cables in any of these methods. Add spacer washers if necessary to keep cable free of pressure.
3. Collar studs, stud pads, and tapped pads installed topside or in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1. See 5.7.3.8 for collar and welding stud requirements.
4. See C.4.3, [table 4CVI](#), for material details and National Stock Numbers (NSN) collar studs used in this method.
5. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4C24. Single cableway for coaxial cable.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

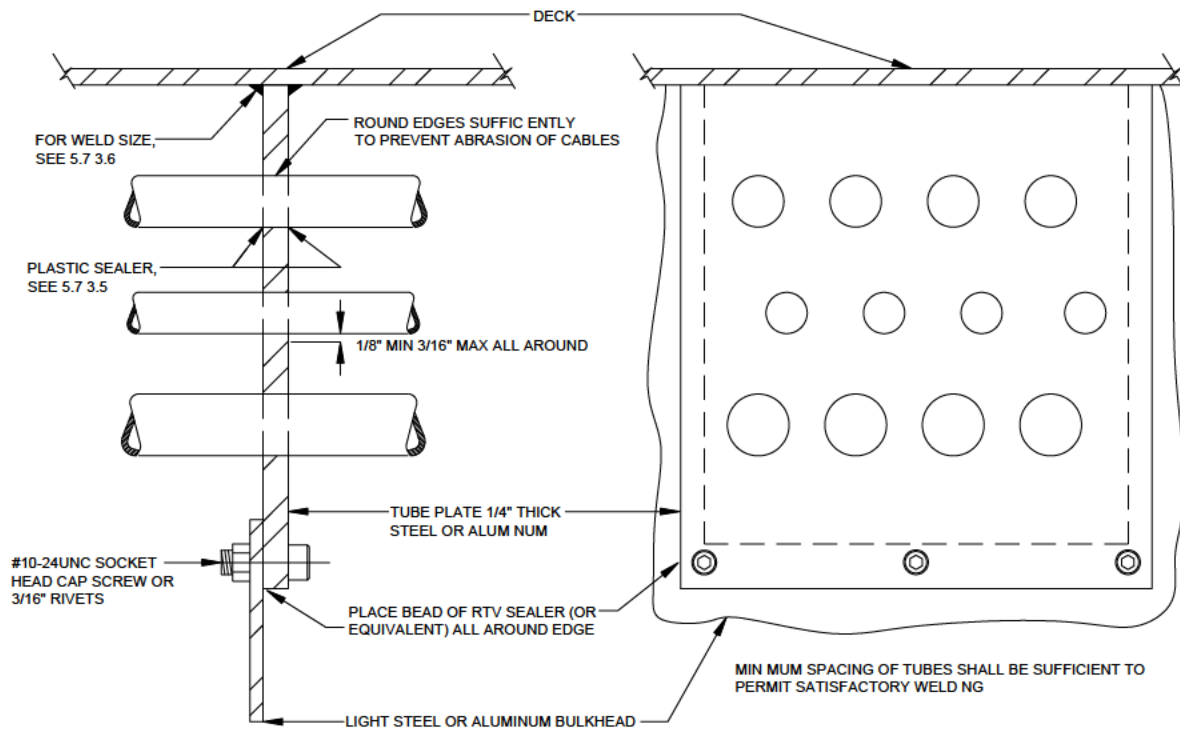

NOTES:

1. All hanger material shall be the same as bulkhead material.
2. Cable strap shall not dent or otherwise exert pressure on the semi-solid dielectric coaxial cables in any of these methods. Add spacer washers if necessary to keep cable free of pressure.
3. Collar studs, stud pads, and tapped pads installed topside or in locations subject to a corrosive environment shall be in accordance with 5.7.3.2.1. See 5.7.3.8 for collar and welding stud requirements.
4. See C.4.3, [table 4CVI](#), for material details and National Stock Numbers (NSN) collar studs used in this method.
5. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4C25. Single cableway for coaxial cable.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-26-1  
MULTIPLE TUBES OF CABLES THROUGH LIGHT BULKHEAD WITH AIR  
AND FUME TIGHTNESS REQUIREMENTS

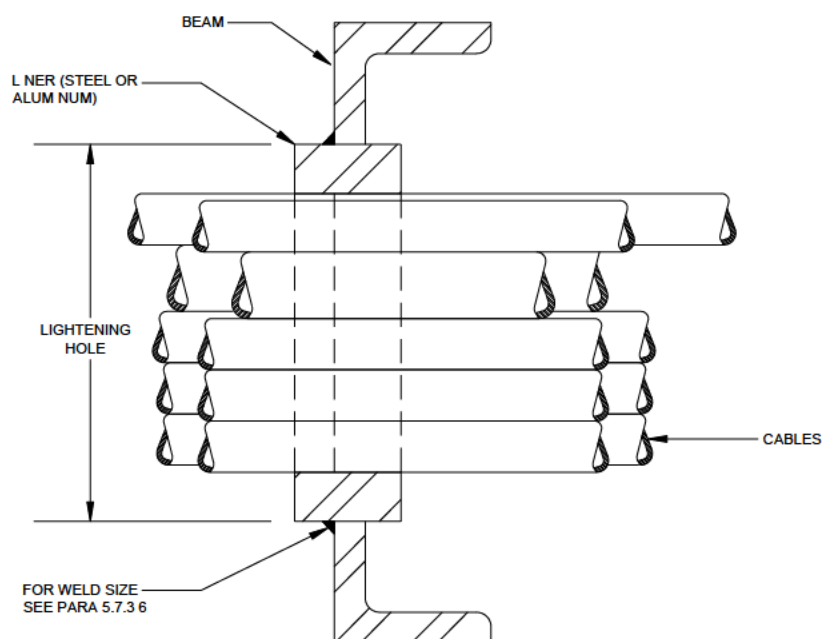

NOTES:

1. When holes are cut in the ship's structure solely for the passage of cables, the replacement tube plate shall be of sufficient weight to compensate for the loss of strength due to the metal removed.
2. Spacing of cables shall be sufficient to permit satisfactory welding.
3. The space between the cable and the inside of the drilled hole shall be thoroughly packed with plastic sealer (MIL-I-3064, type HF) to form a permanent light-tight seal.
4. See 5.7.3.7 for fastener and fastener material requirements.

FIGURE 4C26. Cableway through non-watertight bulkheads and beams without fire stops.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-27-1  
CABLES THROUGH LIGHTENING HOLES OR CABLEWAYS  
IN STRUCTURAL MEMBERS (NON-LIGHT TIGHT)

NOTES:

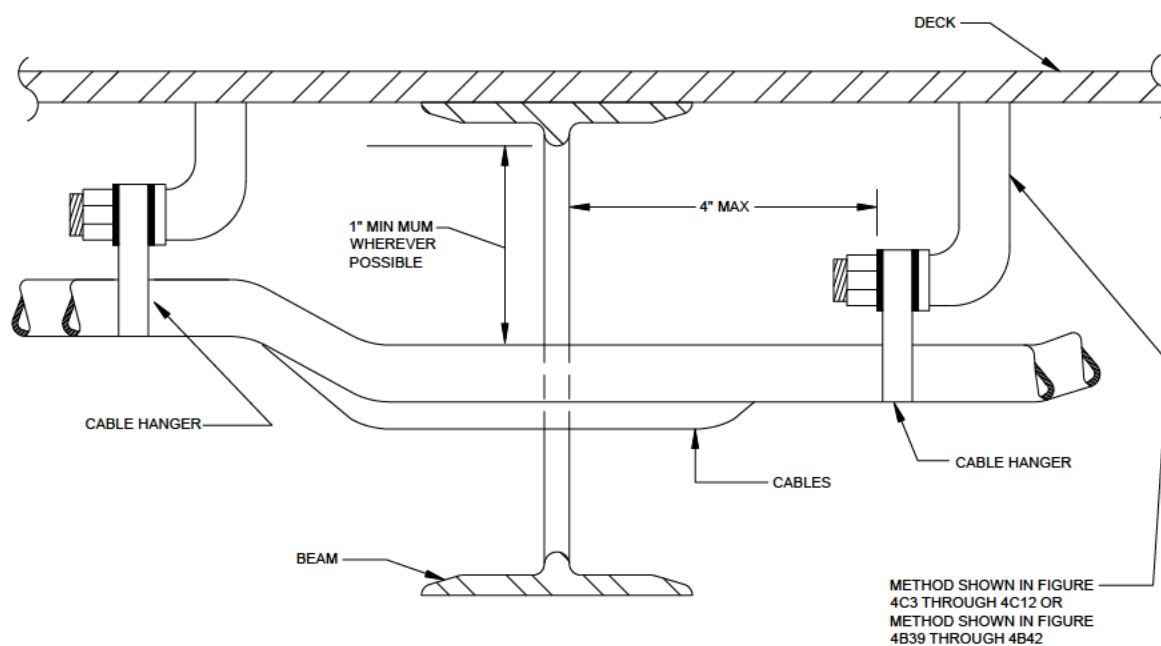

1. When holes are cut in the ship's structure solely for the passage of cables, the liner shall be of sufficient weight to compensate for the loss of strength due to the metal removed.
2. Liners  $\frac{1}{16}$  inch thick can be used as an alternate to half round bar.
3. Installation of liner in beams may be made in shop or on the ship.
4. Where no lightening holes are provided, cables may be run outside of beam when no interference with either equipment or normal headroom results.

FIGURE 4C27. Cableway through non-watertight bulkheads and beams without fire stops.

## MIL-STD-2003-4B(SH)

## APPENDIX 4C

METHOD 4C-28-1  
 A GROUP OF CABLES  
 PASSING THROUGH LIGHTENING HOLES  
 (LIGHTENING HOLES NOT USED AS SUPPORT)

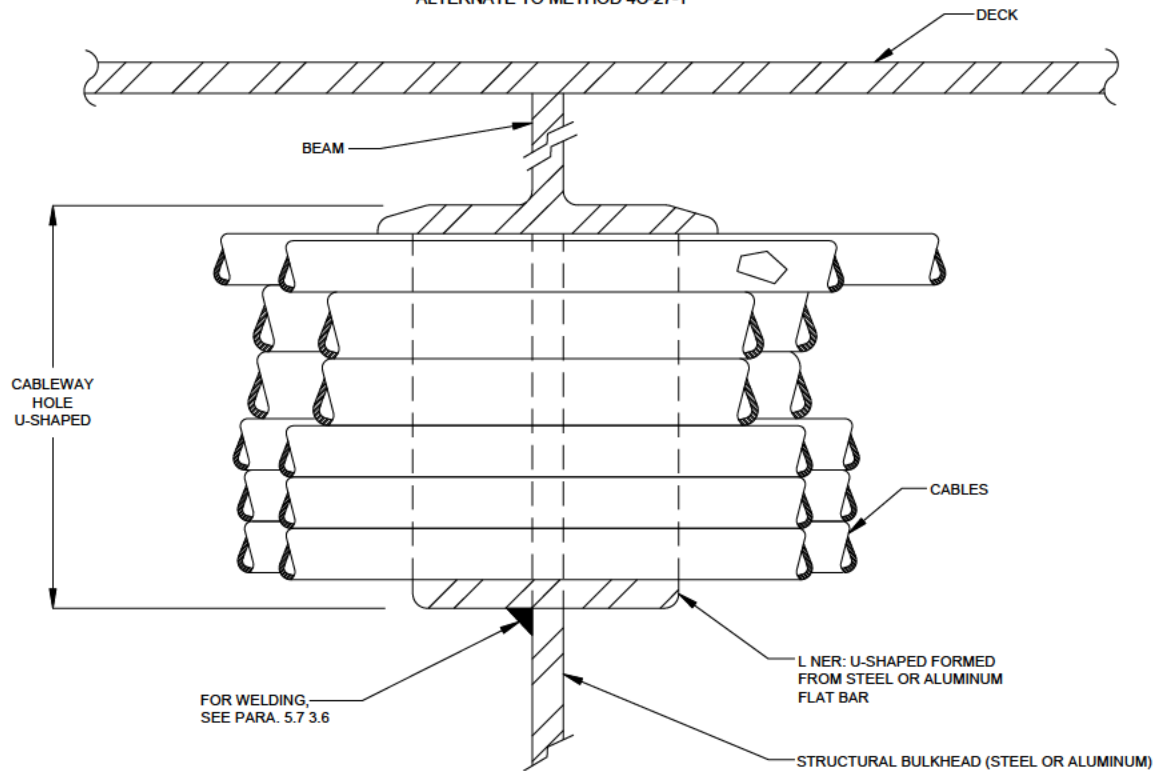

## NOTE:

1. Where no lightening holes are provided, cables may be run outside of beam when no interference with either equipment or normal headroom results.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-31-1  
CABLES THROUGH BULKHEADS AND  
BEAMS 1/4" THICKNESS AND OVER

METHOD 4C-31-2  
INSULATED BULKHEAD OR BEAM CABLE THROUGH TUBING

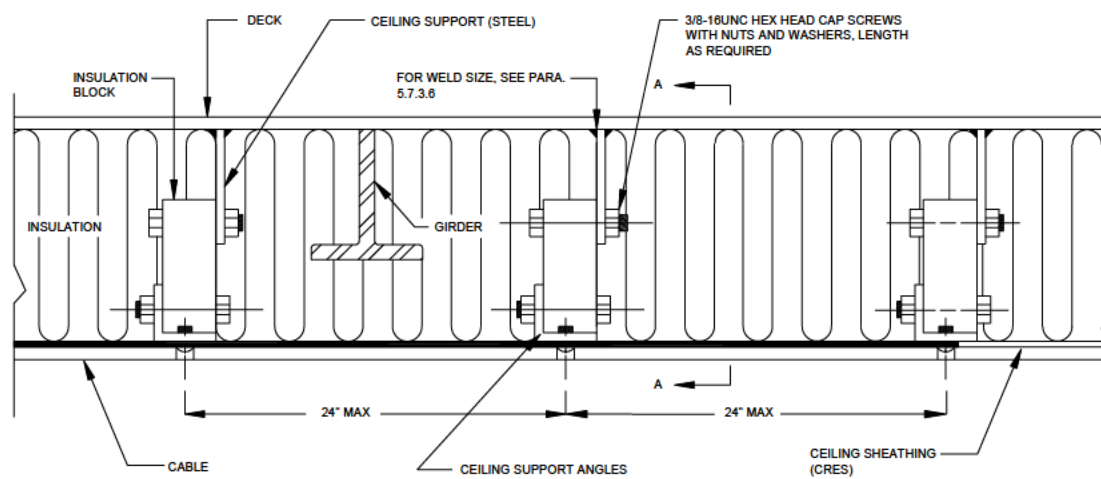

NOTES:

1. When holes are cut in the ship's structure solely for the passage of cables, the liner shall be of sufficient weight to compensate for the loss of strength due to the metal removed.
2. Installation of liner in beams may be made in shop or on the ship.
3. Where no lightening holes are provided, cables may be run outside of beam when no interference with either equipment or normal headroom results.
4. When cables pierce non-watertight bulkheads required to be light-tight, the space between the cable and the inside of the bushing tubing or drilled hole shall be thoroughly packed with plastic sealer (MIL-I-3064, type HF) to form a permanent light-tight seal.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-38-1  
S NGLE CABLE HANGER CLIP USED IN CONJUNCTION WITH INSULATION STUD CAP

NOTES:

1. This hanger clip is for cable  $\frac{1}{2}$  inch in diameter or less and weighing  $\frac{1}{4}$  pound per foot or less.
2. Where a maximum length of the cable is installed along the surface of the hull board insulation and it is necessary to originate or terminate the run outside the insulation boundary, this hanger may be used for continuation of the run if advantageous to do so.
3. The material shall be spring steel, spheroidized, ASTM A713, Rockwell hardness 45-55, zinc electro-plated in accordance with ASTM B633, type I, thickness class FE-ZN 8 for Service Condition (SC) 2.

FIGURE 4C38. Single cableway on hullboard insulation.

APPENDIX 4C

METHOD 4C-40-1  
CABLES PASSING THROUGH LIGHTENING HOLES WITH FIRE STOP  
(FOR NON-WATERTIGHT CABLE PENETRATIONS AND FOR AIRTIGHT AND  
FLAMETIGHT SPACES WHERE APPLICABLE)

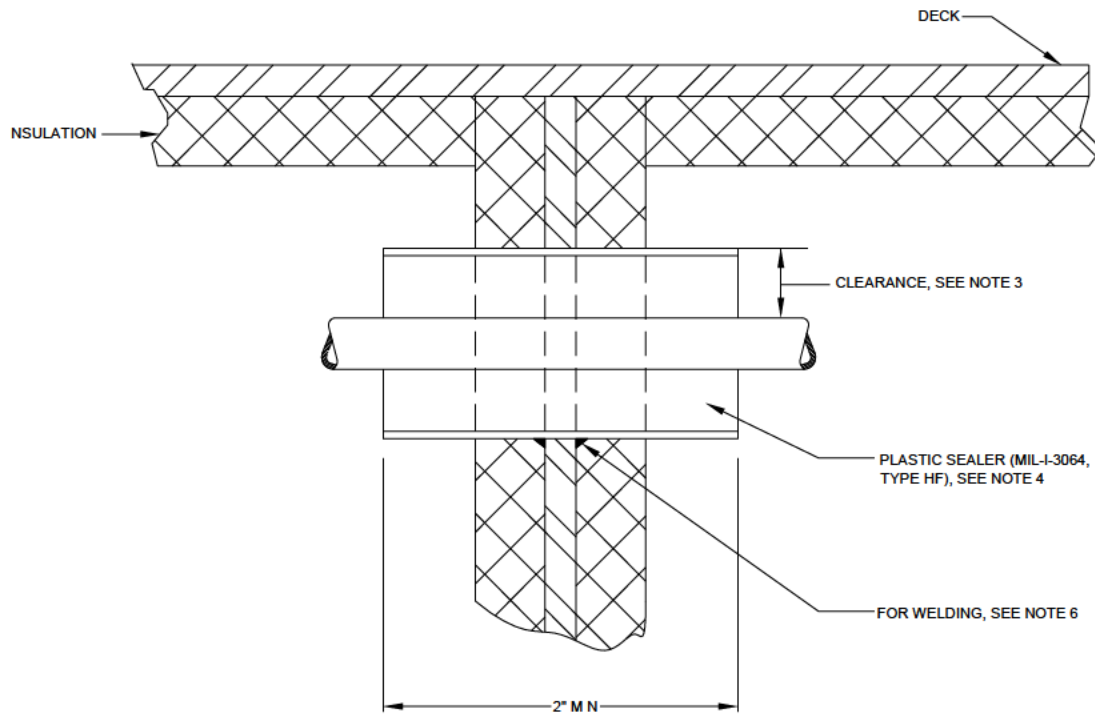

NOTES:

1. Fire stop methods are for non-watertight cable penetrations and also for airtight and flametight spaces where applicable.
2. Stuffing tubes (tubing, collars, and liners) shall be steel for steel structures and aluminum for aluminum structures.
3. The minimum clearance space around cables before packing material is applied shall be  $\frac{1}{4}$  inch for a single cable and 1 inch for multiple cables.
4. Pack thoroughly around and between cables with plastic sealer, MIL-I-3064, type HF.
5. Stuffing unit may be attached by all-around weld, tack weld, or fasteners provided that the attachment conforms to the structural and tightness requirements of the bulkhead or member to which it is attached.
6. All welding shall be in accordance with 5.7.3.6.
7. For existing installations, stuffing units may be split lengthwise for installing over cable.
8. See penetration stuffing requirements for airtight bulkheads and fume-tight bulkheads in MIL-STD-2003-3.

FIGURE 4C40. Cableway through non-watertight bulkheads and beams with fire stops.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-47-1  
MULTIPLE CABLE PENETRATION THRU NON-WATERTIGHT  
BULKHEADS OR STRUCTURAL MEMBERS WITH FIRE STOPS  
(EXISTING CABLE PENETRATIONS)

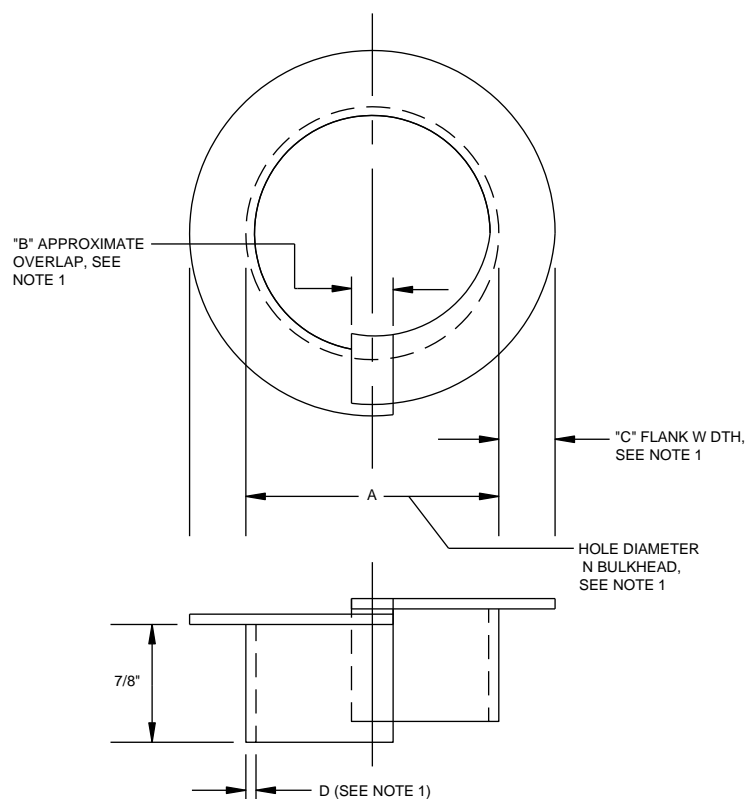

NOTES:

1. Fire stop methods are for non-watertight cable penetrations and also for airtight and flametight spaces where applicable.
2. Stuffing tubes (tubing, collars, and liners) shall be steel for steel structures and aluminum for aluminum structures.
3. The minimum clearance space around cables before packing material is applied shall be  $\frac{1}{4}$  inch for a single cable and 1 inch for multiple cables.
4. Pack thoroughly around and between cables with plastic sealer, MIL-I-3064, type HF.
5. Stuffing unit may be attached by all-around weld, tack weld, or fasteners provided that the attachment conforms to the structural and tightness requirements of the bulkhead or member to which it is attached.
6. All welding shall be in accordance with 5.7.3.6.
7. For existing installations, stuffing units may be split lengthwise for installing over cable.
8. See penetration stuffing requirements for airtight bulkheads and fume-tight bulkheads in MIL-STD-2003-3.

FIGURE 4C47. Cableway through non-watertight bulkheads with fire stops, existing penetration.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

INSULATING LINERS FOR CABLE HOLES  
(LINERS MAY BE COMMERCIAL SIZES. MATERIAL SHALL BE VULCANIZED FIBER OR OTHER  
NON-TOXIC TYPE PLASTIC MATERIAL)  
SEE NOTE 1 FOR DIMENSIONS

NOTES:

1. Dimensions (in inches) for insulating liners are as follows:

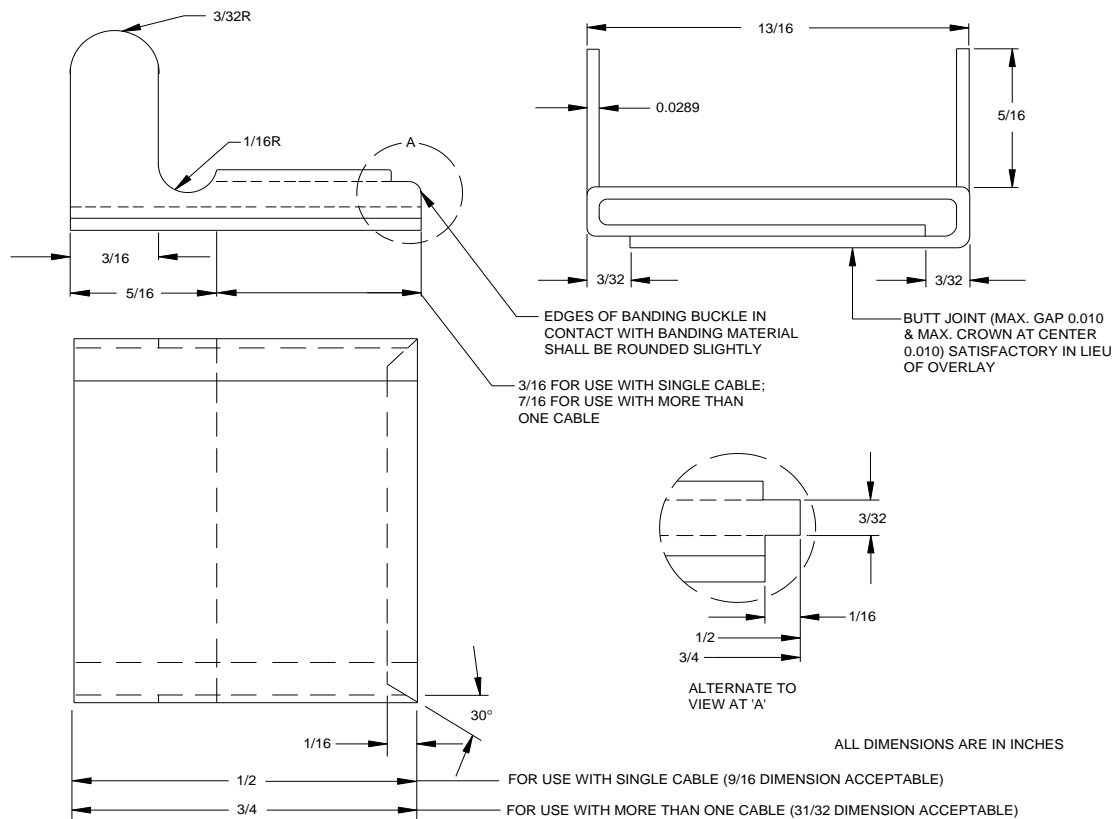

A	B	C	D
$\frac{3}{4}$	$\frac{3}{16}$	$\frac{1}{8}$	0.025
$1\frac{5}{32}$	$\frac{3}{16}$	$\frac{1}{8}$	0.025
$1\frac{7}{16}$	$\frac{3}{16}$	$\frac{5}{32}$	0.025
$1\frac{13}{16}$	$\frac{1}{4}$	$\frac{5}{32}$	0.030
$2\frac{1}{16}$	$\frac{1}{4}$	$\frac{5}{32}$	0.030
$2\frac{19}{32}$	$\frac{5}{16}$	$\frac{5}{32}$	0.030
$3\frac{5}{16}$	$\frac{3}{8}$	$\frac{7}{32}$	0.040
$3\frac{3}{8}$	$\frac{3}{8}$	$\frac{7}{32}$	0.040
$4\frac{1}{4}$	$\frac{7}{16}$	$\frac{7}{32}$	0.040

2. For details of the use of this liner, refer to method 4C-30-1, [figure 4C30](#).

FIGURE 4C48. Insulating liners for cable holes in beams and girders.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

METHOD 4C-49-1  
BANDING BUCKLE  
(SEE NOTES 1 THROUGH 3)

NOTES:

1. Banding buckles shall be made of corrosion-resistant steel, ASTM A240/A240M, ASTM A666, and ASTM A693.
2. The edges of the banding buckle in contact with the banding material shall be rounded slightly.
3. Specifications, vendor information, and part numbers for selected banding buckles are as specified in [table 4C49-I](#):

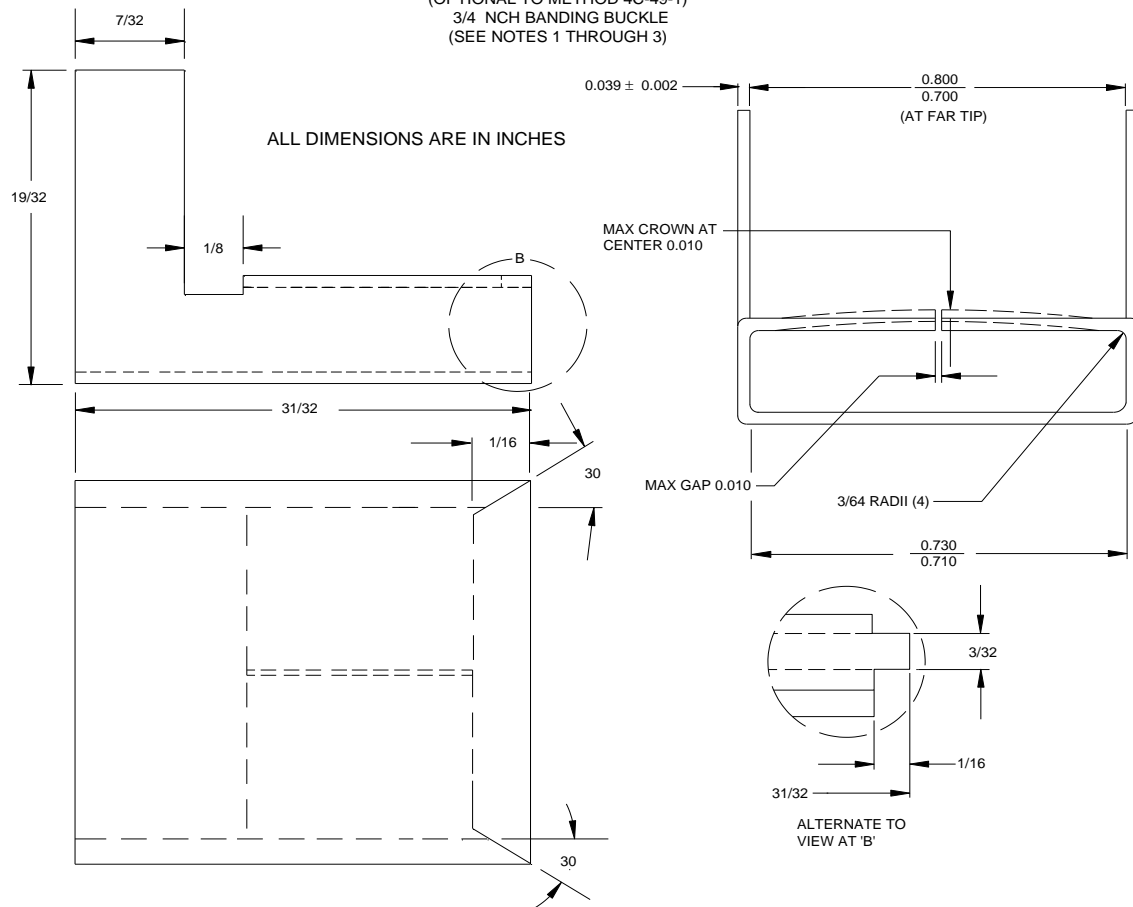

TABLE 4C49-I. Banding buckle sources and part numbers.

Buckle length (inch)	Commercial source (see 4.3)	Description/part number
1/2	Gerrard Packaging 2451 South Wolf Road, Des Plaines, IL 60018-2608, or equal	"Inverted Wing Seal" 202SS (stainless steel)

FIGURE 4C51. Cable banding buckle (inverted) and miscellaneous details.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

Method 4C-52-1

Banding of Cables in Cableways

ATTACHING BAND TO BUCKLE

1. Pull the banding material from the container and cut the desired length with a cable banding tool.
2. Place the banding material through the buckle towards the tabs on the buckle. See illustration 1.

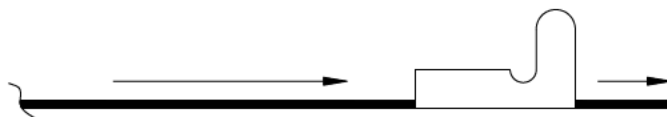

Illustration 1

3. Fold and crimp the end of the banding material under the buckle at the tabs using a pair of channel locks. See illustration 2.

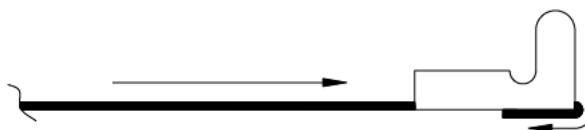

Illustration 2

4. Fold and crimp the banding material at the end of the buckle. See illustration 3.

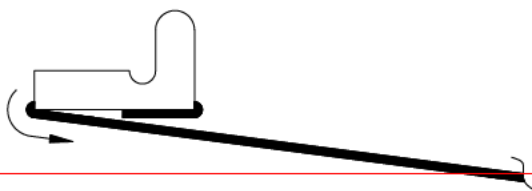

Illustration 3

5. Run the end of the banding material through the tabs of the buckle. See illustration 4.

Illustration 4

FIGURE 4C52. Applying banding material.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

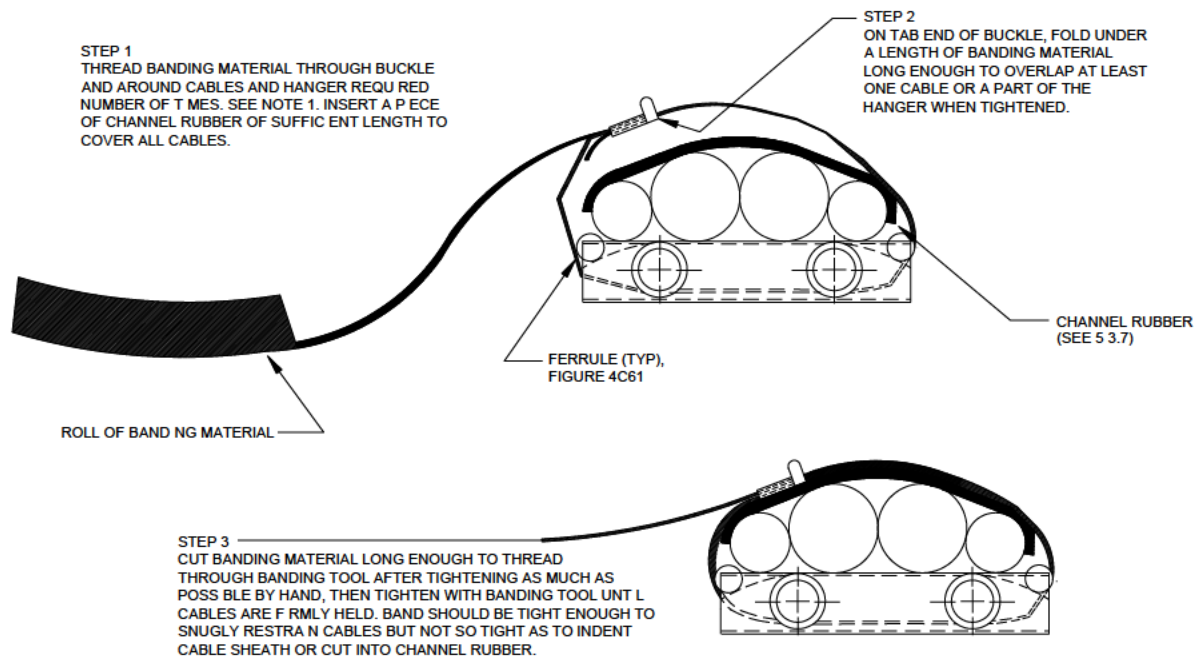

ATTACHING BAND TO BUCKLE (continued):

6. Pull tight and crimp the banding material at the tabs of the buckle. See illustration 5.

Illustration 5

APPLICATION OF BANDING MATERIAL

NOTES:

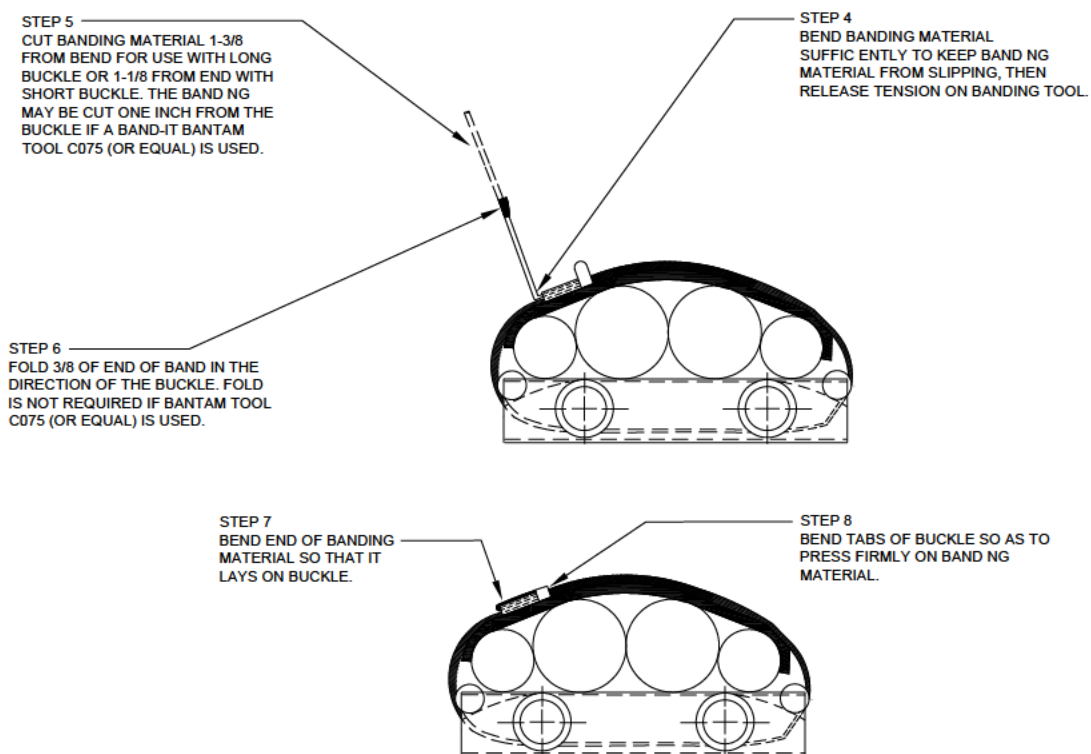

1. Banding general notes in C.4.4 apply.
2. [Figure 4C53](#) is a continuation of the banding steps in this figure.
3. Cable banding and channel rubber material are detailed in C.4.4, tables [4CVIII](#) through [4CXI](#).

APPENDIX 4C

SIDE MOUNTED TUBULAR HANGER  
4C-58-1 - ALUMINUM  
4C-58-2 - STEEL  
4C-58-3 - CRES

(CUT TUBULAR HANGERS TO LENGTHS REQUIRED IN TABULATIONS)  
TUBULAR HANGER DETAILED BELOW MAY BE USED AS ALTERNATE TO  
ITEMS 4C-59-1, 4C-59-2 AND 4C-59-3  
FERRULES ARE NOT REQUIRED FOR ITEMS 4C-58-1, 4C-58-2 AND 4C-58-3

NOTES:

1. Square tubing may be purchased in commercial lengths. Cut tubular hangers to the lengths required in tabulations.

FIGURE 4C58. Details of side mounted tubular hangers.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

NOTES (continued):

2. Dimensions for tubular hangers are as follows:

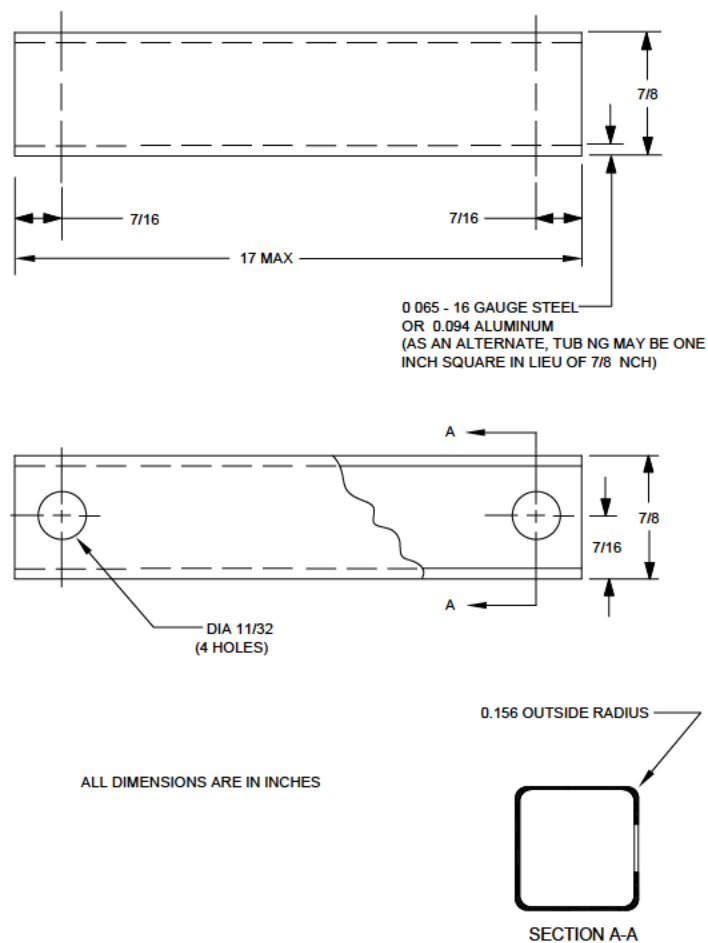

Item no.	Dimensions (inches)		
	A	B	C
4C-58-1 4C-58-2 4C-58-3	3	1½	2
	4	2½	3
	5	3½	4
	6	4½	5
	7	5½	6
	8	6½	7
	9	7½	8
	10	8½	9
	11	9½	10
	12	10½	11
	13	11½	12
	14	12½	13
	15	13½	14
	16	14½	15
	17	15½	16

3. Aluminum tubing shall be seamless drawn and in accordance with ASTM B241/B241M, temper 6.  
4. Steel tubing shall be hot rolled, weld seamflash in commercial grade.

FIGURE 4C58. Details of side mounted tubular hangers – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

SIDE MOUNTED TUBULAR HANGER

## APPENDIX 4C

FERRULE DETAILS  
(SEE NOTES 1 AND 2 BELOW)

## NOTES:

1. Ferrules shall be formed or extruded steel, aluminum, or nylon, commercial grade.
2. All dimensions are in inches.

FIGURE 4C61. Tubular banding hangers ferrule details.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

NOTE:

1. The purpose of this figure is to illustrate implementation of the formula given in 5.7.3.1.g for cable spacing from a hard-mounted component to the first hanger.

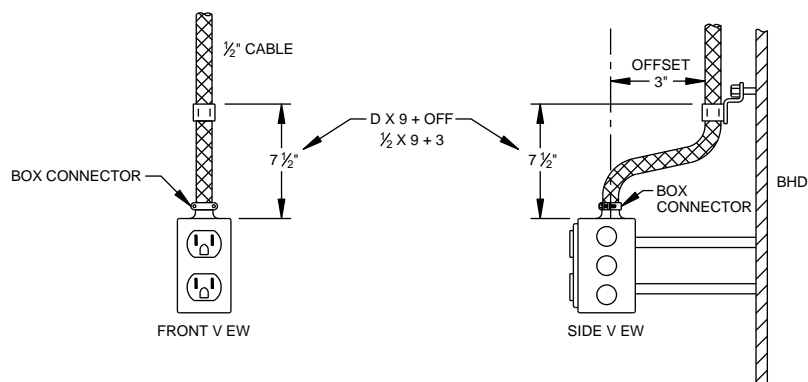

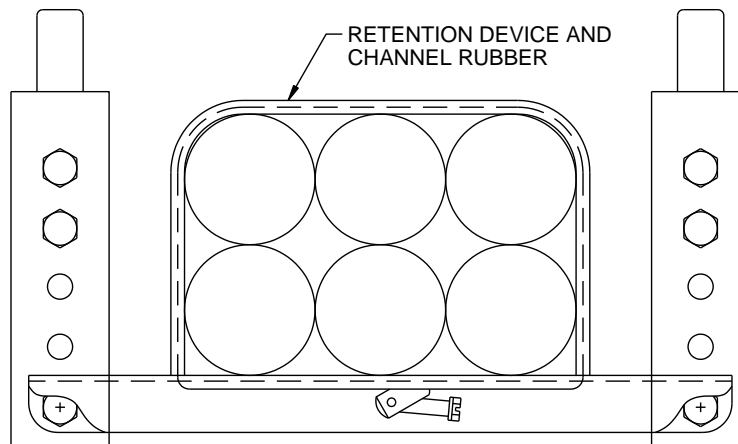

FIGURE 4C62. Illustration of distance to first hanger for hard mounted equipment.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

NOTES:

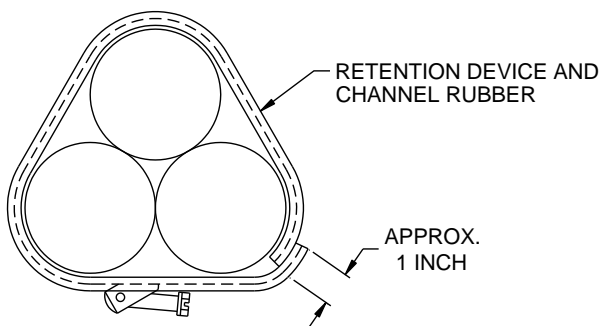

1. Purpose: This method is applicable to the installation of single conductor, medium and high-voltage electrical cable up to a 15 kilovolt rating and to dedicated medium and high-voltage cableways.
2. This method is intended to provide guidance. Engineered Class or individual NAVSEA approved ship drawings take precedence over this drawing.
3. Single conductor medium and high-voltage cables should be routed in dedicated cableways or in separate tiers in a cableway to the maximum extent practicable, separated from other cables. This preference is to prevent effects of cable heating and to prevent electro-magnetic interference effects on other cables. This separation in cableways is covered by this standard by routing other cables in separate tiers no less than 6 inches from the single conductor medium and high-voltage cables.
4. Electrical cables, other than medium or high-voltage cables, installed in cableways parallel to and beneath dedicated medium or high-voltage cableways, should maintain at least 6 inches of separation.
5. No more than a single row of three conductor or triads of single conductor medium or high-voltage cables should be installed in a cableway hanger tier.
6. Cableway hangers should have sufficiently wide tiers to allow adjacent triads of single conductor medium or high-voltage cables to be separated by at least one cable diameter.
7. For 15 kilovolt cableways, the inside radius of bend should be at least 31 inches.
8. Each triad of single conductor medium or high voltage cables shall contain one cable of each phase of power. Phases of the single conductor cables within a triad should suit ship arrangements.
9. Follow spacing requirements of 5.7.3.1 as amended by applicable ship specifications and NAVSEA approved ship drawings.
10. Each triad should be banded together at an evenly spaced location between hanger assemblies or penetrations when spacing is between 16 and 32 inches.
11. See 4.8 for cable bundling and ampacity requirements.

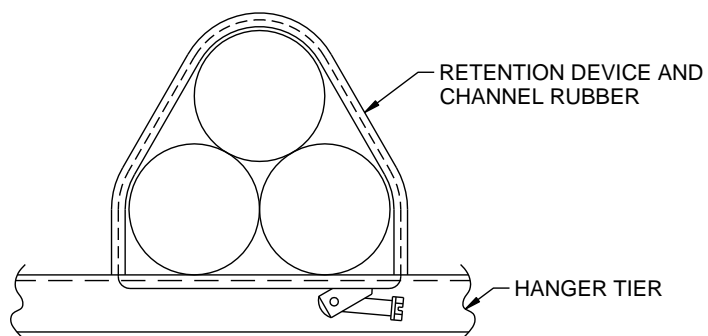

OPTIONAL ARRANGEMENT FOR 2 TRIADS ON HANGER  
PRIOR TO GOING THROUGH A PENETRATION

FIGURE 4C63. Installation of medium and high voltage cableways.

MIL-STD-2003-4B(SH)  
APPENDIX 4C

~~TYPICAL TRIAD RETENTION BETWEEN SUPPORTS~~  
NOTE: TO OBTAIN AN APPROX. 1 INCH OVERLAP, A 15 INCH LENGTH OF CHANNEL RUBBER MAY BE USED.

APPENDIX 4C

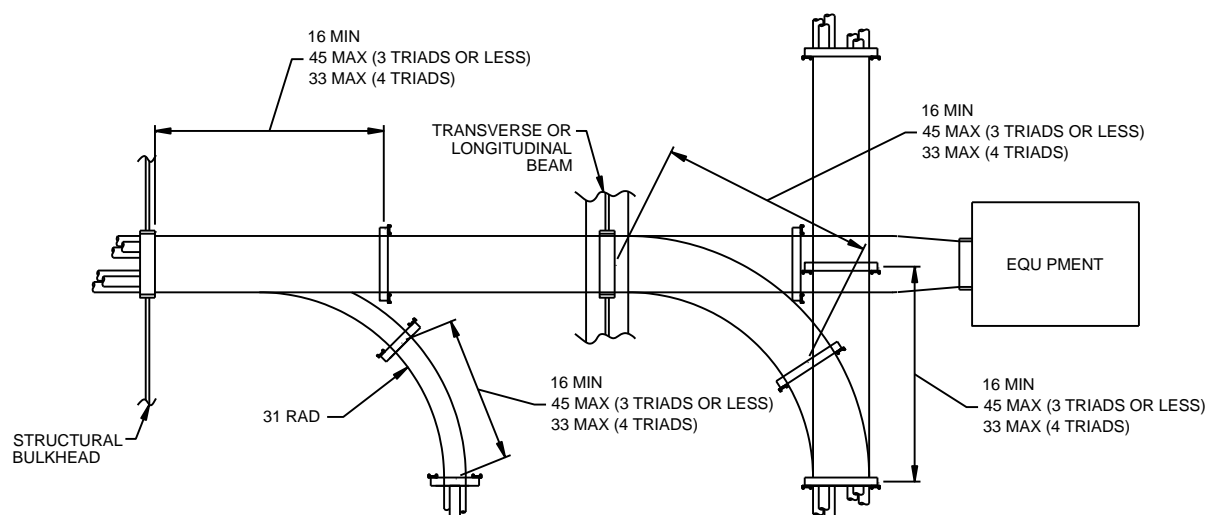

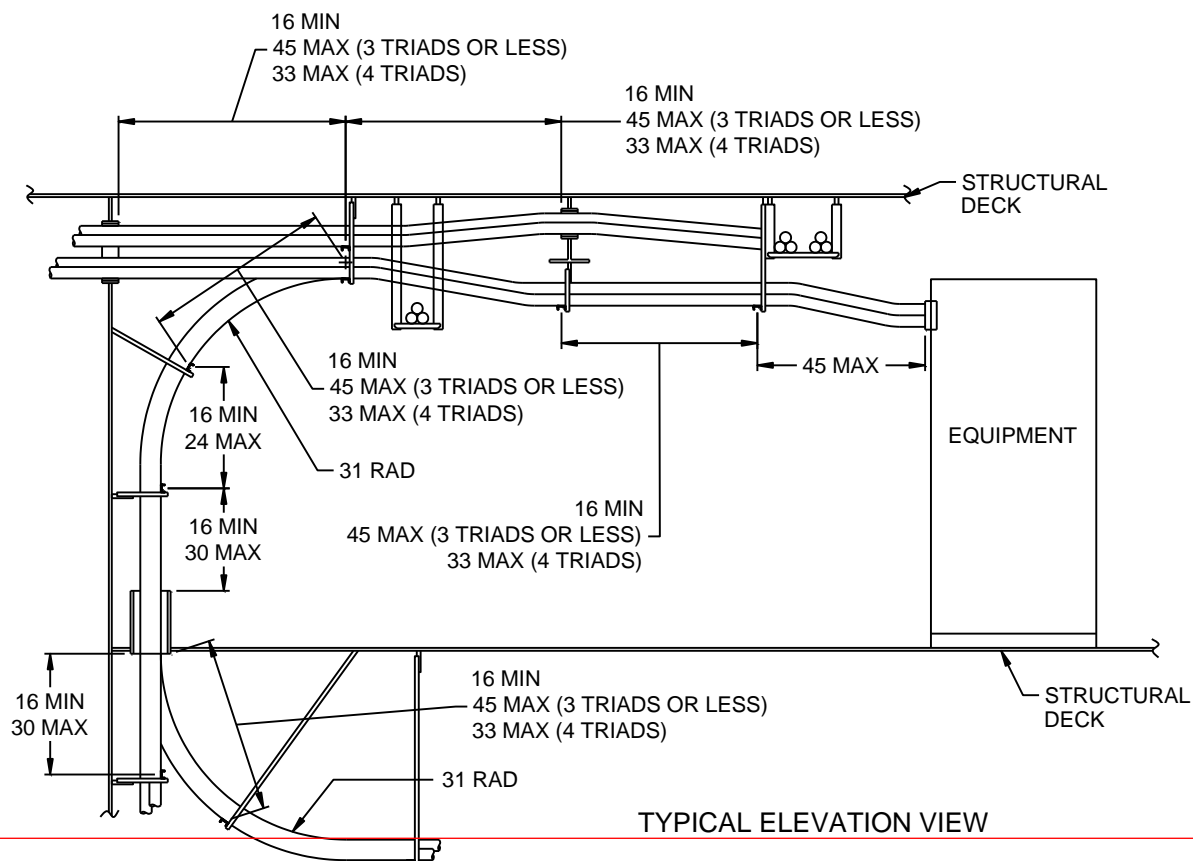

FIGURE 4C63. Installation of medium and high voltage cableways – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

APPENDIX 4D – CABLE PROTECTION

## D.1 SCOPE

D.1.1 Scope. This appendix describes cable protection procedures related to the installation of cableways on submarines and surface ships. This appendix is a mandatory part of the standard. The information contained herein is intended for compliance.

## D.2. APPLICABLE DOCUMENTS

D.2.1 General. The documents listed in this section are specified in this appendix. This section does not include documents cited in other sections of this standard or recommended for additional information or as examples. While every effort has been made to ensure the completeness of this list, document users are cautioned that they must meet all specified requirements of documents cited in this appendix, whether or not they are listed.

### D.2.2 Government documents.

D.2.2.1 Specifications, standards, and handbooks. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those cited in the solicitation or contract.

### COMMERCIAL ITEM DESCRIPTIONS

A-A-3041 - Wrench, Open End Ratchet (TAC Pattern) for Tube Fitting, Electrical Cable Terminals, and Stuffing Tube Gland Nuts

### DEPARTMENT OF DEFENSE SPECIFICATIONS

MIL-Y-1140 - Yarn, Cord, Sleeving, Cloth and Tape-Glass

MIL-R-17882 - Repair Kits, Metallic Pipe and General Purpose, Damage Control

MIL-R-21607 - Resins, Polyester, Low Pressure Laminating, Fire-Retardant

MIL-P-21929 - Plastic Material, Cellular Polyurethane, Foam-in-Place, Rigid (2 Pounds Per Cubic Foot)

MIL-PRF-23236 - Coating Systems for Ship Structures

MIL-S-24235 - Stuffing Tubes, Metal, and Packing Assemblies for Electric Cables, General Specification for

### DEPARTMENT OF DEFENSE STANDARDS

MIL-STD-2003-3 - Electric Plant Installation Standard Methods for Surface Ship and Submarines (Penetrations)

MIL-STD-2042-4 - Fiber Optic Cable Topology Installation Standard Methods for Surface Ships and Submarines (Cableways)

(Copies of these documents are available online at <https://quicksearch.dla.mil>.)

D.2.3 Order of precedence. Unless otherwise noted herein or in the contract, in the event of a conflict between the text of this document and the references cited herein, the text of this document takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

## D.3 REQUIRED EQUIPMENT AND MATERIALS

D.3.1 Required equipment and materials. The equipment and materials in the tables and referenced in the text of this section shall be used for the protection of cables. For fiber optic cable, refer to MIL-STD-2042-4. Refer to 5.7.3.7 for requirements regarding the use of mounting fasteners.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

#### D.4 NOTES AND PROCEDURES

D.4.1 Dimensions. For tables and figures in this appendix, all dimensions are in inches unless otherwise noted.

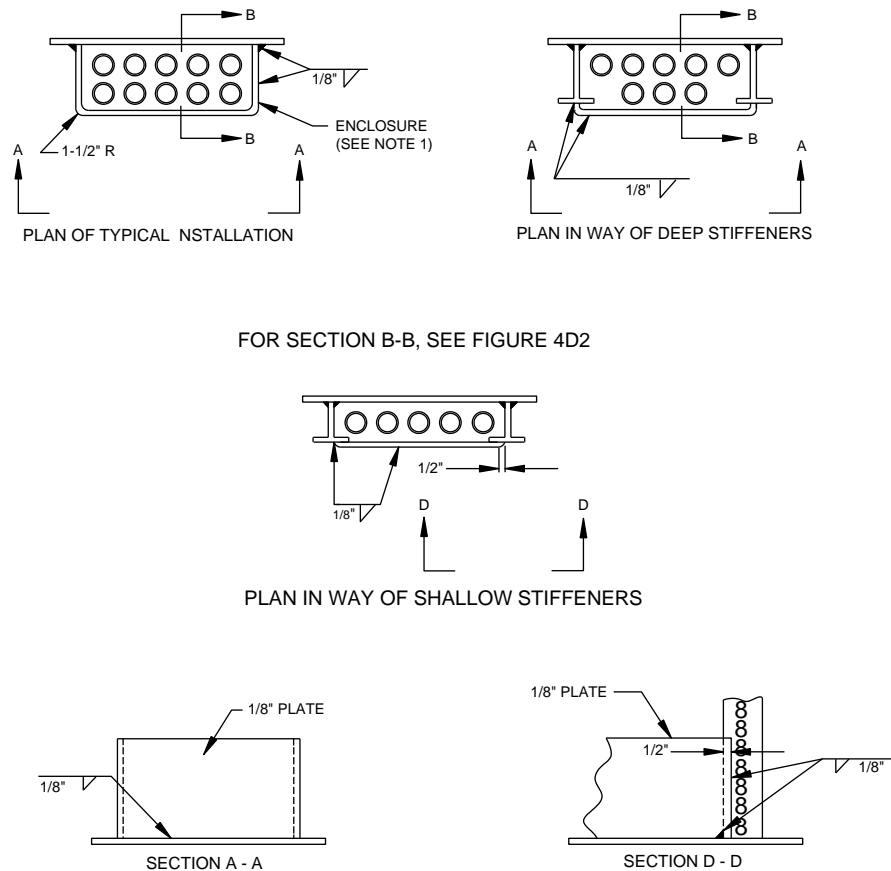

D.4.2 Figures. [Table 4DI](#) provides information for the figures in this appendix. The details and methods shown on figures 4D1 through 4D29 specify protection requirements and procedures for cables installed on surface ships and submarines as specified on the figures.

TABLE 4DI. Figures for cable protection surface ships and submarines.

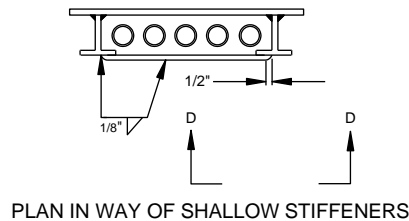

Figure number	Title	Page
4D1	Protection of cables penetrating watertight decks	290
4D2	Protection of cables penetrating watertight decks – wet spaces	291
4D3	Protection of cables penetrating watertight decks – dry areas	293
4D4	Protection of cables penetrating watertight decks – alternate method	295
4D5	Protection of cables penetrating watertight decks (alternate method) – section A-A	296
4D6	Protection of cables penetrating non-watertight (N.W.T.) decks	298

MIL-STD-2003-4B(SH)  
APPENDIX 4D

NOTE: Figures 4D1 through 4D3 provide information for the protection of cables penetrating watertight decks. The length and width of the enclosure shall suit the cable group. The size of the stuffing tube group in decks and bulkheads shall be limited such as to permit re-tightening of all gland nuts in the group by ships force using a stuffing tube wrench set (NSN 5120-00-293-0013), A-A-3041.

FOR SECTION B-B, SEE FIGURE 4D2

SEE METHODS 4D-2-1 AND 4D-3-1

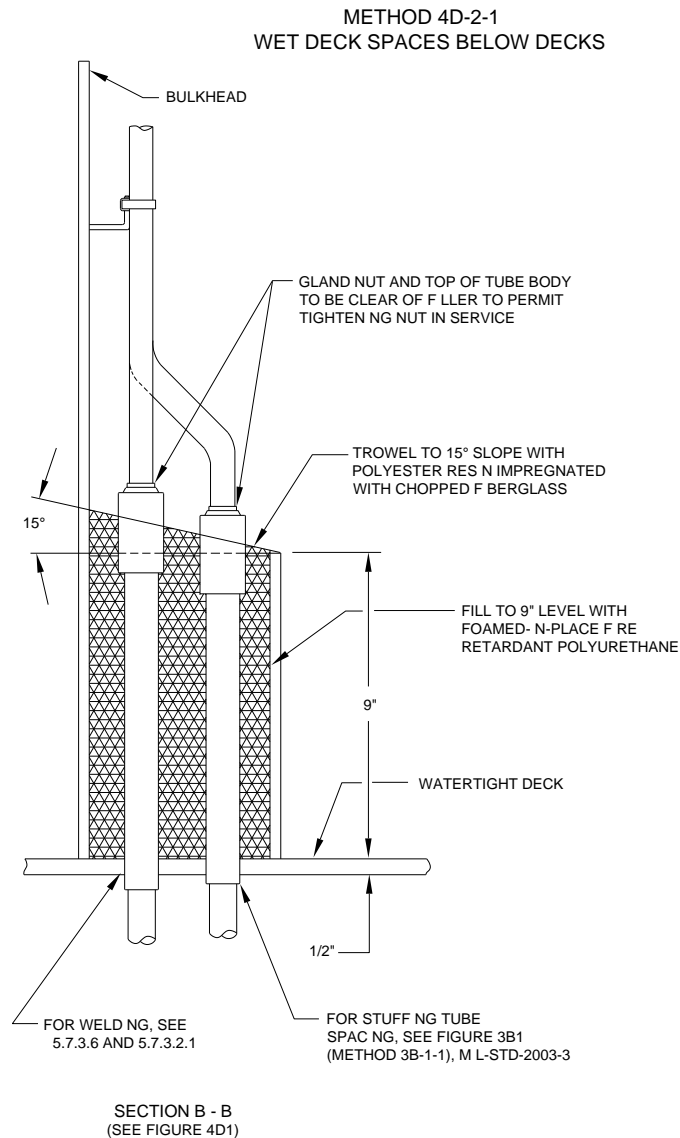

NOTES:

1. Surfaces in contact with plastics shall be thoroughly cleaned and free of oil or grease.
2. The finished 15-degree surface shall be smooth.
3. These enclosures may be used on steel or aluminum alloy structures using 1/8-inch steel or 1/8-inch aluminum to suit.
4. These enclosures shall not be installed until after all cables are installed and compartments are checked for tightness.
5. These enclosures shall not be installed on the weather decks.
6. Collar height shall be 3 inches in dry areas below decks.
7. Collar height shall be 9 inches in wet deck spaces below decks such as washrooms and sculleries.
8. A glass-reinforced collar may be used in lieu of a metal collar.

FIGURE 4D1. Protection of cables penetrating watertight decks.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

NOTE: Figures 4D1 through 4D3 provide information for the protection of cables penetrating watertight decks. The length and width of the enclosure shall suit the cable group. The size of the stuffing tube group in decks and bulkheads shall be limited such as to permit re-tightening of all gland nuts in the group by ships force using a stuffing tube wrench set (NSN 5120-00-293-0013), A-A-3041.

NOTES:

1. This method is not for use in weather applications.
2. Collar height shall be 9 inches in wet deck spaces below decks such as washrooms and sculleries.
3. Surfaces in contact with plastics shall be thoroughly cleaned and free of oil or grease.
4. The finished 15-degree surface shall be smooth.

FIGURE 4D2. Protection of cables penetrating watertight decks – wet spaces.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

NOTES (continued):

5. Material shall be in accordance with [table 4D2-I](#):

TABLE 4D2-I. Material for protection of cables  
penetrating watertight decks.

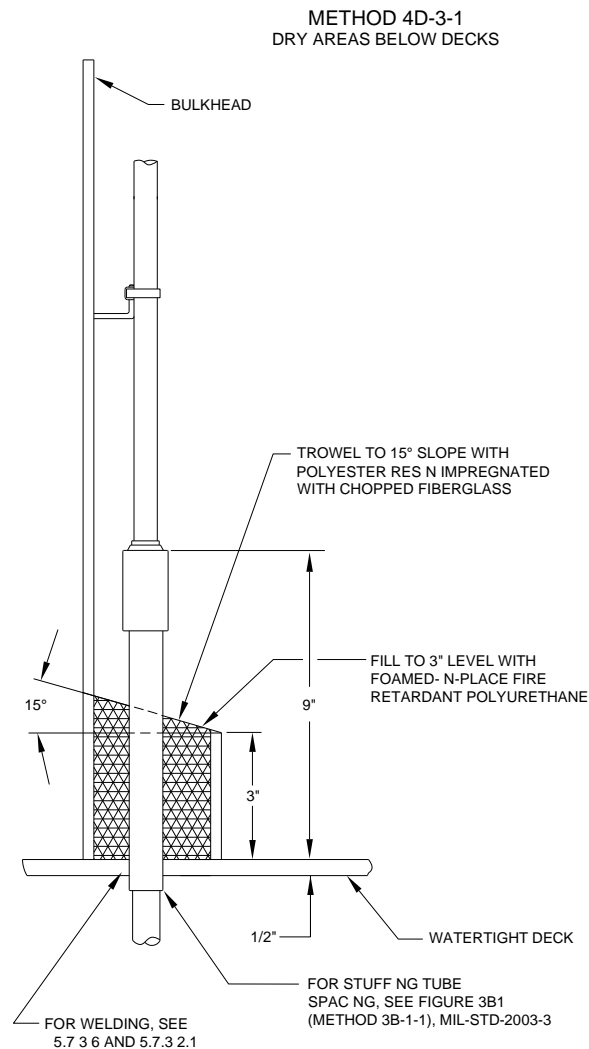

Material	Specification
Polyester resin	MIL-R-21607
Chopped fiberglass	MIL-Y-1140
Fire retardant polyurethane foam	MIL-P-21929

6. These enclosures may be used on steel or aluminum alloy structures using 1/8-inch steel or 1/8-inch aluminum to suit.
7. These enclosures shall not be installed until after all cables are installed and compartments are checked for tightness.
8. A glass-reinforced collar may be used in lieu of a metal collar.

FIGURE 4D2. Protection of cables penetrating watertight decks – wet spaces – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

NOTE: Figures 4D1 through 4D3 provide information for the protection of cables penetrating watertight decks. The length and width of the enclosure shall suit the cable group. The size of the stuffing tube group in decks and bulkheads shall be limited such as to permit re-tightening of all gland nuts in the group by ships force using a stuffing tube wrench set (NSN 5120-00-293-0013), A-A-3041.

NOTES:

1. This method is not for use in weather applications.
2. Collar height shall be 3 inches in dry areas below decks.
3. Surfaces in contact with plastics shall be thoroughly cleaned and free of oil or grease.
4. The finished 15-degree surface shall be smooth.

APPENDIX 4D

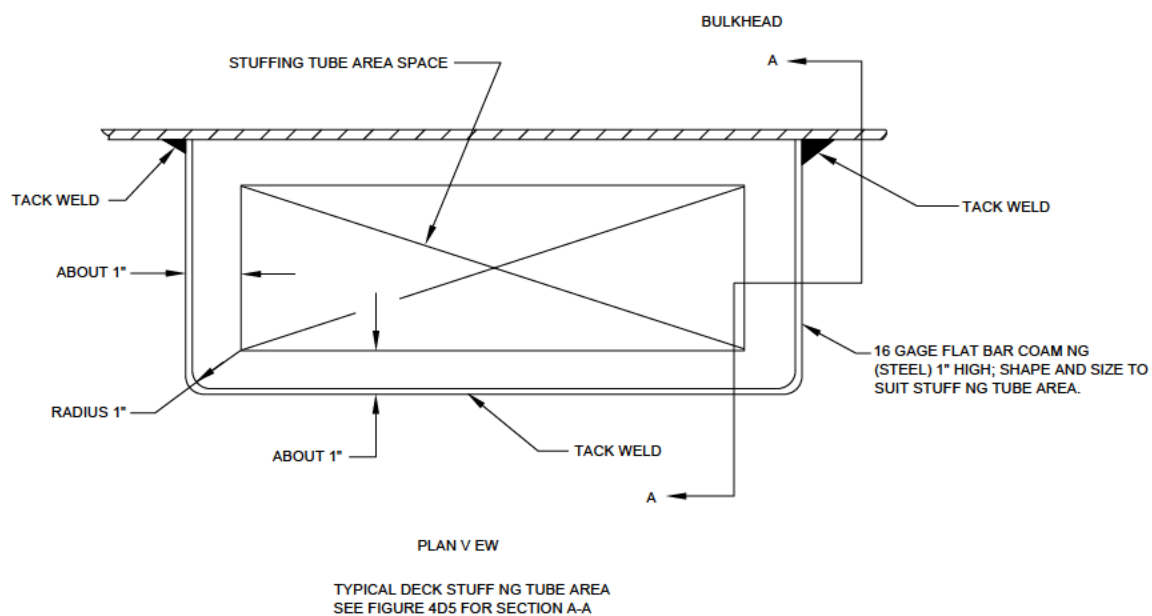

NOTES (continued):

5. Material shall be in accordance with [table 4D2-I](#):
6. These enclosures may be used on steel or aluminum alloy structures using 1/8-inch steel or 1/8-inch aluminum to suit.
7. These enclosures shall not be installed until after all cables are installed and compartments are checked for tightness.
8. A glass-reinforced collar may be used in lieu of a metal collar.

FIGURE 4D3. Protection of cables penetrating watertight decks – dry areas – Continued.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

METHOD 4D-4-1  
ALTERNATE METHOD FOR WATERTIGHT DECKS

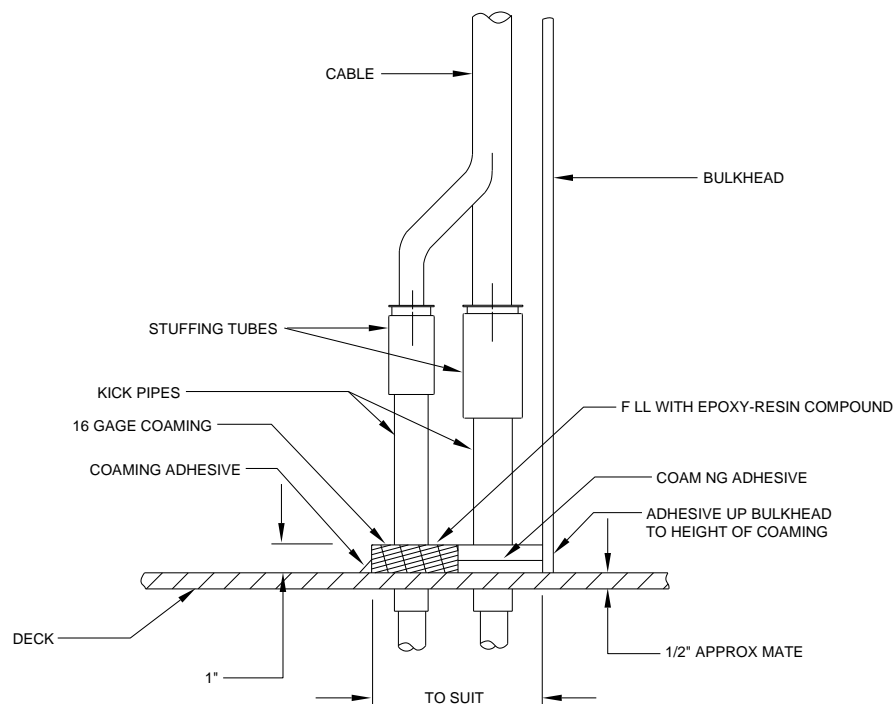

NOTE:

1. See 5.7.3.6 for welding requirements.

FIGURE 4D4. Protection of cables penetrating watertight decks – alternate method.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

SECTION A-A FOR METHOD 4D-4-1  
ALTERNATE METHOD FOR WATERTIGHT DECKS

TYPICAL SECTION A - A

NOTES:

1. [Figures 4D4](#) and [4D5](#) provide an alternate method for protecting cables penetrating watertight decks, and the following procedure applies.
2. For stuffing tube areas other than in the weather, a method using an epoxy compound resin in accordance with MIL-R-17882 on the deck around the kick-pipes shall be accomplished as follows:
  - a. After the kick-pipe and stuffing tubes have been installed and the cables pulled in, the 16-gauge steel coaming shall be fabricated to suit and tack-welded. Where decks have camber/shear, the coaming shall be fabricated to match the slope of the deck so that the epoxy compound will be level with the top edge of the entire coaming. This may necessitate that the coaming be made and tack welded in three separate pieces in lieu of one continuous flat bar as shown in plan view in [figure 4D4](#). The high side of this type of coaming shall not exceed 1½ inches, and the corners shall be rounded.
  - b. The deck around the kick-pipes within the coaming enclosure and the deck around the outside of the coaming shall be thoroughly cleaned as follows (it is not necessary to remove paint):
    - (1) Blow out all dirt and loose material.
    - (2) Scrub with a detergent solution.
    - (3) Rinse with fresh water.
    - (4) Blow out excess water.
  - c. Put adhesive resin in accordance with MIL-R-17882 into a container or on a flat plate. Add adhesive hardener and mix thoroughly until the mixture is ready to be applied. Use adhesive resin manufacturer's instructions for the hardening and application process.

FIGURE 4D5. Protection of cables penetrating watertight decks (alternate method) – section A-A.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

NOTES (continued):

- d. Apply this adhesive “putty” around the outside of the coaming with a rounded-end ¾-inch wide spatula or an equivalent tool and shape the putty to a fillet with the end of the spatula or equivalent tool. Dip the spatula or equivalent tool in water to provide a smooth surface.
  - e. Prepare adhesive resin in accordance MIL-R-17882 per manufacturer’s instructions.
  - f. Pour this mixture into the kick-pipe area enclosure until it begins to overflow the coaming. Wipe excess off outside of coaming. Allow to cure hard before painting.
3. The table below provides approximate cure times for the resin. For temperatures below 60 °F, heat lamps shall be used for curing the epoxy resin. The pot life for the resin is 45 minutes, which means that the epoxy-resin compound should be used within 45 minutes after mixing. Shelf-life of the material before mixing is per manufacturer’s instructions.

Temperature (°F)	Cure time (hours)
85	4
75	8
65	12

4. Local exhaust ventilation is not necessary when using these epoxy materials, however, good personnel hygiene habits should be used and contact with the skin should be avoided. After using the epoxy material, wash with borax soap or waterless skin cleaner. Solvents should be avoided as a skin cleaner, but, if necessary, alcohol should be used (denatured ethyl or isopropyl are preferred). In no case should petroleum solvents or chlorinated hydrocarbons such as gasoline, kerosene, benzene, degreasing solvents, or dry cleaning fluids be used for cleaning the skin.

METHOD 4D-11-2  
CABLE HANGER DETAIL  
FOR SINGLE TIER  
ATTACHMENT TO FRAME OR BULKHEAD

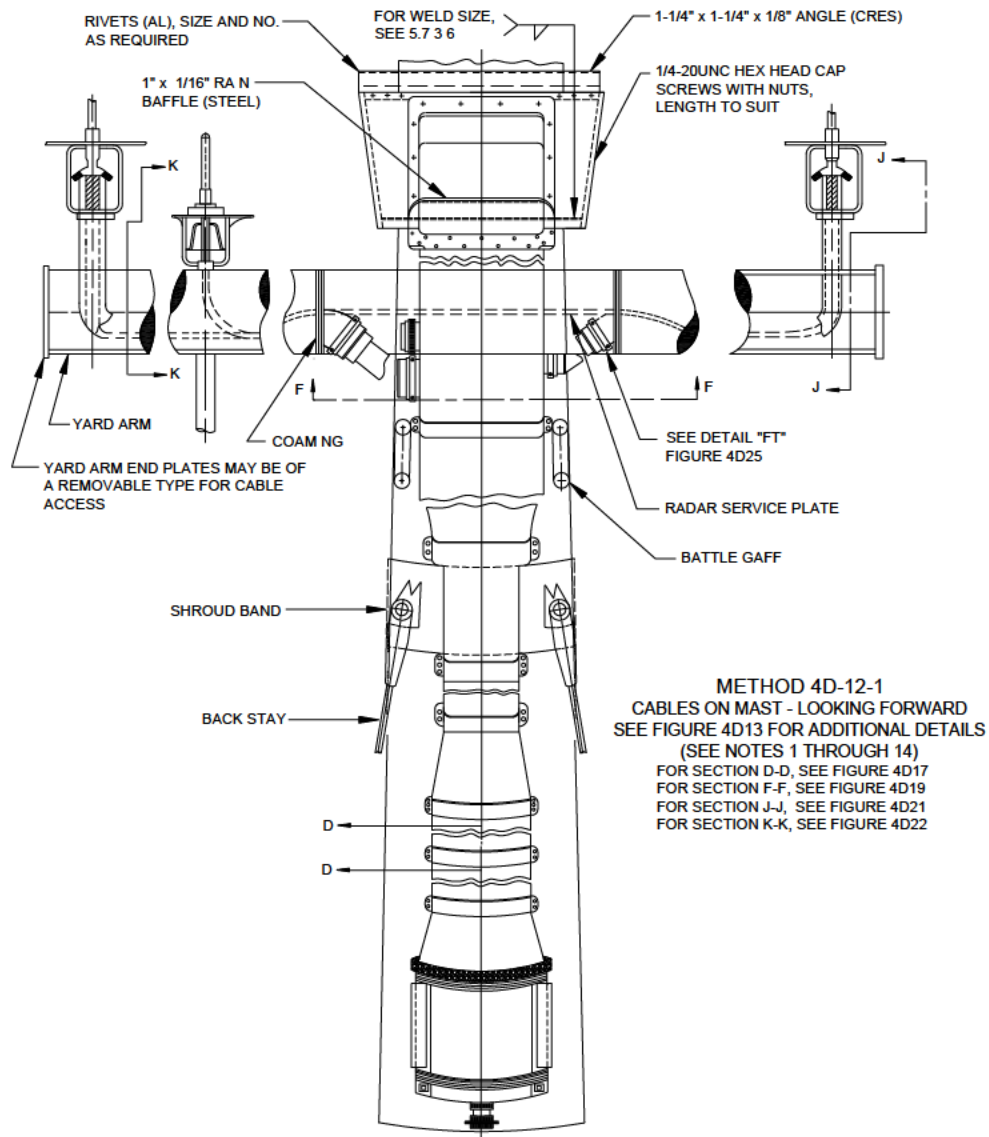

ALL DIMENSIONS ARE IN INCHES

NOTES:

1. See 5.7.3.7 for fastener and fastener material requirements.
2. Welding shall be in accordance with 5.7.3.6.

FIGURE 4D11. Protection of degaussing cables from mechanical injury.

MIL-STD-2003-4B(SH)  
APPENDIX 4D

NOTES:

1. For cables on a surface ship mast, refer to [figures 4D12](#) through [4D26](#).
2. The area of the ventilation duct shall be calculated to give a minimum free flow area of 30 square inches with the closest approach of duct wall to the cable of 1 inch.
3. The minimum distance of hanger support from the insulation to the hanger channel shall be 1 1/2 inches to reduce conduction along hanger.
4. All seams, rivets, and openings in duct wall and insulating material shall be made weathertight.

FIGURE 4D12. Protection of cables on mast (surface ships) – forward view.

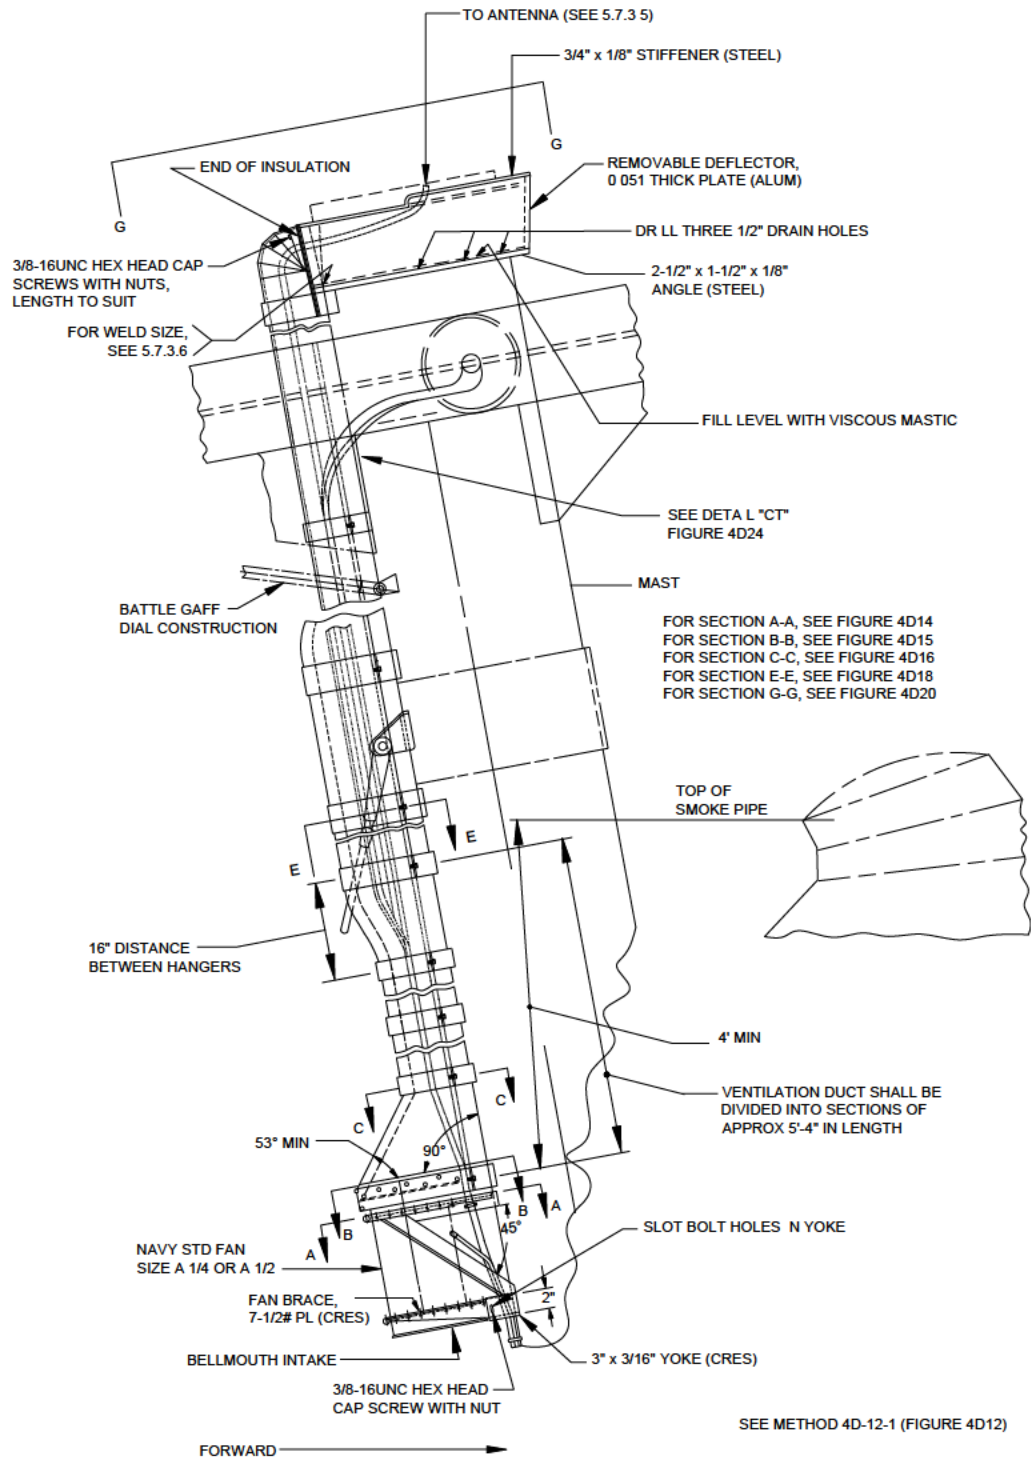

MIL-STD-2003-4B(SH)  
APPENDIX 4D

## NOTES (continued):

5. Provide doubler plates, as necessary, where brackets, coaming, yardarm, etc. are weakened by entrance of the ventilation duct.
6. Faying surfaces of steel and aluminum parts shall receive one coat of primer in accordance with MIL-PRF-23236.
7. After installation, all surfaces of duct shall receive necessary coats of heat-resisting paint to match the surrounding surfaces.
8. In determining the size of duct for new construction, allowance shall be made for several additional cables to accommodate future radar and electrical requirements.
9. For vessels on which the screened speed light is located on the mainmast, the service cable shall be branched from the ventilation duct through flexible tubing.
10. Free flow areas within rain caps and air defectors shall have 1½ to 2 times the area of the feeding pipe.
11. Flexible tubing shall be installed without twist, shall have sufficient slack to prevent the tubing from being strained upon working of mast and yardarms, and with the run pitched to avoid water pockets.
12. Flexible tubing shall be supported at 16-inch intervals where practicable; otherwise at such spacing and location that tubing shall take easy bends. Supports shall not be so placed that the flexing of the tubing will be restrained.
13. To reduce the number of sizes required for star supports, cable grouping may be used with a maximum clearance of ⅜ inch, only as necessary, between star supports and corrosion resisting steel pipe.
14. Star supports shall be prevented from chafing the opposite cable by means of a spreader or steel barrier. The barrier may start longitudinally and twist 90 degrees as it progresses to a point beyond the cable outlet for inboard antenna.
15. See 5.7.3.7 for fastener and fastener material requirements.
