NASA STI Program . . . in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA scientific and technical information (STI) program plays a key part in helping NASA maintain this important role.

The NASA STI program operates under the auspices of the Agency Chief Information Officer. It collects, organizes, provides for archiving, and disseminates NASA's STI. The NASA STI program provides access to the NTRS Registered and its public interface, the NASA Technical Reports Server, thus providing one of the largest collections of aeronautical and space science STI in the world. Results are published in both non-NASA channels and by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA Programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA counter-part of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.
- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services also include organizing and publishing research results, distributing specialized research announcements and feeds, providing information desk and personal search support, and enabling data exchange services.

For more information about the NASA STI program, see the following:

- Access the NASA STI program home page at <http://www.sti.nasa.gov>
- E-mail your question to help@sti.nasa.gov
- Phone the NASA STI Information Desk at 757-864-9658

NTIAC DATA BOOK ERRATA	894

Overview

This data book contains the Directed Design of Experiments for Validating Probability of Detection (POD) Capability of NDE Systems (DOEPOD) analyses of the nondestructive inspection data presented in the NTIAC, Nondestructive Evaluation (NDE) Capabilities Data Book [1]. DOEPOD is designed as a decision support system to validate inspection system, personnel, and protocol demonstrating 0.90 POD with 95% confidence at critical flaw sizes, $a_{90/95}$. Although 0.90 POD with 95% confidence at critical flaw sizes is often stated as an inspection requirement in inspection documents, including NASA Standards [2], NASA critical aerospace applications have historically only accepted 0.978 POD or better with a 95% one-sided lower confidence bound exceeding 0.90 at critical flaw sizes, $a_{90/95}$. (see Figure 11 of [3]).

The test methodology used in DOEPOD is based on the field of statistical sequential analysis founded by Abraham Wald,

“Sequential analysis is a method of statistical inference whose characteristic feature is that the number of observations required by the procedure is not determined in advance of the experiment. The decision to terminate the experiment depends, at each stage, on the results of the observations previously made. A merit of the sequential method, as applied to testing statistical hypotheses, is that test procedures can be constructed which require, on average, a substantially smaller number of observations than equally reliable test procedures based on a predetermined number of observations.” A. Wald [4]

Details of the analysis methods used in DOEPOD are fully described in the DOEPOD [5] manual, and “Directed Design of Experiments for Validating Probability of Detection Capability of a Testing System” US Patent Serial Number: US 8,108,178. Additional details are available on the operation [6] [7] and proof property validation [7] of DOEPOD.

The critical importance of validating methodologies used for establishing POD have been highlighted [3] and this data book provides the DOEPOD validation of POD capabilities for NDE systems, materials, structures, and flaw types presented in the NTIAC, Nondestructive Evaluation (NDE) Capabilities Data Book [1].

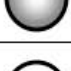

The maximum likelihood estimation (MLE) method used in DOEPOD to estimate the probability of detection using a two parameter logit model (MLE-Logit) are identical to that used in NTIAC [1]. This MLE method was chosen as a verification of data integrity so that the MLE POD plots in NTIAC [1] and this data book are identical except where this data book provides a correction to NTIAC [1] analysis. Corrections to NTIAC [1] are indicated in the Errata listed at the end of this document. Other MLE-Logit methods may be used, and a simple grid search for maximizing parameters has been demonstrated [3] to be effective. The POD analysis methods of NTIAC [1] and a military handbook [8] use a predetermined number of observations.

It is noted here that the MLE-Logit POD curve fit plots shown in this data book and NTIAC [1] are not validated for implementation [3]. Internal and external validation of MLE-Logit POD estimates is required prior to implementation and initial guidance on validation procedures is provide elsewhere [3]. In contrast, if CASE 1, CASE 1+, CASE 1# identifications are identified by DOEPOD analyses of test data, then the system, personnel, and inspection protocol maybe considered for acceptance by engineering authority for implementation application on relevant systems

437 NTIAC data sets are analyzed by DOEPOD to yield a CASE identification for each data set. Possible CASE identifications are listed in Table 1. The reader is referred to the DOEPOD manual [5] for definitions of the parameters in Table 1, and for design of experiment instructions on how to proceed to validate systems and personnel inspection capability. The DOEPOD analysis highlights 72 NTIAC data sets has CASE 1, CASE 1+, or CASE 1# data sets all exhibit 0.978 POD or better with a 95% one-sided lower confidence bound exceeding 0.90 at critical flaw sizes and meet the historical NASA acceptance criteria when actions in Table 1 are addressed.

DOEPOD acronyms are defined at the end of this overview.

Table 1

	Is 90/95 POD at X_{pod} reached? (i.e., lower confidence bound, X_{Best_LCL} , is equal to or greater than 0.9)	DOEPOD Analysis Summary and Recommendations
CASE 1		90/95 POD at X_{pod} has been reached. Actions: Address any false call warnings.
CASE 1+		90/95 POD at X_{pod} has been reached. Actions: Misses above X_{pod} need to be explained and resolved. Address any false call warnings.
CASE 1#		90/95 POD at X_{pod} has been reached. Actions: Further validation at flaw sizes greater than X_{pod} is required. Add large flaws. Address any false call warnings.
CASE 1*		90/95 POD at X_{pod} has been reached. Actions: Further validation at flaw sizes greater than X_{pod} is required. Add large flaws. Misses above X_{pod} need to be explained and resolved. Address any false call warnings.
CASE 2		90/95 POD at X_{pod} has been reached, however, there are an excessive number Misses above X_{pod} . Actions: Additional validation at identified flaw sizes is required. Add flaws per instructions.
CASE 4		90/95 POD at X_{pod} has not been reached. Actions: Increase number of flaws at $X_{POH=1}$ or X_{Best_LCL} .
CASE 5		90/95 POD at X_{pod} has not been reached and there are Misses above X_{Best_LCL} . Actions: Increase the number of flaws at $X_{POH=1}$.
CASE 6		90/95 POD at X_{pod} has not been reached. The POH is fluctuating above X_{Best_LCL} and X_{poh} is greater than $X_i/3$. The inspection system is unstable for the flaw size range analyzed. Actions: Increase the flaw size range by a factor of two.
CASE 7		90/95 POD at X_{pod} has not been reached. The inspection system is unstable for the entire flaw size range analyzed. Actions: The inspection system may not be appropriate or increase the flaw size range by a factor of two.
SURVEY CASES		The optimized class width exceeds $1/3 XL$ and X_{pod} has not been reached. The class width optimization has determined that there is a class width for which the smallest $X_{POH=1}$ class length is identified. Actions: Add flaws at Survey/Optimum X_{POH}

= YES

= NO

Figure 1. Logit-ML Estimated POD at critical flaw size, a90/95, from NTIAC (1997). Open diamonds refer to data sets each having 325 samples. The horizontal dashed line is the NASA minimum binomial estimated POD (0.978) accepted in practice at a flaw size, X_{pod} , for failure critical applications. DOEPOD analyses identified 72 (red disk) data NTIAC data sets that are classified as CASE 1+, or CASE 1# having estimated POD exceeding 0.978 at a flaw size, X_{pod} . Note that X_{pod} and a90/95 are flaw size inspection capability labelling designations for DOEPOD and NTIAC Data Books, respectively. X_{pod} and a90/95 do not necessarily refer to the same flaw size for the same data sets.

A top level summary of the DOEPOD analyses of the nondestructive inspection data presented in the NTIAC Data Book [1] is provide in Table 2. CASE 1+, CASE 1#, CASE 1*, and CASE 2 all exhibit at least one singular point where the one-sided lower 95% confidence bound on POD exceeds 0.90 at a critical flaw size and additional actions are needed per Table 2 instructions to complete the validation over a range of larger flaw sizes. CASE 4 data sets represent data sets that are similar to CASE 2 data sets, however additional data at selected flaws sizes is needed to move a CASE 4 data set to a CASE 2 data set. The CASE 5 data sets have excessive false negatives in the flaw size range tested, therefore data for larger flaw sizes is needed. CASE 6 data sets exhibit local instability over a portion of the flaw sizes tested, therefore, therefore data for larger flaw sizes is needed or the inspection system is inappropriate for the inspection required. CASE 7 data sets exhibit instability over the entire the flaw size range tested, therefore, therefore data for larger flaw sizes is needed or the inspection system is inappropriate for the

inspection required.

Table 2

CASE ID	Number of Data Sets	Action Needed
CASE 1+	2	Explain of observed false negatives
CASE 1#	71	Further validation at larger flaws. Add test specimens with larger flaws.
CASE 1*	80	Further validation at larger flaw. Add test specimens with larger flaws. Explain observed false negatives.
CASE 2	46	Add test specimens at identified flaw sizes to demonstrate POD to be monotonically increasing with flaw size
CASE 4	37	Increase amount of relevant data by adding test specimens at identified flaw sizes to establish acceptable POD
CASE 5	12	Add test specimens with increased flaw sizes to address excessive false negatives at smaller flaw sizes.
CASE 6	91	Add test specimens with flaw sizes at least twice as large to address local inspection system oscillation instability or utilize a different inspection system or method.
CASE 7	98	Add test specimens with flaw sizes at least twice as large to address global inspection system instability or utilize a different inspection system or method.

A summary of the output of parameter values from the DOEPOD analysis of nondestructive inspection data and methods presented in the NTIAC Data Book [1] is listed in Table 3. The descriptions of the parameters in Table 3 are detailed in reference [5]. The data file name is in column 3 of Table 3 and is used to identify the companion DOEPOD analysis output file. The printouts of the DOEPOD analysis output files follow in alphabetic in order to facilitate location. The electronic DOEPOD analysis output files and a searchable summary of parameter values from the DOEPOD analysis (Table 3) are available in the companion CD-ROM entitled “NASA DOEPOD Nondestructive Evaluation (NDE) Capabilities Data Book” which may be obtained upon request from the publisher.

DOEPOD software is available from NASA by contacting Kathy A. Dezern, phone: 757.864.5704, email: kathy.a.dezern@nasa.gov

Example

As an illustrative example we examine the first data set A1001AL. The multi-parameter maximum likelihood analysis in the NTIAC NDE Capabilities Data Book indicates the inspection system to have a 0.94 POD with lower single-sided 95% confidence bound that exceeds 0.9 at 0.27" flaw size (column labeled "NTIAC 90/95 occurs at POD (inch)"). In contrast, the NASA DOEPOD point estimate based method (no curve fitting) indicates that the acceptable capability of this inspection system is at or above the 0.61" flaws size (column labeled Xpod CLASSLENGTH) where 1.0 POD is estimated (column labeled POH or POD @Xpod) with a single-sided lower 95% confidence bound that exceeds 0.9 at 0.61" flaw size.

Examining the data analyses for A1001AL (page 20). There are five Misses (Xs) for the 72 flaws larger than the 0.27" flaw size yielding a 0.93 point estimate of POD for these grouped larger flaws with a single-sided lower 95% confidence bound of 0.83. The multi-parameter POD curve fit does not highlight these Misses as important. DOEPOD indicates that the POD capability for this system and for fracture critical inspections is at or above the 0.61" flaw size. Even then, DOEPOD analysis indicates [RED notes in chart] that additional large flaw data is needed to complete the validation before accepting the 0.61" flaw size capability of this inspection system, and that false call analysis is also required.

Accepting the 0.27" flaw size identified by multi-parameter maximum likelihood method as the detection capability of this inspection system for fracture critical inspections adds known risk as highlighted by the 0.93 point estimate of POD with a single-sided lower bound of 0.83 for the largest flaws. DOEPOD analysis indicates that the POD capability for this system and for fracture critical inspections is at or above the 0.61" flaw size.

DOEPOD DEFINITIONS

C_L	Class length, e.g., inspection parameter (length, depth, area, etc.)
C_W	Class width (width of the moving class; all flaws within the range C_L to $C_L + C_W$, inclusively, are group together)
Hit	Flaw is detected
Miss	Flaw is not detected
MLE	Maximum Likelihood Estimate of POD using a two parameter statistical model. The MLE is included in DOEPOD as a user request for comparison. <i>The included method is that of the NDE Capabilities Data Book, 3rd ed., Nov. 1997, NTIAC DB-97-02, DoD. The use of MLE estimated POD is not recommend unless a full validation of the estimated POD is performed (see Generazio, E. R., Interrelationships Between Receiver/Relative Operating Characteristics Display, Binomial, Logit, and Bayes' Rule Probability of Detection Methodologies, NASA-TM-2014-21818, April 2014.</i>
Need	Add new samples to the existing specimen set in order to reach the number of samples required at the class length. Note that a single specimen may contain more than one flaw, so that "add samples" refers to "add flaws".
LCL	Lower confidence bound (value) of POH @ 95% confidence
Opt. X_{POH}	Optimum X_{POH} is identified for non-survey data sets. Optimum X_{POH} is the smallest class length and largest class width at which the minimum $X_{POH} = 1$ occurs. Optimum X_{POH} may be more aggressive than optional, X_{PODopt} , or $X_{Best\ LCL}$, when the class width is constrained to the companion Optimum X_{POH} class width listed. DOEPOD does not force use of Optimum X_{POH} over X_{PODopt} , or $X_{Best\ LCL}$. Stability has not been demonstrated at Optimum X_{POH} , therefore there is an additional risk that Optimum X_{POH} can not be satisfied to reach X_{POD}
POH	Estimate of Probability of Hit (Number of Hits in Class Length/Total Number of Trials in Class Length)
POD	Probability of Detection (the true POD obtained if an infinite number of samples are used)
Signal Amplitude	Scalar amplitude output of NDE inspection system

Survey Data Sets	Survey Data Sets are data sets that have a sparse or disperse collection of samples. The moving class width optimization has identified this data set as having limited applications where the classwidth has exceeded $X_L/3$ <u>and</u> X_{POD} has not been reached. An alternate optimization of X_{POH} is used to provide guidance. The Survey Set is the recommended initial set for DOEPOD.
Survey X_{POH}	Survey X_{POH} is only identified for data sets determined to be Survey Data Sets. Survey X_{POH} is the smallest class length and largest class width at which the minimum $X_{POH} = 1$ class length occurs. Survey X_{POH} is the minimum class length at which X_{POD} may be achieved when the class width is constrained to the companion survey class width listed. Survey X_{POH} is utilized in all cases in which a Survey Set is identified by DOEPOD.
$X_{Best\ LCL}$	Class length exhibiting the maximum or “best” LCL. The best class length is determined by increasing the moving class width until a maximum LCL is obtained
X_i	Class length X at point “i”
X_L	Largest class length in entire data set
X_m	Class length near the mid-point between the largest and the smallest class lengths having no Misses
X_p	90/95 POD or greater is achieve, by grouping numbers of specimens, for the range X_p to X_L . X_p is only provided when X_{POD} has been identified. For inspector qualification, X_p cannot be less than the largest flaw Missed. The class width of flaw set used for inspector qualification is listed as Inspector Classwidth @ X_p in the charts. The flaw sizes used for inspector qualification range from X_p to (X_p - Classwidth @ X_p).
X_{POD}	Class length at which the lower confidence bound (value) is 0.90 (90/95 POD) @ 95% confidence.
$X_{POH=1}, X_{POH}$	Class length where there are no Misses above this class length, and $POH = 1$ above this class length.
X_{PODopt}	Optional existing smaller class length where X_{POD} may also be achieved if additional samples are added and Hits are identified.
X_S	Smallest class length in the data set
UCL	Upper confidence bound (value) of the false call rate @ 95% confidence

****Validated** 90/95 POD has been reached at a classlength, X_{POD} . In order to achieve 90/95 POD for the class length range between X_{POD} and the largest class length in the data set, X_L , inclusively, validation at a classlength near the mid-point and largest classlength is required^ξ. If, in addition, there exists a class length, X_P , where 90/95 POD or greater exists for all class lengths in the range X_P to X_L , and $X_P = X_{\text{POD}}$, and there is a sufficient number and adequate range and distribution of classlengths greater than X_{POD} , then the validation extends from X_{POD} to X_L . When this occurs, validation at a classlength near the mid-point and largest classlength is satisfied. ^ξ**WARNING:** There are inspection systems that exhibit an oscillating or non-uniform POD. For example when the flaws are greater than the eddy current footprint, when large flaws are loaded to closure, or when the physics of the inspection processes changes modes over the flaw size range of interest. If flaws in these ranges or conditions are to be detected with a 90/95 POD, then samples in these ranges need to be included. When multiple base parameters are combined, e.g., (length)x(width) = area, and the combine parameter (e.g., area) is used as the class length, then 90/95 POD is only valid if the inspection technology has been validated to quantitatively measure each of the base parameters, or if the inspection technology is validated to quantitatively measure the new combine parameter. When all CASE 1 or CASE 1+ requirements are met, and the above warnings have been evaluated and the upper confidence bound of the false call rate is not excessive, then the inspection system is validated between X_{POD} and the largest class length X_L for the flaw types, materials, and structure of the test specimen set. Validated is defined here to be: “This confidence bound procedure has a probability of at least 0.95 to give a lower bound for the 90% POD point that exceeds true (unknown) 90% POD point. This is referred to as 90/95 POD, and for larger flaws in the evaluation range 90/95 POD is met or exceeded. DOEPOD SOFTWARE AND ANY ACCOMPANYING DOCUMENTATION IS RELEASED "AS IS". TABLE A*

Selected class lengths with existing misses. Each point requires additional samples in or to achieve the Xpod listed.

TABLE B*

Selected class lengths with no misses. Additional samples at these class lengths will achieve the Xpod listed.

Xpod, Class Length	No. Need	Xpod, Class Length	No. Need
--------------------	----------	--------------------	----------

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked.
The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.
The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown.
Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

Xpod, Class Length	No. Need	Xpod, Class Length	No. Need
--------------------	----------	--------------------	----------

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked. The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown. Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

TABLE A*
Selected class lengths with existing misses. Each point requires additional samples in or to achieve the Xpod listed.

TABLE B*
Selected class lengths with no misses. Additional samples at these class lengths will achieve the Xpod listed.

Xpod, Class Length	No. Need	Xpod, Class Length	No. Need

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked.
The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.
The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown.
Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

TABLE A*

Selected class lengths with existing misses. Each point requires additional samples in or to achieve the Xpod listed.

TABLE B*

Selected class lengths with no misses. Additional samples at these class lengths will achieve the Xpod listed.

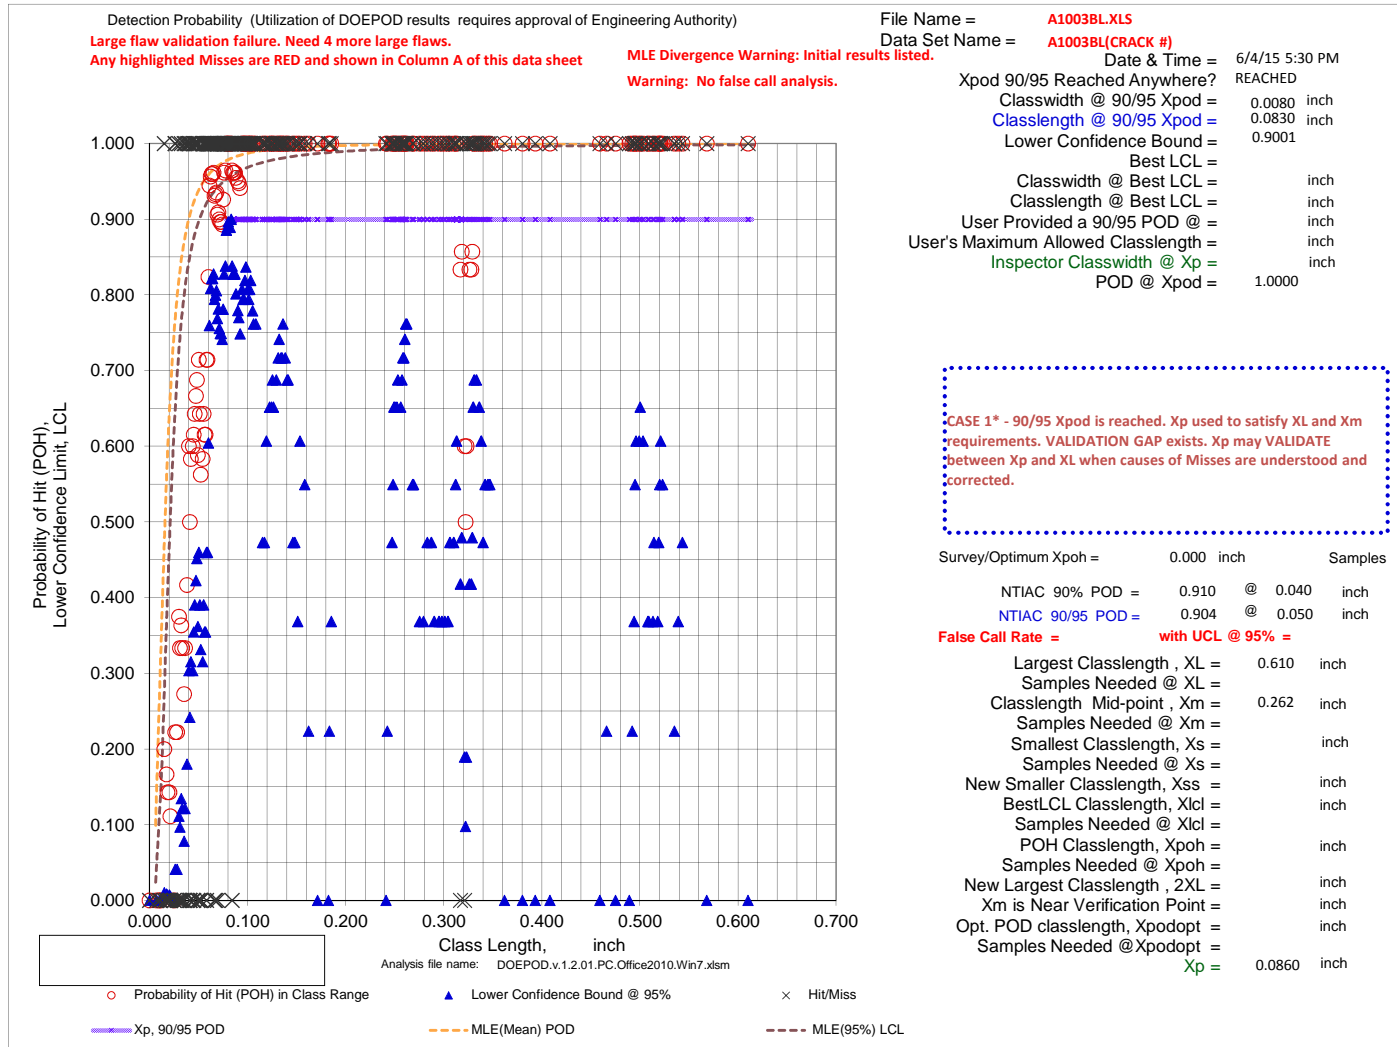

Xpod, Class Length	No. Need	Xpod, Class Length	No. Need

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked. The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

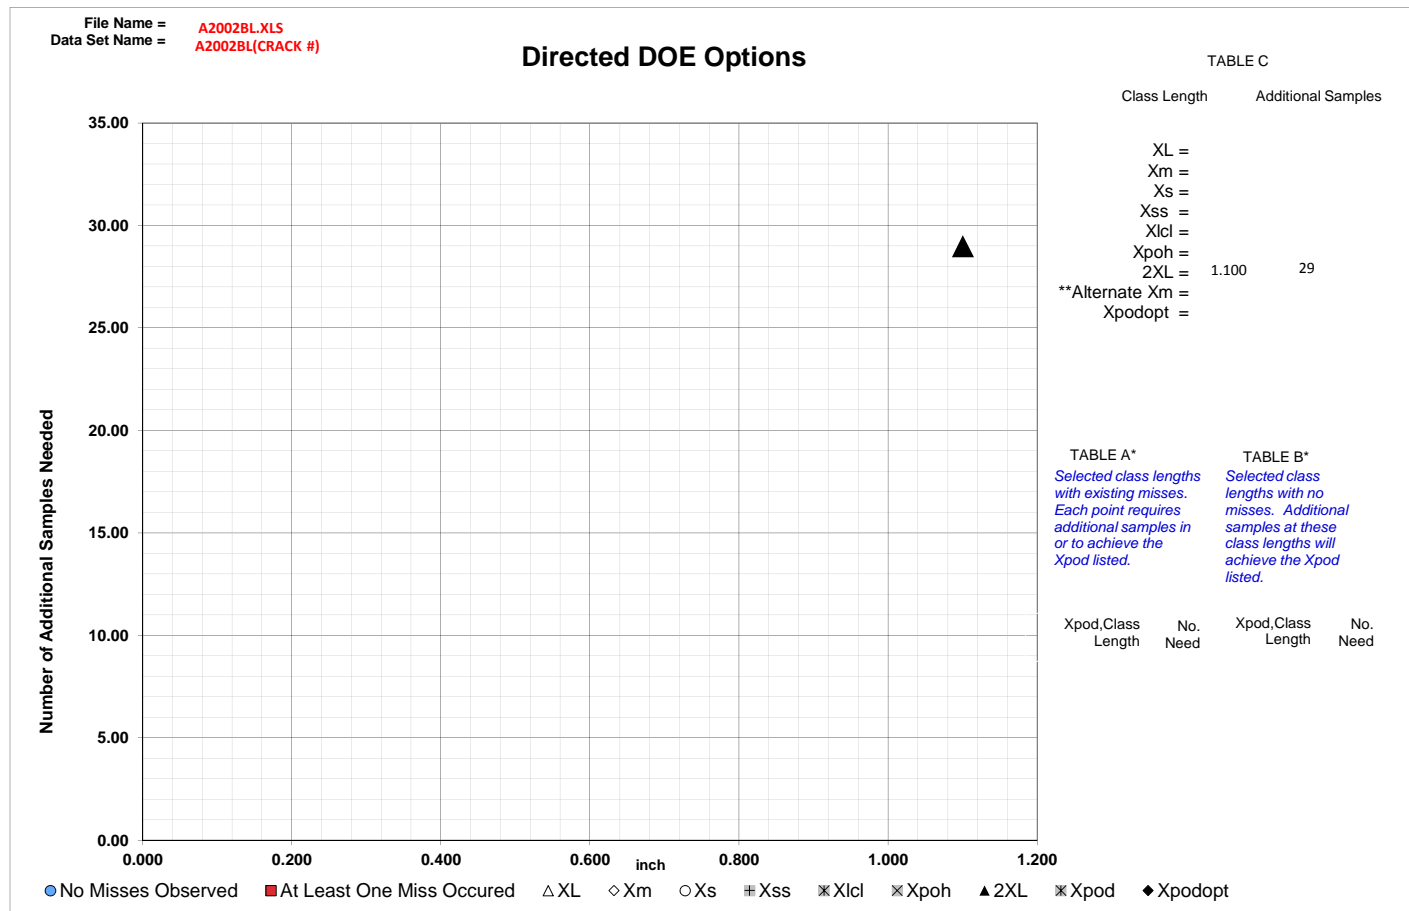

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown. Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

Selected class lengths with no misses. Additional samples at these class lengths will achieve the Xpod listed.

Xpod, Class Length	No. Need	Xpod, Class Length	No. Need
--------------------	----------	--------------------	----------

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked.
The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown.
Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

Xpod,Class Length	No. Need	Xpod,Class Length	No. Need

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked. The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown. Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

1.1880	43		
0.9950	34		
0.9900	37		
0.5400	70	0.9810	26

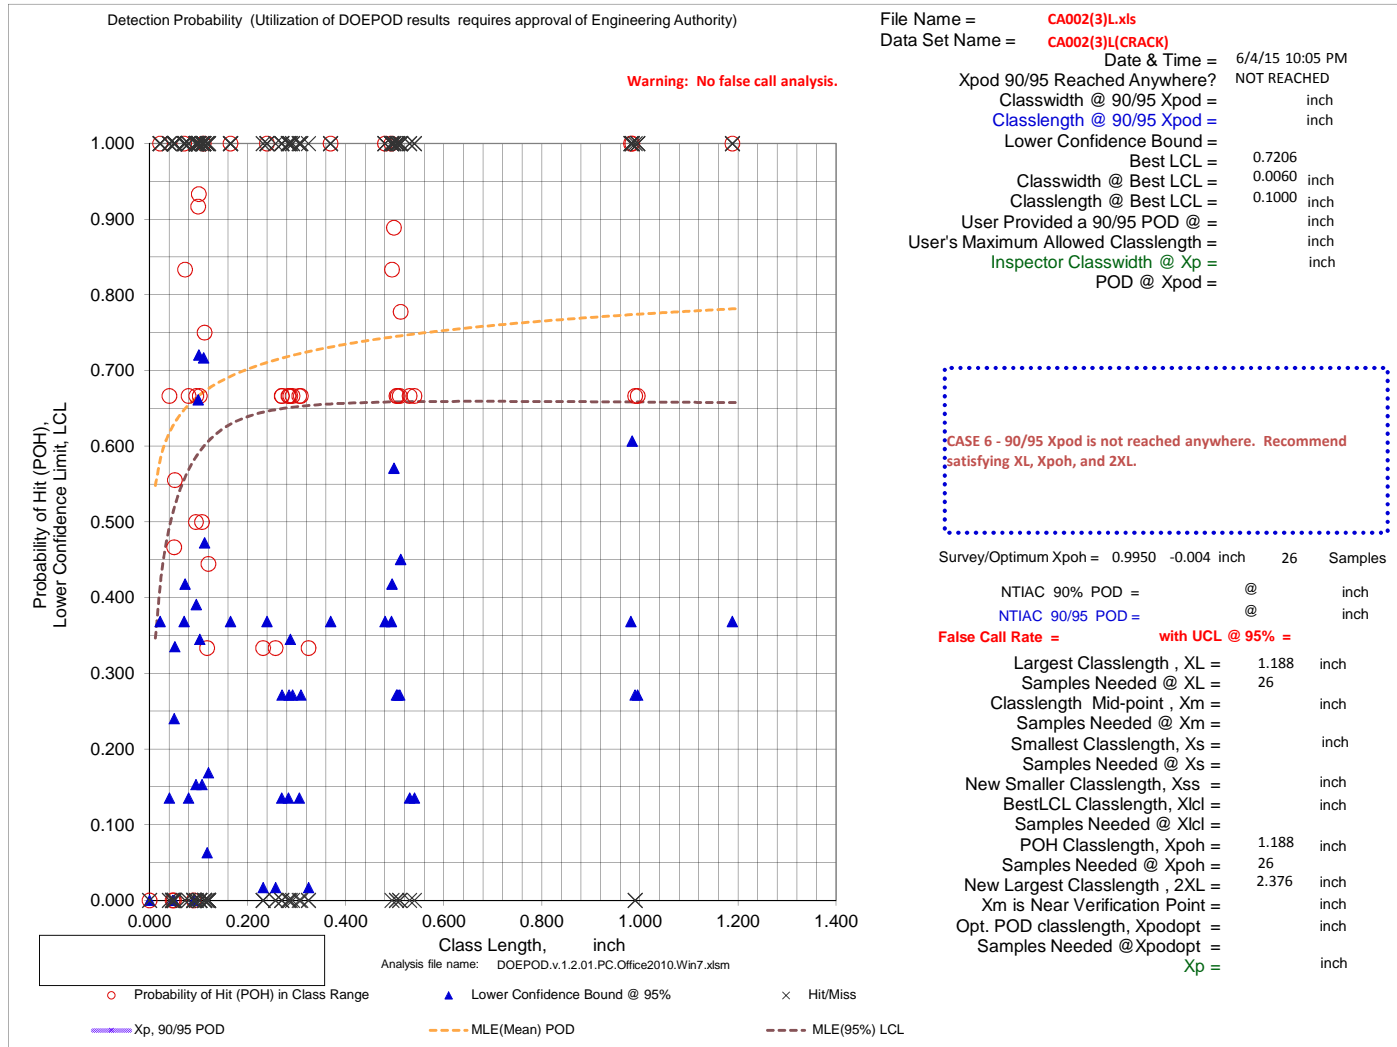

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked. The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

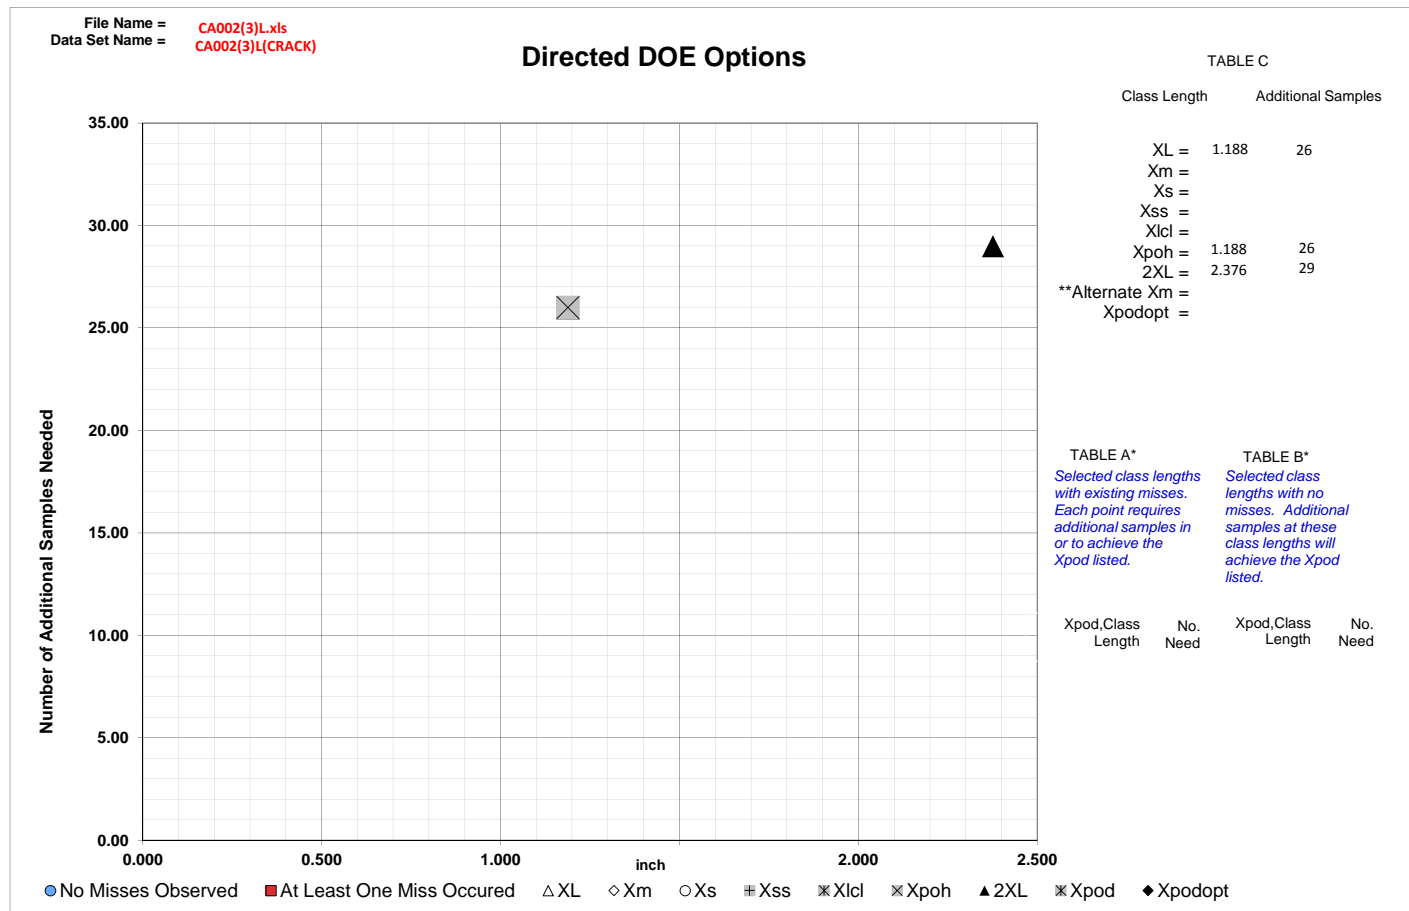

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown. Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

TABLE A*

Selected class lengths with existing misses. Each point requires additional samples in or to achieve the Xpod listed.

TABLE B*

Selected class lengths with no misses. Additional samples at these class lengths will achieve the Xpod listed.

Xpod,Class Length	No. Need	Xpod,Class Length	No. Need
-------------------	----------	-------------------	----------

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked. The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown. Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

TABLE A*
Selected class lengths with existing misses. Each point requires additional samples in or to achieve the Xpod listed.

TABLE B*
Selected class lengths with no misses. Additional samples at these class lengths will achieve the Xpod listed.

Xpod, Class Length	No. Need	Xpod, Class Length	No. Need

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked.
The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown.
Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

Selected class lengths with no misses. Additional samples at these class lengths will achieve the Xpod listed.

Xpod,Class Length	No. Need	Xpod,Class Length	No. Need
-------------------	----------	-------------------	----------

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked. The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown. Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

Selected class lengths with no misses. Additional samples at these class lengths will achieve the Xpod listed.

Xpod,Class Length	No. Need	Xpod,Class Length	No. Need

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked.
The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.
The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown.
Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

Xpod,Class Length	No. Need	Xpod,Class Length	No. Need
-------------------	----------	-------------------	----------

* Although Xpod appears to have been reached at a point, there are Misses at larger class lengths this indicates that the POH function may be oscillatory. This needs to be checked. The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown. Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

The class lengths listed in Table A exhibited misses and resulted in LCL below 0.90. Only largest 4 class lengths are shown.

The class lengths listed in Table B exhibited no misses, and these class lengths provide alternate target Xpod points. Only largest 4 class lengths are shown. Follow sample selection priority in the DOEPOD Manual.

Before adding flawed samples to satisfy elements of Table A or Table B, it is recommended that the cause of the Misses be determined (human factors, unexpected flaw type, etc) and resolved first.

**Satisfying the Alternate Xm requirement removes the need to meet the adjacent Xm requirement.

***The added class lengths are to be at the class length indicated or smaller to within the class width indicated in the companion chart

DATA Analysis integrity:

During validation of DOEPOD results on the entire NTIAC NDE Capabilities Book "DOEPOD(NTIAC)", some exceptions were noted in the results. There are 437 data sets and exceptions were identified in the 32 data sets listed below. The analysis results shown in the NTIAC NDE Capabilities Book, 3rd Edition (1997) [NTIAC: DB-97-02] for the data sets listed below are incorrect due to a data listing error. These data sets need to be re-run with data sorted.

 G10003BL.XLS

OTHER:

C8003(3)L.xls - sample #136 shows 3 trials with -1 in the HIT/MISS column
 C8003(3)D.xls - sample #136 shows 3 trials with -1 in the HIT/MISS column

C3002: Sample #16 shows 0.10" in depth. NASA CR 151098 pg 27. shows 0.010". Since the sample thickness is 0.063" this NTIAC entry is incorrect.

The primary and secondary scales on abscissa axes in Chart 1 may be incorrect. Compare actual flaw sizes and inspection data on data sheets available in electronic distributions.

REPORT DOCUMENTATION PAGE					Form Approved OMB No. 0704-0188	
<p>The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.</p> <p>PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.</p>

13. SUPPLEMENTARY NOTES						
14. ABSTRACT This data book contains the Directed Design of Experiments for Validating Probability of Detection (POD) Capability of NDE Systems (DOEPOD) analyses of the nondestructive inspection data presented in the NTIAC, Nondestructive Evaluation (NDE) Capabilities Data Book, 3rd ed., NTIAC DB-97-02. DOEPOD is designed as a decision support system to validate inspection system, personnel, and protocol demonstrating 0.90 POD with 95% confidence at critical flaw sizes, a90/95. The test methodology used in DOEPOD is based on the field of statistical sequential analysis founded by Abraham Wald, "Sequential analysis is a method of statistical inference whose characteristic feature is that the number of observations required by the procedure is not determined in advance of the experiment. The decision to terminate the experiment depends, at each stage, on the results of the observations previously made. A merit of the sequential method, as applied to testing statistical hypotheses, is that test procedures can be constructed which require, on average, a substantially smaller number of observations than equally reliable test procedures based on a predetermined number of observations." A. Wald, 1947.						
15. SUBJECT TERMS Defects; Flaws; Maximum destructive likelihood; Nondestructive evaluation; Probability of detection
