ADDENDUM 1

GENERAL SPECIFICATION
VACUUM STABILITY REQUIREMENTS OF POLYMERIC
MATERIAL FOR SPACECRAFT APPLICATION

MAY 16, 1983

THE PURPOSE OF THIS ADDENDUM IS TO ALLOW ADDITIONAL METHODS OF APPROVING HARDWARE FOR FLIGHT, AND TO CORRECT A DOCUMENT REFERENCE.

PAGE 1, PARAGRAPH 4.0. IN THE LAST SENTENCE OF THE FIRST PARAGRAPH, DELETE, "(JSC 08962A)" AND ADD (JSC 08962) IN LIEU THEREOF.

PAGE 2, PARAGRAPH 4.0 ADD A NEW SUBPARAGRAPH "G" AS FOLLOWS:

- G. A HARDWARE ITEM (I.E., COMPONENT, ASSEMBLY, ETC.) CONTAINING MATERIALS THAT FAIL THE VCM REQUIREMENT AND/OR HAVING UNIDENTIFIED MATERIALS, MAY BE VACUUM BAKED UNTIL IT HAS AN ACCEPTABLE OUTGASSING LEVEL. THE THERMAL VACUUM CHAMBER USED FOR VACUUM BAKING MUST HAVE INSTRUMENTATION SUCH AS QCM OR MASS SPECTROMETERS, TO DETERMINE WHEN THE HARDWARE ITEM IS ACCEPTABLE. THE THERMAL VACUUM CHAMBER CAPABILITY, BAKING PROCEDURE AND ACCEPTANCE CRITERIA MUST BE APPROVED BY JSC MATERIALS BRANCH (ES5). THE JSC WHITE SANDS TEST FACILITY (WSTF) HAS THE FACILITIES AND THE CAPABILITY TO PERFORM SUCH VACUUM BAKING.

1.0 PURPOSE

The purpose of this document is to establish outgassing requirements and test guidelines for polymeric materials used in the space thermal/vacuum environment around sensitive optical or thermal control surfaces.

2.0 REQUIREMENTS

The control and verification of material outgassing to the guidelines of this document are based on the following requirements:

- a. The polymeric materials used in the thermal/vacuum environment shall not contaminate the sensitive surfaces within an assembly.
- b. The polymeric materials used in any application shall not affect the sensitive surfaces of any adjacent equipment.

The material shall have a maximum total mass loss (TML) of 1.0 percent of the original specimen mass and a maximum volatile condensable material (VCM) content of 0.1 percent of the original specimen mass when tested in accordance with the test procedure in paragraph 6.

3.0 SCOPE

The scope of this document covers the control of polymeric materials used near or adjacent to optical or thermal control surfaces that are exposed to the thermal/vacuum environment of space. This document establishes the requirements and defines the test method to evaluate polymeric materials used in the vicinity of these surfaces in space applications.

4.0 SELECTION AND VERIFICATION REQUIREMENTS

Use of polymeric material near optical or thermal control surfaces shall be restricted to those materials which have a maximum volatile condensable material content of 0.1 percent and a total mass loss of 1.0 percent or less when tested in accordance with the test method described in paragraph 6. NASA JSC will provide to the contractor(s) a list of approved materials for use in the thermal/vacuum environment upon request. NASA JSC also maintains a complete file (JSC 08962A) of all materials tested.

The use of materials that have been tested but failed the requirements of this specification may be allowed if the contractor can provide rationale for their use that is approved

by NASA JSC. The following are examples of some considerations for use as rationale for a material that has failed the VCM or mass loss requirements:

- a. The material may be brought within vacuum stability limits by vacuum baking for a specified period of time (usually 48 hours at maximum use temperature at a pressure of less than 10^{-6} torr).
- b. If material cannot be vacuum baked and its exposed area is 13 cm^2 or less, and the material is out of line-of-sight of payload surfaces and other contamination critical surfaces, total mass loss may be up to 3.0% and volatile condensable material up to 1.0%.
- c. If total mass loss is greater than 1.0% and $\text{VCM} \leq 0.1\%$ and it can be shown that contributions to TML greater than 1.0% are due to sorbed water vapor, the material may be used.
- d. The material is the only satisfactory choice from a functionality viewpoint for the particular application.
- e. The total mass of materials selected under 4b and 4d above and used in any given compartment will be monitored and reviewed periodically to insure that compartmental peculiar problems do not evolve.
- f. Materials previously tested and found acceptable per MSC 50H02442 may be used.

5.0 IMPLEMENTATION

The contractor shall provide for NASA JSC approval, a list of all polymeric materials selected for use around sensitive surfaces or in the same defined compartment as optical or thermal control surfaces. The following information is required.

- a. Manufacturer's trade name
- b. Manufacturer of the material
- c. Thermal vacuum stability (VCM and TML) data
- d. Rationale for use of material that failed the requirements of paragraph 4.0 and a report of the weight and surface area used.
- e. Materials that have not been tested should be submitted to JSC/ES5 for testing utilizing JSC form 2035B.

6.0 TEST PROCEDURES

6.1 PURPOSE. The purpose of this test is to measure total mass loss and volatile condensable material content of polymeric materials under controlled laboratory conditions. The following test procedure outlined below was extracted from NASA White Sands Test Facility Operational Checkout Procedure 200-013 entitled "Determination of Weight Loss and Volatile Condensable Components of Polymeric Material", June 1974. The use of any other test equipment and/or procedure must be approved by NASA-JSC.

6.2 TEST CONDITIONS. The test on polymeric materials shall be conducted under the following conditions:

Pressure	10 ⁻⁶ torr or less
Temperature of specimen	125°C ± 1°C
Temperature of condensable plates	25°C ± 1°C
Vacuum exposure time	24 hours

6.3 CRITERIA OF ACCEPTABILITY. The material shall have a volatile condensable material content of less than 0.1 percent of the original mass of the specimen. The total mass loss of the material shall not exceed 1.0 percent of the original mass of the specimen.

6.4 TEST EQUIPMENT. All laboratory test instrumentation shall be in current calibration and shall reflect appropriate documentation from the applicable calibration laboratory. The test equipment shall consist of the following:

- a. A vacuum system capable of maintaining 10⁻⁶ torr for a period of 24 hours.
- b. Specimen holder made of stainless steel or aluminum. The specimen holder shall be nominally 3.8 cm long and 1.25 cm in diameter.
- c. Collector plate shall be made of a highly polished stable metal surface. The collector plate shall be 3.8 cm in diameter.
- d. The test apparatus shall be made of copper. The apparatus shall be such that multiple specimen holders and collector plates can be accommodated at one time. The sample section shall be capable of maintaining the samples at 125 ± 1°C and maintaining the collector plates at 25 ± 1°C.

6.5 SAMPLE PREPARATION.

- 6.5.1 Specimen Size. Materials to be tested shall be prepared in 100 to 300 milligram specimen sizes and placed in stainless steel or aluminum holders after preparation as specified below.
- 6.5.2 Solid Materials. Specimens shall be cut into small pieces having 0.15 cm maximum dimension. Samples shall be placed in a desiccator after preparation and remain there until the samples are placed in the test chamber.
- 6.5.3 Coatings. Materials that are normally used as coatings shall be applied to aluminum foil or Teflon sheet and prepared as noted in paragraph 6.5.2.
- 6.5.4 Solvent Containing Materials. Prior to testing solvent containing materials, such as inks and paints or room temperature cured materials, the sample shall be preconditioned for 24 hours at $65 \pm 1^\circ\text{C}$ in an air circulating oven to simulate the material exposure up to the time of launch.
- 6.5.5 Tapes. Tapes shall be tested in the as-applied configuration using aluminum foil or Teflon sheet as an application substrate and prepared in accordance with paragraph 6.5.2.
- 6.5.6 Liquids. Liquids shall be tested in the as-received state.
- 6.5.7 Cure Procedures. All material shall be cured or applied in accordance with the manufacturer's procedures or the applicable contractor process specification prior to test.

6.6 THL AND VCM MEASUREMENT.

- 6.6.1 Initial Mass Determination. The VCM collector plate and specimen holder mass shall be measured. Specimens shall be tested and their mass measured after being desiccated for 24 hours.
- 6.6.2 Specimen Insertion. The weighed samples shall be placed in the compartments of the heating block and the VCM collector plates shall be fastened to the cooling block of the apparatus.
- 6.6.3 Pressure. The system shall be evacuated and held at a maximum pressure of 10^{-6} torr.

- 6.6.4 Application of Heat. When the unit has reached 10^{-6} torr, the specimens shall be heated to $125^{\circ}\text{C} \pm 1^{\circ}\text{C}$, and maintained for 24 hours. The VCM collector plates shall be maintained at $25^{\circ}\text{C} \pm 1^{\circ}\text{C}$ during the test.
- 6.6.5 Specimen Removal. The specimens in their holders and the VCM collector plates shall be removed from the apparatus and immediately placed in a desiccator.
- 6.6.6 Final Mass Determination. Measure the mass of the specimens and the collector plates as soon as possible after removal from the VCM apparatus, and record.

1.0 PURPOSE

The purpose of this document is to establish outgassing requirements and test guidelines for polymeric materials used in the space thermal/vacuum environment around sensitive optical or thermal control surfaces.

2.0 REQUIREMENTS

The control and verification of material outgassing to the guidelines of this document are based on the following requirements:

- a. The polymeric materials used in the thermal/vacuum environment shall not contaminate the sensitive surfaces within an assembly.
- b. The polymeric materials used in any application shall not affect the sensitive surfaces of any adjacent equipment.

The material shall have a maximum total mass loss (TML) of 1.0 percent of the original specimen mass and a maximum volatile condensable material (VCM) content of 0.1 percent of the original specimen mass when tested in accordance with the test procedure in paragraph 6.

3.0 SCOPE

The scope of this document covers the control of polymeric materials used near or adjacent to optical or thermal control surfaces that are exposed to the thermal/vacuum environment of space. This document establishes the requirements and defines the test method to evaluate polymeric materials used in the vicinity of these surfaces in space applications.

4.0 SELECTION AND VERIFICATION REQUIREMENTS

Use of polymeric material near optical or thermal control surfaces shall be restricted to those materials which have a maximum volatile condensable material content of 0.1 percent and a total mass loss of 1.0 percent or less when tested in accordance with the test method described in paragraph 6. NASA JSC will provide to the contractor(s) a list of approved materials for use in the thermal/vacuum environment upon request. NASA JSC also maintains a complete file (JSC 08962A) of all materials tested.

The use of materials that have been tested but failed the requirements of this specification may be allowed if the contractor can provide rationale for their use that is approved

by NASA JSC. The following are examples of some considerations for use as rationale for a material that has failed the VCM or mass loss requirements:

- a. The material may be brought within vacuum stability limits by vacuum baking for a specified period of time (usually 48 hours at maximum use temperature at a pressure of less than 10^{-6} torr).
- b. If material cannot be vacuum baked and its exposed area is 13 cm² or less, and the material is out of line-of-sight of payload surfaces and other contamination critical surfaces, total mass loss may be up to 3.0% and volatile condensable material up to 1.0%.
- c. If total mass loss is greater than 1.0% and VCM \leq 0.1% and it can be shown that contributions to TML greater than 1.0% are due to sorbed water vapor, the material may be used.
- d. The material is the only satisfactory choice from a functionality viewpoint for the particular application.
- e. The total mass of materials selected under 4b and 4d above and used in any given compartment will be monitored and reviewed periodically to insure that compartmental peculiar problems do not evolve.
- f. Materials previously tested and found acceptable per MSFC 50M02442 may be used.

5.0 IMPLEMENTATION

The contractor shall provide for NASA JSC approval, a list of all polymeric materials selected for use around sensitive surfaces or in the same defined compartment as optical or thermal control surfaces. The following information is required.

- a. Manufacturer's trade name
- b. Manufacturer of the material
- c. Thermal vacuum stability (VCM and TML) data
- d. Rationale for use of material that failed the requirements of paragraph 4.0 and a report of the weight and surface area used.
- e. Materials that have not been tested should be submitted to JSC/ES5 for testing utilizing JSC form 2035B.

6.0 TEST PROCEDURES

6.1 PURPOSE. The purpose of this test is to measure total mass loss and volatile condensable material content of polymeric materials under controlled laboratory conditions. The following test procedure outlined below was extracted from NASA White Sands Test Facility Operational Checkout Procedure 200-013 entitled "Determination of Weight Loss and Volatile Condensable Components of Polymeric Material", June 1974. The use of any other test equipment and/or procedure must be approved by NASA-JSC.

6.2 TEST CONDITIONS. The test on polymeric materials shall be conducted under the following conditions:

Pressure	10 ⁻⁶ torr or less
Temperature of specimen	125°C ± 1°C
Temperature of condensable plates	25°C ± 1°C
Vacuum exposure time	24 hours

6.3 CRITERIA OF ACCEPTABILITY. The material shall have a volatile condensable material content of less than 0.1 percent of the original mass of the specimen. The total mass loss of the material shall not exceed 1.0 percent of the original mass of the specimen.

6.4 TEST EQUIPMENT. All laboratory test instrumentation shall be in current calibration and shall reflect appropriate documentation from the applicable calibration laboratory. The test equipment shall consist of the following:

- a. A vacuum system capable of maintaining 10⁻⁶ torr for a period of 24 hours.
- b. Specimen holder made of stainless steel or aluminum. The specimen holder shall be nominally 3.8 cm long and 1.25 cm in diameter.
- c. Collector plate shall be made of a highly polished stable metal surface. The collector plate shall be 3.8 cm in diameter.
- d. The test apparatus shall be made of copper. The apparatus shall be such that multiple specimen holders and collector plates can be accommodated at one time. The sample section shall be capable of maintaining the samples at 125 ± 1°C and maintaining the collector plates at 25 ± 1°C.

6.5 SAMPLE PREPARATION.

- 6.5.1 Specimen Size. Materials to be tested shall be prepared in 100 to 300 milligram specimen sizes and placed in stainless steel or aluminum holders after preparation as specified below.
- 6.5.2 Solid Materials. Specimens shall be cut into small pieces having 0.15 cm maximum dimension. Samples shall be placed in a desiccator after preparation and remain there until the samples are placed in the test chamber.
- 6.5.3 Coatings. Materials that are normally used as coatings shall be applied to aluminum foil or Teflon sheet and prepared as noted in paragraph 6.5.2.
- 6.5.4 Solvent Containing Materials. Prior to testing solvent containing materials, such as inks and paints or room temperature cured materials, the sample shall be preconditioned for 24 hours at $65 \pm 1^\circ\text{C}$ in an air circulating oven to simulate the material exposure up to the time of launch.
- 6.5.5 Tapes. Tapes shall be tested in the as-applied configuration using aluminum foil or Teflon sheet as an application substrate and prepared in accordance with paragraph 6.5.2.
- 6.5.6 Liquids. Liquids shall be tested in the as-received state.
- 6.5.7 Cure Procedures. All material shall be cured or applied in accordance with the manufacturer's procedures or the applicable contractor process specification prior to test.

6.6 TML AND VCM MEASUREMENT.

- 6.6.1 Initial Mass Determination. The VCM collector plate and specimen holder mass shall be measured. Specimens shall be tested and their mass measured after being desiccated for 24 hours.
- 6.6.2 Specimen Insertion. The weighed samples shall be placed in the compartments of the heating block and the VCM collector plates shall be fastened to the cooling block of the apparatus.
- 6.6.3 Pressure. The system shall be evacuated and held at a maximum pressure of 10^{-6} torr.

- 6.6.4 Application of Heat. When the unit has reached 10^{-6} torr, the specimens shall be heated to $125^{\circ}\text{C} \pm 1^{\circ}\text{C}$, and maintained for 24 hours. The VCM collector plates shall be maintained at $25^{\circ}\text{C} \pm 1^{\circ}\text{C}$ during the test.
- 6.6.5 Specimen Removal. The specimens in their holders and the VCM collector plates shall be removed from the apparatus and immediately placed in a desiccator.
- 6.6.6 Final Mass Determination. Measure the mass of the specimens and the collector plates as soon as possible after removal from the VCM apparatus, and record.

21.0 - SHRINKABLE MATERIALS

Product Designation	Mfg*	Material Specification	Outgassing		Cure Cycle (hours at °F)	Remarks
			Total Weight Loss (%)	VCMP(%)		
Penntube II -SMT	PFC	BS502556	0.00	0.00*	No further cure necessary	Shrink 10 minutes at 350°F
Thermofit Kynar	RAY	BS502579 (ST 10017)	0.27	0.09*	No further cure necessary	Shrink 10 minutes at 630°F
Thermofit TFE	RAY	BS502553	0.01	0.00*	No further cure necessary	Shrink 10 minutes at 230°F
**Shrinkable Mylar	STP	BS502644	0.68	0.05	No further cure necessary	Shrink 10 minutes at 230°F
Mylar 0.004 Wall	STP		0.62	0.03	10 min. at 230	
Mylar 0.012 Wall	STP		0.68	0.05	10 min. at 230	
Thermofit TFE-R	RAY		0.01	0.00	1 hr. at 302	

*See Index of Manufacturers

**Material used in electronic packaging applications

***Tested 1 hour at 300°F

22.0 - TAPES

33

Product Designation	Mfg*	Material Specification	Outgassing		Cure Cycle (hours at °F)	Remarks
			Total Weight Loss (%)	VCM(%)		
Mylar Type T	DUP	BS502577			No further cure necessary	Not pressure-sensitive, polyethylene terephthalate
Mystik 7452	BCM	BS502649	0.37	0.04	No further cure necessary	Pressure-sensitive, aluminum foil, rubber adhesive
**Fibremat-1	NME	BS502588 (ST 10022)	0.19	0.02	No further cure necessary	Dacon Webbing
**Scotch Brand No. 850	NME	BS502609 (ST 10070)	1.34	0.11	No further cure necessary	Aluminized polyester, pressure-sensitive
Electrical Tapes X-1170	MMA		0.96	0.47	No further cure necessary	Aluminum foil - 67% of Wt.
Electrical Tapes X-1181	MMA		0.52	0.21	No further cure necessary	Copper foil - 81% of Wt.
Mystic 830	BCM		0.77	0.07	16 hrs. at 302	ARFM**
Mystic 4043	BCM		0.68	0.02	No further cure necessary	ARFM**
Mystic 7341	BCM		0.65	0.01	No further cure necessary	ARFM**
Mystic 7452	BCM		0.15	0.06	No further cure necessary	ARFM**
Mystik 7420	BCM		0.84	0.02	No further cure necessary	ARFM** Tape, Copper backing
Mystik 7453	BCM		0.64	0.04	No further cure necessary	Tape - Aluminum backing
Mystik 4052	BCM		0.50	0.02	No further cure necessary	ARFM** Tape

Index of Manufacturers (sheet 1 of 3)

Code	Manufacturer
AAC	Ablestik Adhesive Company
ACB	American Cyanamid Company, Bloomingdale Department
ACF	American Cyanamid Company, Formica Corp.
ACM	Allied Chemical Corporation, Mesa Products, Plastics Division
AEC	American Enka Corp.
APC	Armstrong Products Company
ARP	American Reinforced Plastics Company
BCC	BASF Colors and Chemicals, Inc.
BCM	The Borden Company, Mystik Tape, Inc.
BFG	B. F. Goodrich Chemical Company
BIW	Boston Insulated Wire
CAR	Carter's Ink Company
CHR	Connecticut Hard Rubber Co.
CVC	Consolidated Vacuum Corporation
DCC	Dow-Corning Company
DUE	E. I. DuPont de Nemours and Company, Elastomer Chemicals Department
DUF	E. I. DuPont de Nemours and Company, Fabrics and Finishes Department
DUM	E. I. DuPont de Nemours and Company, Film Department
DUP	E. I. DuPont de Nemours and Company, Plastics Department
EFI	Electrofilm, Inc.
EKC	Eastman Kodak Company
EMC	Emerson and Cuming, Inc.
ENJ	Enjay Chemical Company
EPC	EpoxyLite Corporation

Index of Manufacturers (sheet 2 of 3)

Code	Manufacturer
FLC	Fortin Laminating Corporation
FPC	Finch Paint and Chemical Company
FPI	Furane Plastics, Inc.
FRC	Fargo Rubber Corporation
GBE	Gudebrod Brothers Silk Company, Inc., Electronics Division
GEC	General Electric Company, Chemical Materials Department
GES	General Electric Company, Silicone Products Department
GEW	General Electric Company, Wire and Cable Department
GMC	General Mills, Chemical Division
HCC	Hughson Chemical Company
HEX	Hexcel Products, Inc.
HYS	Hysol Corporation
IBM	IBM Corporation
IND	Independent Ink Company
ITR	Illinois Institute of Technology Research Institute
MCC	Magna Coatings and Chemical Corporation
MMA	3M Company, Adhesives, Coatings, and Sealers Division
MMC	3M Company, Chemical Division
MME	3M Company, Electrical Products Division
MMI	3M Company, Irvington Division
MRC	The Marblette Corporation
PER	Permacel
PFC	Pennsylvania Fluorocarbon Company
PKA	Park Avenue
PPH	Purolator Products, Inc., Hadbar Division
PRC	Products Research and Chemical Corporation

Index of Manufacturers (sheet 3 of 3)

Code	Manufacturer
PRP	Plastic and Rubber Products Company
PSC	Parker Seal Company
PTI	Product Techniques, Inc.
RAY	Rayclad Tubes, Inc.
REM	Rembrandt
SAN	Sanford's Ink Company
SOC	Shell Oil Company
SCA	Shell Chemical Company, Adhesives Department
SCP	Shell Chemical Company, Plastics and Resins Department
SIS	Sargent Industries, Stillman Rubber Division
SPT	Stone Paper Tube Company
TCC	Thiokol Chemical Corp.
THO	Thalco
TMC	The Mica Corporation
UCC	Union Carbide Chemicals Company
UCP	Union Carbide Corporation, Plastics Division
VVP	Vita Var Paint Company
WCN	Whittaker Corporation, Narmco Division
WEI	Westinghouse Electric Corporation, Insulating Materials Division
WEM	Westinghouse Electric Corporation, Micarta Division
WPP	Wornow Process Paint Company
