Authority

This publication has been developed by NIST to further its statutory responsibilities under the Federal Information Security Modernization Act (FISMA) of 2014, 44 U.S.C. § 3551 et seq., Public Law (P.L.) 113-283. NIST is responsible for developing information security standards and guidelines, including minimum requirements for federal information systems, but such standards and guidelines shall not apply to national security systems without the express approval of appropriate federal officials exercising policy authority over such systems. This guideline is consistent with the requirements of the Office of Management and Budget (OMB) Circular A-130.

Nothing in this publication should be taken to contradict the standards and guidelines made mandatory and binding on federal agencies by the Secretary of Commerce under statutory authority. Nor should these guidelines be interpreted as altering or superseding the existing authorities of the Secretary of Commerce, Director of the OMB, or any other federal official. This publication may be used by nongovernmental organizations on a voluntary basis and is not subject to copyright in the United States. Attribution would, however, be appreciated by NIST.

National Institute of Standards and Technology Special Publication 800-171
Natl. Inst. Stand. Technol. Spec. Publ. 800-171, **125 pages** (December 2016)

CODEN: NSPUE2

This publication is available free of charge from:

<https://doi.org/10.6028/NIST.SP.800-171r1>

Certain commercial entities, equipment, or materials may be identified in this document in order to describe an experimental procedure or concept adequately. Such identification is not intended to imply recommendation or endorsement by NIST, nor is it intended to imply that the entities, materials, or equipment are necessarily the best available for the purpose.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts, practices, and methodologies, may be used by federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, federal agencies may wish to closely follow the development of these new publications by NIST.

Organizations are encouraged to review draft publications during the designated public comment periods and provide feedback to NIST. Many NIST cybersecurity publications, other than the ones noted above, are available at <http://csrc.nist.gov/publications>.

Reports on Computer Systems Technology

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology (IT). ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in federal information systems. The Special Publication 800-series reports on ITL's research, guidelines, and outreach efforts in information systems security and its collaborative activities with industry, government, and academic organizations.

Abstract

The protection of Controlled Unclassified Information (CUI) resident in nonfederal systems and organizations is of paramount importance to federal agencies and can directly impact the ability of the federal government to successfully conduct its assigned missions and business operations. This publication provides federal agencies with a set of recommended security requirements for protecting the confidentiality of CUI when such information is resident in nonfederal systems and organizations; when the nonfederal organization is not collecting or maintaining information on behalf of a federal agency or using or operating a system on behalf of an agency; and where there are no specific safeguarding requirements for protecting the confidentiality of CUI prescribed by the authorizing law, regulation, or governmentwide policy for the CUI category or subcategory listed in the CUI Registry. The security requirements apply to all components of nonfederal systems and organizations that process, store, or transmit CUI, or that provide security protection for such components. The requirements are intended for use by federal agencies in contractual vehicles or other agreements established between those agencies and nonfederal organizations.

Keywords

Contractor Systems; Controlled Unclassified Information; CUI Registry; Derived Security Requirement; Executive Order 13556; FIPS Publication 199; FIPS Publication 200; FISMA; NIST Special Publication 800-53; Nonfederal Systems; Security Assessment; Security Control; Security Requirement.

Acknowledgements

The authors gratefully acknowledge and appreciate the contributions from Carol Bales, Matt Barrett, Jon Boyens, Devin Casey, Chris Enloe, Jim Foti, Rob Glenn, Rich Graubart, Vicki Michetti, Victoria Pillitteri, Pat O'Reilly, Karen Quigg, Mary Thomas, Matt Scholl, Murugiah Souppaya, and Pat Toth, whose thoughtful and constructive comments improved the overall quality, thoroughness, and usefulness of this publication. A special note of thanks goes to Peggy Himes and Elizabeth Lennon for their superb administrative and technical editing support.

CAUTIONARY NOTE

The Federal Information Security Modernization Act (FISMA) of 2014 requires federal agencies to identify and provide information security protections commensurate with the risk resulting from the unauthorized access, use, disclosure, disruption, modification, or destruction of information collected or maintained by or on behalf of an agency; or information systems used or operated by an agency or by a contractor of an agency or other organization on behalf of an agency. This publication focuses on protecting the *confidentiality* of Controlled Unclassified Information (CUI) in *nonfederal* systems and organizations, and recommends specific security requirements to achieve that objective. It does not change the information security requirements set forth in FISMA, nor does it alter the responsibility of federal agencies to comply with the full provisions of the statute, the policies established by OMB, and the supporting security standards and guidelines developed by NIST.

The requirements recommended for use in this publication are derived from FIPS Publication 200 and the moderate security control baseline in NIST Special Publication 800-53 and are based on the CUI regulation ([32 CFR Part 2002](#), *Controlled Unclassified Information*). The requirements and security controls have been determined over time to provide the necessary protection for federal information and systems that are covered under FISMA. The tailoring criteria applied to the FIPS Publication 200 security requirements and the NIST Special Publication 800-53 security controls is **not** an endorsement for the elimination of those requirements and controls—rather, the tailoring criteria focuses on the protection of CUI from unauthorized disclosure in nonfederal systems and organizations. Moreover, since the security requirements are derivative from the NIST publications listed above, organizations should **not** assume that satisfying those particular requirements will automatically satisfy the security requirements and controls in FIPS Publication 200 and Special Publication 800-53.

In addition to the security objective of *confidentiality*, the objectives of *integrity* and *availability* remain a high priority for organizations that are concerned with establishing and maintaining a comprehensive information security program. While the primary purpose of this publication is to define requirements to protect the confidentiality of CUI, there is a close relationship between confidentiality and integrity since many of the underlying security mechanisms at the system level support both security objectives. Organizations that are interested in or required to comply with the recommendations in this publication are strongly advised to review the complete listing of security controls in the moderate baseline in Appendix E to ensure that their individual security plans and security control deployments provide the necessary and sufficient protection to address the cyber and kinetic threats to organizational missions and business operations. Addressing such threats is important because of the dependence these organizations have on their information technology infrastructures for their mission and business success.

EXPECTATIONS FOR THIS PUBLICATION

Executive Order 13556, *Controlled Unclassified Information*, November 4, 2010, establishes that the Controlled Unclassified Information (CUI) Executive Agent designated as the National Archives and Records Administration (NARA), shall develop and issue such directives as are necessary to implement the CUI Program. Consistent with this tasking and with the CUI Program's mission to establish uniform policies and practices across the federal government, NARA is issuing a final federal regulation in 2016 to establish the required controls and markings for CUI government-wide. This federal regulation, once enacted, will bind agencies throughout the executive branch to uniformly apply the standard safeguards, markings, dissemination, and decontrol requirements established by the CUI Program.

Regarding *federal information systems*, requirements in the federal regulation for protecting CUI at the moderate confidentiality impact level will be based on applicable policies established by OMB and applicable governmentwide standards and guidelines issued by NIST. The regulation will not create these policies, standards, and guidelines which are already established by OMB and NIST. The regulation will, however, require adherence to the policies and use of the standards and guidelines in a consistent manner throughout the executive branch, thereby reducing current complexity for federal agencies and their nonfederal partners, including contractors.

In addition to defining safeguarding requirements for CUI within the federal government, NARA has taken steps to alleviate the potential impact of such requirements on nonfederal organizations by jointly developing with NIST, Special Publication 800-171 — and defining security requirements for protecting CUI in nonfederal systems and organizations. This approach will help nonfederal entities, including contractors, to comply with the security requirements using the systems and practices they already have in place, rather than trying to use government-specific approaches. It will also provide a standardized and uniform set of requirements for all CUI security needs, tailored to nonfederal systems, allowing nonfederal organizations to comply with statutory and regulatory requirements, and to consistently implement safeguards for the protection of CUI.

Finally, NARA, in its capacity as the CUI Executive Agent, also plans to sponsor in 2017, a single Federal Acquisition Regulation (FAR) clause that will apply the requirements contained in the federal CUI regulation and Special Publication 800-171 to contractors. This will further promote standardization to benefit a substantial number of nonfederal organizations that are attempting to meet the current range and type of contract clauses, where differing requirements and conflicting guidance from federal agencies for the same information gives rise to confusion and inefficiencies. The CUI FAR clause will also address verification and compliance requirements for the security requirements in NIST Special Publication 800-171. Until the formal process of establishing such a FAR clause takes place, the requirements in NIST Special Publication 800-171 may be referenced in federal contracts consistent with federal law and regulatory requirements. If necessary, Special Publication 800-171 will be updated to remain consistent with the federal CUI regulation and the FAR clause.

DEFINITION AND USAGE OF THE TERM INFORMATION SYSTEM

Unless otherwise specified by legislation, regulation, or governmentwide policy, the use of the term **information system** in this publication is replaced by the term **system**. This change reflects a more broad-based, holistic definition of information systems that includes, for example: general purpose information systems; industrial and process control systems; cyber-physical systems; and individual devices that are part of the *Internet of Things*. As computing platforms and technologies are increasingly deployed ubiquitously worldwide and systems and components are connected through wired and wireless networks, the susceptibility of Controlled Unclassified Information to loss or compromise grows—as does the potential for adverse consequences resulting from such occurrences.

FRAMEWORK FOR IMPROVING CRITICAL INFRASTRUCTURE CYBERSECURITY

Organizations that have implemented or plan to implement the [NIST Framework for Improving Critical Infrastructure Cybersecurity](#) can find in Appendix D of this publication, a direct mapping of the Controlled Unclassified Information (CUI) security requirements to the security controls in NIST Special Publication 800-53 and ISO/IEC 27001. These controls are also mapped to the specific Categories and Subcategories associated with Cybersecurity Framework Core Functions: *Identify, Protect, Detect, Respond, and Recover*. The security control mapping information can be useful to organizations that wish to demonstrate compliance to the security requirements in the context of their established information security programs, when such programs have been built around the NIST or ISO/IEC security controls.

CHAPTER ONE

INTRODUCTION

THE NEED TO PROTECT CONTROLLED UNCLASSIFIED INFORMATION

Today, more than at any time in history, the federal government is relying on external service providers to help carry out a wide range of federal missions and business functions using state-of-the-practice information systems.¹ Many federal contractors, for example, routinely process, store, and transmit sensitive federal information in their systems to support the delivery of essential products and services to federal agencies (e.g., providing credit card and other financial services; providing Web and electronic mail services; conducting background investigations for security clearances; processing healthcare data; providing cloud services; and developing communications, satellite, and weapons systems). Additionally, federal information is frequently provided to or shared with entities such as State and local governments, colleges and universities, and independent research organizations. The protection of sensitive federal information while residing in *nonfederal systems*² and organizations is of paramount importance to federal agencies and can directly impact the ability of the federal government to successfully carry out its designated missions and business operations, including those missions and functions related to the critical infrastructure.

The protection of unclassified federal information in nonfederal systems and organizations is dependent on the federal government providing a disciplined and structured process for identifying the different types of information that are routinely used by federal agencies. On November 4, 2010, the President signed [Executive Order 13556](#), *Controlled Unclassified Information*. The Executive Order established a governmentwide Controlled Unclassified Information (CUI)³ Program to standardize the way the executive branch handles unclassified information that requires protection and designated the National Archives and Records Administration (NARA) as the Executive Agent⁴ to implement that program. Only information that requires safeguarding or dissemination controls pursuant to federal law, regulation, or governmentwide policy may be designated as CUI.

The CUI Program is designed to address several deficiencies in managing and protecting unclassified information to include inconsistent markings, inadequate safeguarding, and needless restrictions, both by standardizing procedures and by providing common definitions through a [CUI Registry](#). The CUI Registry is the online repository for information, guidance, policy, and requirements on handling CUI, including issuances by the CUI Executive Agent. Among other information, the CUI Registry identifies approved CUI categories and subcategories, provides

¹ An *information system* is a discrete set of information resources organized expressly for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information. Information systems also include specialized systems for example, industrial/process control systems, cyber-physical systems, embedded systems, and devices. The term *system* is used throughout this publication to represent all types of computing platforms that can process, store, or transmit CUI.

² A *federal information system* is a system that is used or operated by an executive agency, by a contractor of an executive agency, or by another organization on behalf of an executive agency. A system that does not meet such criteria is a *nonfederal system*.

³ *Controlled Unclassified Information* is any information that law, regulation, or governmentwide policy requires to have safeguarding or disseminating controls, excluding information that is classified under [Executive Order 13526](#), *Classified National Security Information*, December 29, 2009, or any predecessor or successor order, or the Atomic Energy Act of 1954, as amended.

⁴ NARA has delegated this authority to the Information Security Oversight Office, which is a component of NARA.

general descriptions for each, identifies the basis for controls, and sets out procedures for the use of CUI, including but not limited to marking, safeguarding, transporting, disseminating, reusing, and disposing of the information.

Executive Order 13556 also required that the CUI Program emphasize openness, transparency, and uniformity of governmentwide practices, and that the implementation of the program take place in a manner consistent with applicable policies established by the Office of Management and Budget (OMB) and federal standards and guidelines issued by the National Institute of Standards and Technology (NIST). The federal CUI *regulation*,⁵ developed by the CUI Executive Agent, provides guidance to federal agencies on the designation, safeguarding, dissemination, marking, decontrolling, and disposition of CUI, establishes self-inspection and oversight requirements, and delineates other facets of the program.

1.1 PURPOSE AND APPLICABILITY

The purpose of this publication is to provide federal agencies with recommended security requirements for protecting the *confidentiality* of CUI when the CUI is resident in a nonfederal system and organization; when the nonfederal organization is *not* collecting or maintaining information on behalf of a federal agency or using or operating a system on behalf of an agency;⁶ and where there are no specific safeguarding requirements for protecting the confidentiality of CUI prescribed by the authorizing law, regulation, or governmentwide policy for the CUI category or subcategory listed in the CUI Registry.⁷ The security requirements apply *only* to components of nonfederal systems that process, store, or transmit CUI, or that provide security protection for such components.⁸ The security requirements are intended for use by federal agencies in appropriate contractual vehicles or other agreements established between those agencies and nonfederal organizations. In CUI guidance and the CUI Federal Acquisition Regulation (FAR),⁹ the CUI Executive Agent will address determining compliance with security requirements.¹⁰

In accordance with the federal CUI regulation, federal agencies using federal systems to process, store, or transmit CUI, as a minimum, must comply with:

- [Federal Information Processing Standards \(FIPS\) Publication 199](#), *Standards for Security Categorization of Federal Information and Information Systems* (moderate confidentiality);¹¹

⁵ [32 CFR Part 2002](#), *Controlled Unclassified Information*, issued September 14, 2016; effective November 14, 2016.

⁶ Nonfederal organizations that collect or maintain information *on behalf of* a federal agency or that use or operate a system *on behalf of* an agency, must comply with the requirements in FISMA, including the requirements in [FIPS Publication 200](#) and the security controls in [NIST Special Publication 800-53](#) (See 44 USC 3554(a)(1)(A)).

⁷ The requirements in this publication can be used to comply with the FISMA requirement for senior agency officials to provide information security for the information that supports the operations and assets under their control, including CUI that is resident in nonfederal systems and organizations (See 44 USC 3554(a)(1)(A) and 3554(a)(2)).

⁸ System *components* include, for example: mainframes, workstations, servers; input and output devices; network components; operating systems; virtual machines; and applications.

⁹ NARA, in its capacity as the CUI Executive Agent, plans to sponsor in 2017, a single FAR clause that will apply the requirements of the federal CUI regulation and NIST Special Publication 800-171 to contractors. Until the formal process of establishing such a single FAR clause takes place, the security requirements in NIST Special Publication 800-171 may be referenced in federal contracts consistent with federal law and regulatory requirements.

¹⁰ [NIST Special Publication 800-171A](#) provides assessment procedures to help organizations determine compliance to the security requirements in Chapter Three.

¹¹ [FIPS Publication 199](#) defines three values of potential impact (i.e., low, moderate, high) on organizations, assets, or individuals should there be a breach of security (e.g., a loss of confidentiality). The potential impact is *moderate* if the loss of confidentiality could be expected to have a *serious* adverse effect on organizational operations, organizational assets, or individuals.

- [Federal Information Processing Standards \(FIPS\) Publication 200](#), *Minimum Security Requirements for Federal Information and Information Systems*;
- [NIST Special Publication 800-53](#), *Security and Privacy Controls for Federal Information Systems and Organizations*; and
- [NIST Special Publication 800-60](#), *Guide for Mapping Types of Information and Information Systems to Security Categories*.¹²

The responsibility of federal agencies to protect and ensure the control of CUI does not change when such information is shared with nonfederal partners. Therefore, a similar level of protection is needed when CUI is processed, stored, or transmitted by *nonfederal organizations* using nonfederal systems.¹³ The specific requirements for safeguarding CUI in nonfederal systems and organizations are derived from the above authoritative federal standards and guidelines to maintain a consistent level of protection. However, recognizing that the scope of the safeguarding requirements in the federal CUI regulation is limited to the security objective of confidentiality (i.e., not directly addressing integrity and availability) and that some of the security requirements expressed in the NIST standards and guidelines are uniquely federal, the requirements in this publication have been *tailored* for nonfederal entities.

The tailoring criteria, described in [Chapter Two](#), are not intended to reduce or minimize the federal requirements for the safeguarding of CUI as expressed in the federal CUI regulation. Rather, the intent is to express the requirements in a manner that allows for and facilitates the equivalent safeguarding measures within nonfederal systems and organizations and does not diminish the level of protection of CUI required for moderate confidentiality. Additional or differing requirements other than those requirements described in this publication may be applied only when such requirements are based on law, regulation, or governmentwide policy and when indicated in the CUI Registry as CUI-specified. The provision of safeguarding requirements for CUI in a specified category will be addressed by NARA in its CUI guidance and in the CUI FAR, and reflected as specific requirements in contracts or other agreements.

If nonfederal organizations entrusted with protecting CUI designate systems or components for the processing, storage, or transmission of CUI, those organizations may limit the scope of the security requirements to only those systems or components. Isolating CUI into its own *security domain* by applying architectural design concepts (e.g., implementing subnetworks with firewalls or other boundary protection devices) may be the most cost-effective and efficient approach for nonfederal organizations to satisfy the security requirements and protect the confidentiality of CUI. Security domains may employ physical separation, logical separation, or a combination of both. This approach can reasonably provide adequate security for the CUI and avoid increasing the organization's security posture to a level beyond which it typically requires for protecting its missions, operations, and assets. Nonfederal organizations may choose to use the same CUI infrastructure for multiple government contracts or agreements, if the CUI infrastructure meets the safeguarding requirements for the organization's CUI-related contracts and/or agreements including any specific safeguarding required or permitted by the authorizing law, regulation, or governmentwide policy.

¹² [NIST Special Publication 800-60](#) is under revision to align with the CUI categories and subcategories in the CUI Registry.

¹³ A *nonfederal organization* is any entity that owns, operates, or maintains a nonfederal system. Examples include: State, local, and tribal governments; colleges and universities; and contractors.

1.2 TARGET AUDIENCE

This publication serves a diverse group of individuals and organizations in both the public and private sectors including, but not limited to individuals with:

- System development life cycle responsibilities (e.g., program managers, mission/business owners, information owners/stewards, system designers and developers, system/security engineers, systems integrators);
- Acquisition or procurement responsibilities (e.g., contracting officers);
- System, security, or risk management and oversight responsibilities (e.g., authorizing officials, chief information officers, chief information security officers, system owners, information security managers); and
- Security assessment and monitoring responsibilities (e.g., auditors, system evaluators, assessors, independent verifiers/validators, analysts).

The above roles and responsibilities can be viewed from two distinct perspectives: the *federal perspective* as the entity establishing and conveying the security requirements in contractual vehicles or other types of inter-organizational agreements; and the *nonfederal perspective* as the entity responding to and complying with the security requirements set forth in contracts or agreements.

1.3 ORGANIZATION OF THIS SPECIAL PUBLICATION

The remainder of this special publication is organized as follows:

- [Chapter Two](#) describes the fundamental assumptions and methodology used to develop the security requirements for protecting the confidentiality of CUI; the format and structure of the requirements; and the tailoring criteria applied to the NIST standards and guidelines to obtain the requirements.
- [Chapter Three](#) describes the fourteen families of security requirements for protecting the confidentiality of CUI in nonfederal systems and organizations.
- [Supporting appendices](#) provide additional information related to the protection of CUI in nonfederal systems and organizations including: general references; definitions and terms; acronyms; mapping tables relating security requirements to the security controls in NIST Special Publication 800-53 and ISO/IEC 27001; an explanation of the tailoring actions applied to the moderate security control baseline; and an expanded discussion about each security requirement.

CHAPTER TWO

THE FUNDAMENTALS

ASSUMPTIONS AND METHODOLOGY FOR DEVELOPING SECURITY REQUIREMENTS

This chapter describes the assumptions and methodology used to develop the security requirements to protect CUI in nonfederal systems and organizations; the structure of the basic and derived security requirements; and the tailoring criteria applied to the federal information security requirements and controls.

2.1 BASIC ASSUMPTIONS

The security requirements described in this publication have been developed based on three fundamental assumptions:

- Statutory and regulatory requirements for the protection of CUI are *consistent*, whether such information resides in federal systems or nonfederal systems including the environments in which those systems operate;
- Safeguards implemented to protect CUI are *consistent* in both federal and nonfederal systems and organizations; and
- The confidentiality impact value for CUI is no less than *moderate*¹⁴ in accordance with Federal Information Processing Standards (FIPS) Publication 199.¹⁵

The above assumptions reinforce the concept that federal information designated as CUI has the same intrinsic *value* and potential *adverse impact* if compromised—whether such information resides in a federal or a nonfederal organization. Thus, protecting the confidentiality of CUI is critical to the mission and business success of federal agencies and the economic and national security interests of the nation. Additional assumptions also impacting the development of the security requirements and the expectation of federal agencies in working with nonfederal entities include:

- Nonfederal organizations have information technology infrastructures in place, and are not necessarily developing or acquiring systems specifically for processing, storing, or transmitting CUI;
- Nonfederal organizations have specific safeguarding measures in place to protect their information which may also be sufficient to satisfy the security requirements;
- Nonfederal organizations can implement a variety of potential security solutions either directly or through the use of managed services, to satisfy security requirements; and
- Nonfederal organizations may not have the necessary organizational structure or resources to satisfy every security requirement and may implement alternative, but equally effective, security measures to compensate for the inability to satisfy a requirement.

¹⁴ The moderate impact *value* defined in [FIPS Publication 199](#) may become part of a moderate impact *system* in [FIPS Publication 200](#), which in turn, requires the use of the moderate security control baseline in [NIST Special Publication 800-53](#) as the starting point for tailoring actions.

¹⁵ In accordance with [32 CFR 2002\(g\)](#), CUI is categorized at no less than the moderate confidentiality impact value. However, when federal law, regulation, or governmentwide policy establishing the control of the CUI specifies controls that differ from those of the moderate confidentiality baseline, then these will be followed.

IMPLEMENTING A SINGLE STATE SECURITY SOLUTION FOR CUI

Controlled Unclassified Information has the *same value*, whether such information is resident in a federal system that is part of a federal agency or a nonfederal system that is part of a nonfederal organization. Accordingly, the security requirements contained in this publication are consistent with and complementary to the standards and guidelines used by federal agencies to protect CUI.

2.2 DEVELOPMENT OF SECURITY REQUIREMENTS

The security requirements for protecting the confidentiality of CUI in nonfederal systems and organizations have a well-defined structure that consists of a *basic security requirements* section and a *derived security requirements* section. The basic security requirements are obtained from [FIPS Publication 200](#), which provides the high-level and fundamental security requirements for federal information and systems. The derived security requirements, which supplement the basic security requirements, are taken from the security controls in [NIST Special Publication 800-53](#). Starting with the FIPS Publication 200 security requirements and the security controls in the moderate baseline (i.e., the minimum level of protection required for CUI in federal systems and organizations), the requirements and controls are *tailored* to eliminate requirements, controls, or parts of controls that are:

- Uniquely federal (i.e., primarily the responsibility of the federal government);
- Not directly related to protecting the confidentiality of CUI; or
- Expected to be routinely satisfied by nonfederal organizations without specification.¹⁶

[Appendix E](#) provides a complete listing of security controls that support the CUI derived security requirements and those controls that have been eliminated from the NIST Special Publication 800-53 moderate baseline based on the CUI tailoring criteria described above.

The combination of the basic and derived security requirements captures the intent of FIPS Publication 200 and NIST Special Publication 800-53, with respect to the protection of the *confidentiality* of CUI in nonfederal systems and organizations. [Appendix D](#) provides informal mappings of the security requirements to the relevant security controls in NIST Special Publication 800-53 and ISO/IEC 27001. The mappings promote a better understanding of the security requirements and are *not* intended to impose additional requirements on nonfederal organizations.

¹⁶ The security requirements developed from the tailored [FIPS Publication 200](#) security requirements and the [NIST Special Publication 800-53](#) moderate security control baseline represent a subset of the safeguarding measures that are necessary for a *comprehensive* information security program. The strength and quality of such programs in nonfederal organizations depend on the degree to which the organizations implement the security requirements and controls that are expected to be routinely satisfied without specification by the federal government. This includes implementing security policies, procedures, and practices that support an effective risk-based information security program. Nonfederal organizations are encouraged to refer to [Appendix E](#) and Special Publication 800-53 for a complete listing of security controls in the moderate baseline deemed out of scope for the security requirements in [Chapter Three](#).

The following example taken from the *Configuration Management* family illustrates the structure of a typical security requirement:

Basic Security Requirements

- Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.
- Establish and enforce security configuration settings for information technology products employed in organizational systems.

Derived Security Requirements

- Track, review, approve or disapprove, and audit changes to systems.
- Analyze the security impact of changes prior to implementation.
- Define, document, approve, and enforce physical and logical access restrictions associated with changes to systems.
- Employ the principle of least functionality by configuring systems to provide only essential capabilities.
- Restrict, disable, and prevent the use of nonessential programs, functions, ports, protocols, and services.
- Apply deny-by-exception (blacklisting) policy to prevent the use of unauthorized software or deny-all, permit-by-exception (whitelisting) policy to allow the execution of authorized software.
- Control and monitor user-installed software.

For ease of use, the security requirements are organized into fourteen *families*. Each family contains the requirements related to the general security topic of the family. The families are closely aligned with the minimum-security requirements for federal information and systems described in [FIPS Publication 200](#). The *contingency planning*, *system and services acquisition*, and *planning* requirements are not included within the scope of this publication due to the tailoring criteria.¹⁷ Table 1 lists the security requirement families addressed in this publication.

TABLE 1: SECURITY REQUIREMENT FAMILIES

FAMILY	FAMILY
Access Control	Media Protection
Awareness and Training	Personnel Security
Audit and Accountability	Physical Protection
Configuration Management	Risk Assessment
Identification and Authentication	Security Assessment
Incident Response	System and Communications Protection
Maintenance	System and Information Integrity

¹⁷ Three exceptions include: a requirement to protect the confidentiality of system backups (derived from CP-9) from the *contingency planning* family; a requirement to develop and implement a system security plan (derived from PL-2) from the *planning* family; and a requirement to implement system security engineering principles (derived from SA-8) from the *system and services acquisition* family. For convenience, these requirements are included with the CUI *media protection*, *security assessment*, and *system and communications protection* requirements families, respectively.

CHAPTER THREE

THE REQUIREMENTS

SECURITY REQUIREMENTS FOR PROTECTING THE CONFIDENTIALITY OF CUI

This chapter describes fourteen families of security requirements (including basic and derived requirements) for protecting the confidentiality of CUI in nonfederal systems and organizations.¹⁸ The security controls from [NIST Special Publication 800-53](#) associated with the basic and derived requirements are also listed in Appendix D.¹⁹ Organizations can use Special Publication 800-53 to obtain additional, non-prescriptive information related to the security requirements (e.g., supplemental guidance related to each of the referenced security controls, mapping tables to ISO/IEC security controls, and a catalog of optional controls that can be used to help specify additional security requirements if needed). This information can help clarify or interpret the requirements in the context of mission and business requirements, operational environments, or assessments of risk. Nonfederal organizations can implement a variety of potential security solutions either directly or using managed services, to satisfy the security requirements and may implement alternative, but equally effective, security measures to compensate for the inability to satisfy a requirement.²⁰

Nonfederal organizations should describe in a system security plan, how the specified security requirements are met or how organizations plan to meet the requirements. The plan describes the system boundary; the operational environment; how the security requirements are implemented; and the relationships with or connections to other systems. Nonfederal organizations should develop plans of action that describe how any unimplemented security requirements will be met and how any planned mitigations will be implemented. Organizations can document the system security plan and plan of action as separate or combined documents and in any chosen format.

THE MEANING OF ORGANIZATIONAL SYSTEMS

The term *organizational system* is used in many of the CUI security requirements in NIST Special Publication 800-171. This term has a specific meaning regarding the scope of applicability for the CUI security requirements. The requirements apply only to components of nonfederal systems that process, store, or transmit CUI, or that provide security protection for such components. The appropriate scoping for the security requirements is an important factor in determining protection-related investment decisions and managing security risk for nonfederal organizations that have the responsibility of safeguarding CUI.

¹⁸ While the purpose of this publication is to define requirements to protect the confidentiality of CUI, there is a close relationship between confidentiality and integrity since many of the underlying security mechanisms at the system level support both security objectives. Thus, the integrity requirements (either basic or derived) may have a significant, albeit indirect, effect on the ability of an organization to protect the confidentiality of CUI.

¹⁹ The security control references in [Appendix D](#) are included to promote a better understanding of the security requirements. The control references are not intended to impose additional requirements on nonfederal organizations. Moreover, because the security controls were developed for federal agencies, the supplemental guidance associated with those controls may not be applicable to nonfederal organizations.

²⁰ To promote consistency, transparency, and comparability, compensatory security measures selected by organizations should be based on or derived from *existing* and *recognized* security standards and control sets, including, for example: [ISO/IEC 27001](#) or [NIST Special Publication 800-53](#).

When requested, the system security plan and any associated plans of action for any planned implementations or mitigations should be submitted to the responsible federal agency/contracting officer to demonstrate the nonfederal organization's implementation or planned implementation of the security requirements. Federal agencies may consider the submitted system security plans and plans of action as critical inputs to an overall risk management decision to process, store, or transmit CUI on a system hosted by a nonfederal organization and whether it is advisable to pursue an agreement or contract with the nonfederal organization.

The security requirements in this publication should be applied to the nonfederal organization's internal systems processing, storing, or transmitting CUI. Some systems, including specialized systems (e.g., industrial/process control systems, Computer Numerical Control machines, medical devices), may have restrictions or limitations on the application of certain security requirements. To accommodate such issues, the system security plan, as reflected in Requirement [3.12.4](#), should be used to describe any enduring exceptions to the security requirements. Individual, isolated, or temporary deficiencies should be managed through plans of action, as reflected in Requirement [3.12.2](#).

[Appendix F](#) provides expanded information on the CUI security requirements. Hyperlinks in the CUI requirements below provide direct accessibility to the discussion section in the appendix.

3.1 ACCESS CONTROL

Basic Security Requirements

- [3.1.1](#) Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).
- [3.1.2](#) Limit system access to the types of transactions and functions that authorized users are permitted to execute.

Derived Security Requirements

- [3.1.3](#) Control the flow of CUI in accordance with approved authorizations.
- [3.1.4](#) Separate the duties of individuals to reduce the risk of malevolent activity without collusion.
- [3.1.5](#) Employ the principle of least privilege, including for specific security functions and privileged accounts.
- [3.1.6](#) Use non-privileged accounts or roles when accessing nonsecurity functions.
- [3.1.7](#) Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.
- [3.1.8](#) Limit unsuccessful logon attempts.
- [3.1.9](#) Provide privacy and security notices consistent with applicable CUI rules.
- [3.1.10](#) Use session lock with pattern-hiding displays to prevent access and viewing of data after a period of inactivity.
- [3.1.11](#) Terminate (automatically) a user session after a defined condition.
- [3.1.12](#) Monitor and control remote access sessions.
- [3.1.13](#) Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.
- [3.1.14](#) Route remote access via managed access control points.
- [3.1.15](#) Authorize remote execution of privileged commands and remote access to security-relevant information.

- [3.1.16](#) Authorize wireless access prior to allowing such connections.
- [3.1.17](#) Protect wireless access using authentication and encryption.
- [3.1.18](#) Control connection of mobile devices.
- [3.1.19](#) Encrypt CUI on mobile devices and mobile computing platforms.²¹
- [3.1.20](#) Verify and control/limit connections to and use of external systems.
- [3.1.21](#) Limit use of portable storage devices on external systems.
- [3.1.22](#) Control CUI posted or processed on publicly accessible systems.

[Mapping access control requirements to controls](#)

3.2 AWARENESS AND TRAINING

Basic Security Requirements

- [3.2.1](#) Ensure that managers, systems administrators, and users of organizational systems are made aware of the security risks associated with their activities and of the applicable policies, standards, and procedures related to the security of those systems.
- [3.2.2](#) Ensure that personnel are trained to carry out their assigned information security-related duties and responsibilities.

Derived Security Requirements

- [3.2.3](#) Provide security awareness training on recognizing and reporting potential indicators of insider threat.

[Mapping awareness and training requirements to controls](#)

3.3 AUDIT AND ACCOUNTABILITY

Basic Security Requirements

- [3.3.1](#) Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.
- [3.3.2](#) Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.

Derived Security Requirements

- [3.3.3](#) Review and update logged events.
- [3.3.4](#) Alert in the event of an audit logging process failure.
- [3.3.5](#) Correlate audit record review, analysis, and reporting processes for investigation and response to indications of unlawful, unauthorized, suspicious, or unusual activity.
- [3.3.6](#) Provide audit record reduction and report generation to support on-demand analysis and reporting.
- [3.3.7](#) Provide a system capability that compares and synchronizes internal system clocks with an authoritative source to generate time stamps for audit records.
- [3.3.8](#) Protect audit information and audit logging tools from unauthorized access, modification, and deletion.

²¹ Mobile devices and mobile computing platforms include, for example, smartphones, tablets, E-readers, and notebook computers.

3.3.9 Limit management of audit logging functionality to a subset of privileged users.

Mapping audit and accountability requirements to controls

3.4 CONFIGURATION MANAGEMENT

Basic Security Requirements

3.4.1 Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.

3.4.2 Establish and enforce security configuration settings for information technology products employed in organizational systems.

Derived Security Requirements

3.4.3 Track, review, approve or disapprove, and log changes to organizational systems.

3.4.4 Analyze the security impact of changes prior to implementation.

3.4.5 Define, document, approve, and enforce physical and logical access restrictions associated with changes to organizational systems.

3.4.6 Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.

3.4.7 Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.

3.4.8 Apply deny-by-exception (blacklisting) policy to prevent the use of unauthorized software or deny-all, permit-by-exception (whitelisting) policy to allow the execution of authorized software.

3.4.9 Control and monitor user-installed software.

Mapping configuration management requirements to controls

3.5 IDENTIFICATION AND AUTHENTICATION

Basic Security Requirements

3.5.1 Identify system users, processes acting on behalf of users, and devices.

3.5.2 Authenticate (or verify) the identities of users, processes, or devices, as a prerequisite to allowing access to organizational systems.

Derived Security Requirements

3.5.3 Use multifactor authentication²² for local and network access²³ to privileged accounts and for network access to non-privileged accounts.

3.5.4 Employ replay-resistant authentication mechanisms for network access to privileged and non-privileged accounts.

²² *Multifactor authentication* requires two or more different factors to achieve authentication. The factors include: something you know (e.g., password/PIN); something you have (e.g., cryptographic identification device, token); or something you are (e.g., biometric). The requirement for multifactor authentication should not be interpreted as requiring federal Personal Identity Verification (PIV) card or Department of Defense Common Access Card (CAC)-like solutions. A variety of multifactor solutions (including those with replay resistance) using tokens and biometrics are commercially available. Such solutions may employ hard tokens (e.g., smartcards, key fobs, or dongles) or soft tokens to store user credentials.

²³ *Local access* is any access to a system by a user (or process acting on behalf of a user) communicating through a direct connection without the use of a network. *Network access* is any access to a system by a user (or a process acting on behalf of a user) communicating through a network (e.g., local area network, wide area network, Internet).

- [3.5.5](#) Prevent reuse of identifiers for a defined period.
- [3.5.6](#) Disable identifiers after a defined period of inactivity.
- [3.5.7](#) Enforce a minimum password complexity and change of characters when new passwords are created.
- [3.5.8](#) Prohibit password reuse for a specified number of generations.
- [3.5.9](#) Allow temporary password use for system logons with an immediate change to a permanent password.
- [3.5.10](#) Store and transmit only cryptographically-protected passwords.
- [3.5.11](#) Obscure feedback of authentication information.

[Mapping identification and authentication requirements to controls](#)

3.6 INCIDENT RESPONSE

Basic Security Requirements

- [3.6.1](#) Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.
- [3.6.2](#) Track, document, and report incidents to designated officials and/or authorities both internal and external to the organization.

Derived Security Requirements

- [3.6.3](#) Test the organizational incident response capability.

[Mapping incident response requirements to controls](#)

3.7 MAINTENANCE

Basic Security Requirements

- [3.7.1](#) Perform maintenance on organizational systems.²⁴
- [3.7.2](#) Provide controls on the tools, techniques, mechanisms, and personnel used to conduct system maintenance.

Derived Security Requirements

- [3.7.3](#) Ensure equipment removed for off-site maintenance is sanitized of any CUI.
- [3.7.4](#) Check media containing diagnostic and test programs for malicious code before the media are used in organizational systems.
- [3.7.5](#) Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.
- [3.7.6](#) Supervise the maintenance activities of maintenance personnel without required access authorization.

[Mapping maintenance requirements to controls](#)

²⁴ In general, system maintenance requirements tend to support the security objective of *availability*. However, improper system maintenance or a failure to perform maintenance can result in the unauthorized disclosure of CUI, thus compromising *confidentiality* of that information.

3.8 MEDIA PROTECTION

Basic Security Requirements

- [3.8.1](#) Protect (i.e., physically control and securely store) system media containing CUI, both paper and digital.
- [3.8.2](#) Limit access to CUI on system media to authorized users.
- [3.8.3](#) Sanitize or destroy system media containing CUI before disposal or release for reuse.

Derived Security Requirements

- [3.8.4](#) Mark media with necessary CUI markings and distribution limitations.²⁵
- [3.8.5](#) Control access to media containing CUI and maintain accountability for media during transport outside of controlled areas.
- [3.8.6](#) Implement cryptographic mechanisms to protect the confidentiality of CUI stored on digital media during transport unless otherwise protected by alternative physical safeguards.
- [3.8.7](#) Control the use of removable media on system components.
- [3.8.8](#) Prohibit the use of portable storage devices when such devices have no identifiable owner.
- [3.8.9](#) Protect the confidentiality of backup CUI at storage locations.

[Mapping media protection requirements to controls](#)

3.9 PERSONNEL SECURITY

Basic Security Requirements

- [3.9.1](#) Screen individuals prior to authorizing access to organizational systems containing CUI.
- [3.9.2](#) Ensure that organizational systems containing CUI are protected during and after personnel actions such as terminations and transfers.

Derived Security Requirements

None.

[Mapping personnel security requirements to controls](#)

3.10 PHYSICAL PROTECTION

Basic Security Requirements

- [3.10.1](#) Limit physical access to organizational systems, equipment, and the respective operating environments to authorized individuals.
 - [3.10.2](#) Protect and monitor the physical facility and support infrastructure for organizational systems.
- ### *Derived Security Requirements*
- [3.10.3](#) Escort visitors and monitor visitor activity.
 - [3.10.4](#) Maintain audit logs of physical access.
 - [3.10.5](#) Control and manage physical access devices.
 - [3.10.6](#) Enforce safeguarding measures for CUI at alternate work sites.

[Mapping physical protection requirements to controls](#)

²⁵ The implementation of this requirement is per marking guidance in the 32 CFR, Part 2002, and the CUI Registry.

3.11 RISK ASSESSMENT

Basic Security Requirements

- 3.11.1** Periodically assess the risk to organizational operations (including mission, functions, image, or reputation), organizational assets, and individuals, resulting from the operation of organizational systems and the associated processing, storage, or transmission of CUI.

Derived Security Requirements

- 3.11.2** Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting those systems and applications are identified.
- 3.11.3** Remediate vulnerabilities in accordance with risk assessments.

Mapping risk assessment requirements to controls

3.12 SECURITY ASSESSMENT

Basic Security Requirements

- 3.12.1** Periodically assess the security controls in organizational systems to determine if the controls are effective in their application.
- 3.12.2** Develop and implement plans of action designed to correct deficiencies and reduce or eliminate vulnerabilities in organizational systems.
- 3.12.3** Monitor security controls on an ongoing basis to ensure the continued effectiveness of the controls.
- 3.12.4** Develop, document, and periodically update system security plans that describe system boundaries, system environments of operation, how security requirements are implemented, and the relationships with or connections to other systems.²⁶

Derived Security Requirements

None.

Mapping security assessment requirements to controls

3.13 SYSTEM AND COMMUNICATIONS PROTECTION

Basic Security Requirements

- 3.13.1** Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.
- 3.13.2** Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.

Derived Security Requirements

- 3.13.3** Separate user functionality from system management functionality.
- 3.13.4** Prevent unauthorized and unintended information transfer via shared system resources.
- 3.13.5** Implement subnetworks for publicly accessible system components that are physically or logically separated from internal networks.

²⁶ There is no prescribed format or specified level of detail for *system security plans*. However, organizations ensure that the required information in [3.12.4](#) is conveyed in those plans.

- [3.13.6](#) Deny network communications traffic by default and allow network communications traffic by exception (i.e., deny all, permit by exception).
- [3.13.7](#) Prevent remote devices from simultaneously establishing non-remote connections with organizational systems and communicating via some other connection to resources in external networks (i.e., split tunneling).
- [3.13.8](#) Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.
- [3.13.9](#) Terminate network connections associated with communications sessions at the end of the sessions or after a defined period of inactivity.
- [3.13.10](#) Establish and manage cryptographic keys for cryptography employed in organizational systems.
- [3.13.11](#) Employ FIPS-validated cryptography when used to protect the confidentiality of CUI.
- [3.13.12](#) Prohibit remote activation²⁷ of collaborative computing devices and provide indication of devices in use to users present at the device.
- [3.13.13](#) Control and monitor the use of mobile code.
- [3.13.14](#) Control and monitor the use of Voice over Internet Protocol (VoIP) technologies.
- [3.13.15](#) Protect the authenticity of communications sessions.
- [3.13.16](#) Protect the confidentiality of CUI at rest.

[Mapping system and communications protection requirements to controls](#)

3.14 SYSTEM AND INFORMATION INTEGRITY

Basic Security Requirements

- [3.14.1](#) Identify, report, and correct system flaws in a timely manner.
- [3.14.2](#) Provide protection from malicious code at designated locations within organizational systems.
- [3.14.3](#) Monitor system security alerts and advisories and take action in response.

Derived Security Requirements

- [3.14.4](#) Update malicious code protection mechanisms when new releases are available.
- [3.14.5](#) Perform periodic scans of organizational systems and real-time scans of files from external sources as files are downloaded, opened, or executed.
- [3.14.6](#) Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.
- [3.14.7](#) Identify unauthorized use of organizational systems.

[Mapping system and information integrity requirements to controls](#)

²⁷ Dedicated video conferencing systems, which rely on one of the participants calling or connecting to the other party to activate the video conference, are excluded.

NARA, SECURITY REQUIREMENTS, AND THE FAR CLAUSE

[Executive Order 13556](#), *Controlled Unclassified Information*, November 4, 2010, established the CUI Program and designated the National Archives and Record Administration (NARA) as its Executive Agent to implement the Order and to oversee agency actions to ensure compliance with the Order. The CUI Executive Agent anticipates establishing a single Federal Acquisition Regulation (FAR) clause in 2017 to apply the security requirements of NIST Special Publication 800-171 to contractor environments as well as to determine oversight responsibilities and requirements. The Executive Agent also addresses its oversight of federal agencies in the [32 CFR Part 2002](#). The approaches to federal oversight will be determined through the uniform CUI FAR clause, future understandings, and any agreements between federal agencies and their nonfederal information-sharing partners.

APPENDIX B

GLOSSARY

COMMON TERMS AND DEFINITIONS

Appendix B provides definitions for security terminology used within Special Publication 800-171. Unless specifically defined in this glossary, all terms used in this publication are consistent with the definitions contained in [CNSS Instruction 4009](#), *National Information Assurance Glossary*.

agency	See <i>executive agency</i> .
assessment	See <i>Security Control Assessment</i> .
assessor	See <i>Security Control Assessor</i> .
audit log	A chronological record of system activities, including records of system accesses and operations performed in a given period.
audit record	An individual entry in an audit log related to an audited event.
authentication [FIPS 200, Adapted]	Verifying the identity of a user, process, or device, often as a prerequisite to allowing access to resources in a system.
availability [44 U.S.C., Sec. 3542]	Ensuring timely and reliable access to and use of information.
baseline configuration	A documented set of specifications for a system, or a configuration item within a system, that has been formally reviewed and agreed on at a given point in time, and which can be changed only through change control procedures.
blacklisting	A process used to identify software programs that are not authorized to execute on a system or prohibited Universal Resource Locators (URL)/websites.
confidentiality [44 U.S.C., Sec. 3542]	Preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information.
configuration management	A collection of activities focused on establishing and maintaining the integrity of information technology products and systems, through control of processes for initializing, changing, and monitoring the configurations of those products and systems throughout the system development life cycle.
configuration settings	The set of parameters that can be changed in hardware, software, or firmware that affect the security posture and/or functionality of the system.
controlled area	Any area or space for which the organization has confidence that the physical and procedural protections provided are sufficient to meet the requirements established for protecting the information or system.

controlled unclassified information [E.O. 13556]	Information that law, regulation, or governmentwide policy requires to have safeguarding or disseminating controls, excluding information that is classified under Executive Order 13526, <i>Classified National Security Information</i> , December 29, 2009, or any predecessor or successor order, or the Atomic Energy Act of 1954, as amended.
CUI categories or subcategories [Title 32 CFR, Part 2002]	Those types of information for which laws, regulations, or governmentwide policies require or permit agencies to exercise safeguarding or dissemination controls, and which the CUI Executive Agent has approved and listed in the CUI Registry.
CUI Executive Agent [Title 32 CFR, Part 2002]	The National Archives and Records Administration (NARA), which implements the executive branch-wide CUI Program and oversees federal agency actions to comply with Executive Order 13556. NARA has delegated this authority to the Director of the Information Security Oversight Office (ISOO).
CUI program [Title 32 CFR, Part 2002]	The executive branch-wide program to standardize CUI handling by all federal agencies. The program includes the rules, organization, and procedures for CUI, established by Executive Order 13556, 32 CFR Part 2002, and the CUI Registry.
CUI registry [Title 32 CFR, Part 2002]	The online repository for all information, guidance, policy, and requirements on handling CUI, including everything issued by the CUI Executive Agent other than 32 CFR Part 2002. Among other information, the CUI Registry identifies all approved CUI categories and subcategories, provides general descriptions for each, identifies the basis for controls, establishes markings, and includes guidance on handling procedures.
environment of operation [NIST SP 800-37, Adapted]	The physical surroundings in which a system processes, stores, and transmits information.
executive agency [41 U.S.C., Sec. 403]	An executive department specified in 5 U.S.C., Sec. 105; a military department specified in 5 U.S.C., Sec. 102; an independent establishment as defined in 5 U.S.C., Sec. 104(1); and a wholly owned Government corporation fully subject to the provisions of 31 U.S.C., Chapter 91.
external system (or component)	A system or component of a system that is outside of the authorization boundary established by the organization and for which the organization typically has no direct control over the application of required security controls or the assessment of security control effectiveness.
external system service	A system service that is implemented outside of the authorization boundary of the organizational system (i.e., a service that is used by, but not a part of, the organizational system) and for which the organization typically has no direct control over the application of required security controls or the assessment of security control effectiveness.

external system service provider	A provider of external system services to an organization through a variety of consumer-producer relationships including but not limited to: joint ventures; business partnerships; outsourcing arrangements (i.e., through contracts, interagency agreements, lines of business arrangements); licensing agreements; and/or supply chain exchanges.
external network	A network not controlled by the organization.
federal agency	See <i>executive agency</i> .
federal information system [40 U.S.C., Sec. 11331]	An information system used or operated by an executive agency, by a contractor of an executive agency, or by another organization on behalf of an executive agency.
FIPS-validated cryptography	A cryptographic module validated by the Cryptographic Module Validation Program (CMVP) to meet requirements specified in FIPS Publication 140-2 (as amended). As a prerequisite to CMVP validation, the cryptographic module is required to employ a cryptographic algorithm implementation that has successfully passed validation testing by the Cryptographic Algorithm Validation Program (CAVP). See <i>NSA-Approved Cryptography</i> .
firmware	Computer programs and data stored in hardware - typically in read-only memory (ROM) or programmable read-only memory (PROM) - such that the programs and data cannot be dynamically written or modified during execution of the programs.
hardware	The physical components of a system. See <i>Software</i> and <i>Firmware</i> .
identifier	Unique data used to represent a person's identity and associated attributes. A name or a card number are examples of identifiers. A unique label used by a system to indicate a specific entity, object, or group.
impact	The effect on organizational operations, organizational assets, individuals, other organizations, or the Nation (including the national security interests of the United States) of a loss of confidentiality, integrity, or availability of information or a system.
impact value	The assessed potential impact resulting from a compromise of the confidentiality of information (e.g., CUI) expressed as a value of low, moderate, or high.
incident [FIPS 200, Adapted]	An occurrence that actually or potentially jeopardizes the confidentiality, integrity, or availability of a system or the information the system processes, stores, or transmits or that constitutes a violation or imminent threat of violation of security policies, security procedures, or acceptable use policies.
information	Any communication or representation of knowledge such as facts, data, or opinions in any medium or form, including textual, numerical, graphic, cartographic, narrative, or audiovisual.

information flow control	Procedure to ensure that information transfers within a system are not made in violation of the security policy.
information resources [44 U.S.C., Sec. 3502]	Information and related resources, such as personnel, equipment, funds, and information technology.
information security [44 U.S.C., Sec. 3542]	The protection of information and information systems from unauthorized access, use, disclosure, disruption, modification, or destruction in order to provide confidentiality, integrity, and availability.
information system [44 U.S.C., Sec. 3502]	A discrete set of information resources organized for the collection, processing, maintenance, use, sharing, dissemination, or disposition of information.
information technology [40 U.S.C., Sec. 1401]	Any equipment or interconnected system or subsystem of equipment that is used in the automatic acquisition, storage, manipulation, management, movement, control, display, switching, interchange, transmission, or reception of data or information by the executive agency. For purposes of the preceding sentence, equipment is used by an executive agency if the equipment is used by the executive agency directly or is used by a contractor under a contract with the executive agency which: (i) requires the use of such equipment; or (ii) requires the use, to a significant extent, of such equipment in the performance of a service or the furnishing of a product. The term <i>information technology</i> includes computers, ancillary equipment, software, firmware, and similar procedures, services (including support services), and related resources.
insider threat	The threat that an insider will use her/his authorized access, wittingly or unwittingly, to do harm to the security of the United States. This threat can include damage to the United States through espionage, terrorism, unauthorized disclosure, or through the loss or degradation of departmental resources or capabilities.
integrity [44 U.S.C., Sec. 3542]	Guarding against improper information modification or destruction, and includes ensuring information non-repudiation and authenticity.
internal network	A network where establishment, maintenance, and provisioning of security controls are under the direct control of organizational employees or contractors; or the cryptographic encapsulation or similar security technology implemented between organization-controlled endpoints, provides the same effect (with regard to confidentiality and integrity). An internal network is typically organization-owned, yet may be organization-controlled while not being organization-owned.
least privilege	The principle that a security architecture should be designed so that each entity is granted the minimum system resources and authorizations that the entity needs to perform its function.

local access	Access to an organizational system by a user (or process acting on behalf of a user) communicating through a direct connection without the use of a network.
malicious code	Software or firmware intended to perform an unauthorized process that will have adverse impact on the confidentiality, integrity, or availability of a system. A virus, worm, Trojan horse, or other code-based entity that infects a host. Spyware and some forms of adware are also examples of malicious code.
media [FIPS 200]	Physical devices or writing surfaces including, but not limited to, magnetic tapes, optical disks, magnetic disks, Large-Scale Integration (LSI) memory chips, and printouts (but not including display media) onto which information is recorded, stored, or printed within a system.
mobile code	Software programs or parts of programs obtained from remote systems, transmitted across a network, and executed on a local system without explicit installation or execution by the recipient.
mobile device	A portable computing device that has a small form factor such that it can easily be carried by a single individual; is designed to operate without a physical connection (e.g., wirelessly transmit or receive information); possesses local, non-removable/removable data storage; and includes a self-contained power source. Mobile devices may also include voice communication capabilities, on-board sensors that allow the devices to capture information, or built-in features that synchronize local data with remote locations. Examples include smartphones, tablets, and E-readers.
multifactor authentication	Authentication using two or more different factors to achieve authentication. Factors include something you know (e.g., PIN, password); something you have (e.g., cryptographic identification device, token); or something you are (e.g., biometric). See also <i>Authenticator</i> .
nonfederal organization	An entity that owns, operates, or maintains a nonfederal system.
nonfederal system	A system that does not meet the criteria for a federal system.
network	A system implemented with a collection of interconnected components. Such components may include routers, hubs, cabling, telecommunications controllers, key distribution centers, and technical control devices.
network access	Access to a system by a user (or a process acting on behalf of a user) communicating through a network (e.g., local area network, wide area network, Internet).
nonlocal maintenance	Maintenance activities conducted by individuals communicating through a network, either an external network (e.g., the Internet) or an internal network.

on behalf of (an agency) [32 CFR Part 2002]	A situation that occurs when: (i) a non-executive branch entity uses or operates an information system or maintains or collects information for the purpose of processing, storing, or transmitting Federal information; and (ii) those activities are not incidental to providing a service or product to the government.
organization [FIPS 200, Adapted]	An entity of any size, complexity, or positioning within an organizational structure.
portable storage device	A system component that can be inserted into and removed from a system, and that is used to store data or information (e.g., text, video, audio, and/or image data). Such components are typically implemented on magnetic, optical, or solid state devices (e.g., floppy disks, compact/digital video disks, flash/thumb drives, external hard disk drives, and flash memory cards/drives that contain nonvolatile memory).
potential impact [FIPS 199]	The loss of confidentiality, integrity, or availability could be expected to have: (i) a <i>limited</i> adverse effect (FIPS Publication 199 low); (ii) a <i>serious</i> adverse effect (FIPS Publication 199 moderate); or (iii) a <i>severe</i> or <i>catastrophic</i> adverse effect (FIPS Publication 199 high) on organizational operations, organizational assets, or individuals.
privileged account	A system account with authorizations of a privileged user.
privileged user	A user that is authorized (and therefore, trusted) to perform security-relevant functions that ordinary users are not authorized to perform.
records	The recordings (automated and/or manual) of evidence of activities performed or results achieved (e.g., forms, reports, test results), which serve as a basis for verifying that the organization and the system are performing as intended. Also used to refer to units of related data fields (i.e., groups of data fields that can be accessed by a program and that contain the complete set of information on particular items).
remote access	Access to an organizational system by a user (or a process acting on behalf of a user) communicating through an external network (e.g., the Internet).
remote maintenance	Maintenance activities conducted by individuals communicating through an external network (e.g., the Internet).
replay resistance	Protection against the capture of transmitted authentication or access control information and its subsequent retransmission with the intent of producing an unauthorized effect or gaining unauthorized access.

risk [FIPS 200, Adapted]	<p>A measure of the extent to which an entity is threatened by a potential circumstance or event, and typically a function of: (i) the adverse impacts that would arise if the circumstance or event occurs; and (ii) the likelihood of occurrence.</p> <p>System-related security risks are those risks that arise from the loss of confidentiality, integrity, or availability of information or systems. Such risks reflect the potential adverse impacts to organizational operations, organizational assets, individuals, other organizations, and the Nation.</p>
risk assessment	<p>The process of identifying risks to organizational operations (including mission, functions, image, reputation), organizational assets, individuals, other organizations, and the Nation, resulting from the operation of a system.</p> <p>Part of risk management, incorporates threat and vulnerability analyses, and considers mitigations provided by security controls planned or in place. Synonymous with risk analysis.</p>
sanitization	<p>Actions taken to render data written on media unrecoverable by both ordinary and, for some forms of sanitization, extraordinary means.</p> <p>Process to remove information from media such that data recovery is not possible. It includes removing all classified labels, markings, and activity logs.</p>
security	<p>A condition that results from the establishment and maintenance of protective measures that enable an enterprise to perform its mission or critical functions despite risks posed by threats to its use of systems. Protective measures may involve a combination of deterrence, avoidance, prevention, detection, recovery, and correction that should form part of the enterprise's risk management approach.</p>
security assessment	<p>See <i>Security Control Assessment</i>.</p>
security control [FIPS 199, Adapted]	<p>A safeguard or countermeasure prescribed for a system or an organization designed to protect the confidentiality, integrity, and availability of its information and to meet a set of defined security requirements.</p>
security control assessment [CNSSI 4009, Adapted]	<p>The testing or evaluation of security controls to determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements for a system or organization.</p>
security domain [CNSSI 4009, Adapted]	<p>A domain that implements a security policy and is administered by a single authority.</p>
security functionality	<p>The security-related features, functions, mechanisms, services, procedures, and architectures implemented within organizational systems or the environments in which those systems operate.</p>

security functions	The hardware, software, or firmware of the system responsible for enforcing the system security policy and supporting the isolation of code and data on which the protection is based.
security relevance	Functions or mechanisms that are relied upon, directly or indirectly, to enforce a security policy that governs confidentiality, integrity, and availability protections.
split tunneling	The process of allowing a remote user or device to establish a non-remote connection with a system and simultaneously communicate via some other connection to a resource in an external network. This method of network access enables a user to access remote devices (e.g., a networked printer) at the same time as accessing uncontrolled networks.
supplemental guidance	Statements used to provide additional explanatory information for security controls or security control enhancements.
system	<i>See Information System.</i>
system component [NIST SP 800-128, Adapted]	A discrete, identifiable information technology asset (hardware, software, firmware) that represents a building block of a system. System components include commercial information technology products.
system security plan	A document that describes how an organization meets the security requirements for a system or how an organization plans to meet the requirements. In particular, the system security plan describes the system boundary; the environment in which the system operates; how the security requirements are implemented; and the relationships with or connections to other systems.
system service	A capability provided by a system that facilitates information processing, storage, or transmission.
threat [CNSSI 4009, Adapted]	Any circumstance or event with the potential to adversely impact organizational operations, organizational assets, individuals, other organizations, or the Nation through a system via unauthorized access, destruction, disclosure, modification of information, and/or denial of service.
user [CNSSI 4009, Adapted]	Individual, or (system) process acting on behalf of an individual, authorized to access a system.
whitelisting	A process used to identify software programs that are authorized to execute on a system or authorized Universal Resource Locators (URL)/websites.
wireless technology	Technology that permits the transfer of information between separated points without physical connection.

MAPPING TABLES

MAPPING SECURITY REQUIREMENTS TO SECURITY CONTROLS

Tables D-1 through D-14 provide a mapping of the security requirements to the relevant security controls in [NIST Special Publication 800-53](#). The mapping tables are included for informational purposes only and are not intended to convey or impart any additional security requirements beyond those requirements defined in [Chapter Three](#). Moreover, because the security controls were developed for federal agencies, the supplemental guidance associated with those controls may not be applicable to nonfederal organizations. In some cases, the relevant security controls include additional expectations beyond those required to protect CUI and have been tailored using the criteria in [Chapter Two](#). Only the portion of the security control relevant to the security requirement is applicable. The tables also include a secondary mapping of the security controls from Special Publication 800-53 to the relevant controls in [ISO/IEC 27001](#), Annex A. The NIST to ISO/IEC mapping is obtained from Special Publication 800-53, Appendix H. An asterisk (*) indicates that the ISO/IEC control does not fully satisfy the intent of the NIST control. It is also important to note that, due to the tailoring for CUI, satisfaction of a basic or derived security requirement does *not* mean that the corresponding security control or control enhancement from NIST Special Publication 800-53 has been met, since certain elements of the control or control enhancement that are not essential to protecting the confidentiality of CUI are not reflected in those requirements.

Organizations that have implemented or plan to implement the [NIST Framework for Improving Critical Infrastructure Cybersecurity](#) can use the mapping of the security requirements to the security controls in NIST Special Publication 800-53 and ISO/IEC 27001 to locate the equivalent controls in the categories and subcategories associated with the core functions of the Framework: identify, protect, detect, respond, and recover. The security control mapping information can be useful to organizations that wish to demonstrate compliance to the security requirements in the context of their established information security programs, when such programs have been built around the NIST or ISO/IEC security controls.

CONSISTENCY IN PUBLICATION CONTENT

NIST continues to update its publications over time to ensure that the content remains current and relevant for the communities that it serves. Since these updates are ongoing, there may be instances where the content referenced in this publication may be inconsistent with other NIST publications. For example, the names of selected security controls and control enhancements from [NIST Special Publication 800-53](#) in this Appendix reflect planned updates to that publication. This inconsistency is temporary and will be resolved when the referenced publication is finalized.

TABLE D-1: MAPPING ACCESS CONTROL REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.1 ACCESS CONTROL					
Basic Security Requirements					
3.1.1 Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems). 3.1.2 Limit system access to the types of transactions and functions that authorized users are permitted to execute.	AC-2	Account Management	A.9.2.1	User registration and de-registration	
			A.9.2.2	User access provisioning	
			A.9.2.3	Management of privileged access rights	
			A.9.2.5	Review of user access rights	
			A.9.2.6	Removal or adjustment of access rights	
	AC-3	Access Enforcement	A.6.2.2	Teleworking	
			A.9.1.2	Access to networks and network services	
			A.9.4.1	Information access restriction	
			A.9.4.4	Use of privileged utility programs	
			A.9.4.5	Access control to program source code	
			A.13.1.1	Network controls	
			A.14.1.2	Securing application services on public networks	
			A.14.1.3	Protecting application services transactions	
	AC-17	Remote Access	A.18.1.3	Protection of records	
			A.6.2.1	Mobile device policy	
			A.6.2.2	Teleworking	
			A.13.1.1	Network controls	
			A.13.2.1	Information transfer policies and procedures	
	A.14.1.2	Securing application services on public networks			
Derived Security Requirements					
3.1.3 Control the flow of CUI in accordance with approved authorizations.	AC-4	Information Flow Enforcement	A.13.1.3	Segregation in networks	
			A.13.2.1	Information transfer policies and procedures	

SECURITY REQUIREMENTS	NIST SP 800-53 <i>Relevant Security Controls</i>		ISO/IEC 27001 <i>Relevant Security Controls</i>	
			A.14.1.2	Securing application services on public networks
			A.14.1.3	Protecting application services transactions
3.1.4 Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	AC-5	Separation of Duties	A.6.1.2	Segregation of duties
3.1.5 Employ the principle of least privilege, including for specific security functions and privileged accounts.	AC-6	Least Privilege	A.9.1.2	Access to networks and network services
			A.9.2.3	Management of privileged access rights
			A.9.4.4	Use of privileged utility programs
			A.9.4.5	Access control to program source code
	AC-6(1)	Least Privilege <i>Authorize Access to Security Functions</i>	No direct mapping.	
	AC-6(5)	Least Privilege <i>Privileged Accounts</i>	No direct mapping.	
3.1.6 Use non-privileged accounts or roles when accessing nonsecurity functions.	AC-6(2)	Least Privilege <i>Non-Privileged Access for Nonsecurity Functions</i>	No direct mapping.	
3.1.7 Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	AC-6(9)	Least Privilege <i>Log Use of Privileged Functions</i>	No direct mapping.	
	AC-6(10)	Least Privilege <i>Prohibit Non-Privileged Users from Executing Privileged Functions</i>	No direct mapping.	
3.1.8 Limit unsuccessful logon attempts.	AC-7	Unsuccessful Logon Attempts	A.9.4.2	Secure logon procedures
3.1.9 Provide privacy and security notices consistent with applicable CUI rules.	AC-8	System Use Notification	A.9.4.2	Secure logon procedures
3.1.10 Use session lock with pattern-hiding displays to prevent access and viewing of data after a period of inactivity.	AC-11	Session Lock	A.11.2.8	Unattended user equipment
			A.11.2.9	Clear desk and clear screen policy
	AC-11(1)	Session Lock <i>Pattern-Hiding Displays</i>	No direct mapping.	
3.1.11 Terminate (automatically) a user session after a defined condition.	AC-12	Session Termination	No direct mapping.	
3.1.12 Monitor and control remote access sessions.	AC-17(1)	Remote Access <i>Automated Monitoring / Control</i>	No direct mapping.	

SECURITY REQUIREMENTS	NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.1.13 Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	AC-17(2)	Remote Access <i>Protection of Confidentiality / Integrity Using Encryption</i>	No direct mapping.	
3.1.14 Route remote access via managed access control points.	AC-17(3)	Remote Access <i>Managed Access Control Points</i>	No direct mapping.	
3.1.15 Authorize remote execution of privileged commands and remote access to security-relevant information.	AC-17(4)	Remote Access <i>Privileged Commands / Access</i>	No direct mapping.	
3.1.16 Authorize wireless access prior to allowing such connections.	AC-18	Wireless Access	A.6.2.1	Mobile device policy
			A.13.1.1	Network controls
			A.13.2.1	Information transfer policies and procedures
3.1.17 Protect wireless access using authentication and encryption.	AC-18(1)	Wireless Access <i>Authentication and Encryption</i>	No direct mapping.	
3.1.18 Control connection of mobile devices.	AC-19	Access Control for Mobile Devices	A.6.2.1	Mobile device policy
			A.11.2.6	Security of equipment and assets off-premises
			A.13.2.1	Information transfer policies and procedures
3.1.19 Encrypt CUI on mobile devices and mobile computing platforms.	AC-19(5)	Access Control for Mobile Devices <i>Full Device / Container-Based Encryption</i>	No direct mapping.	
3.1.20 Verify and control/limit connections to and use of external systems.	AC-20	Use of External Systems	A.11.2.6	Security of equipment and assets off-premises
			A.13.1.1	Network controls
			A.13.2.1	Information transfer policies and procedures
	AC-20(1)	Use of External Systems <i>Limits on Authorized Use</i>	No direct mapping.	
3.1.21 Limit use of portable storage devices on external systems.	AC-20(2)	Use of External Systems <i>Portable Storage Devices</i>	No direct mapping.	
3.1.22 Control CUI posted or processed on publicly accessible systems.	AC-22	Publicly Accessible Content	No direct mapping.	
Shortcut to CUI Access Control Requirements				

TABLE D-2: MAPPING AWARENESS AND TRAINING REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.2 AWARENESS AND TRAINING					
Basic Security Requirements					
3.2.1	Ensure that managers, systems administrators, and users of organizational systems are made aware of the security risks associated with their activities and of the applicable policies, standards, and procedures related to the security of those systems.	AT-2	Security Awareness Training	A.7.2.2	Information security awareness, education, and training
				A.12.2.1	Controls against malware
3.2.2	Ensure that personnel are trained to carry out their assigned information security-related duties and responsibilities.	AT-3	Role-Based Security Training	A.7.2.2*	Information security awareness, education, and training
Derived Security Requirements					
3.2.3	Provide security awareness training on recognizing and reporting potential indicators of insider threat.	AT-2(2)	Security Awareness Training Insider Threat	No direct mapping.	
Shortcut to CUI Awareness and Training Requirements					

TABLE D-3: MAPPING AUDIT AND ACCOUNTABILITY REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.3 AUDIT AND ACCOUNTABILITY					
Basic Security Requirements					
3.3.1	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	AU-2	Event Logging	No direct mapping.	
		AU-3	Content of Audit Records	A.12.4.1*	Event logging
		AU-3(1)	Content of Audit Records Additional Audit Information	No direct mapping.	
3.3.2	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	AU-6	Audit Record Review, Analysis, and Reporting	A.12.4.1	Event logging
				A.16.1.2	Reporting information security events
				A.16.1.4	Assessment of and decision on information security events
		AU-11	Audit Record Retention	A.12.4.1	Event logging
				A.12.4.3	Administrator and operator logs
		AU-12	Audit Record Generation	A.12.4.1	Event logging
A.16.1.7	Collection of evidence				
Derived Security Requirements					
3.3.3	Review and update logged events.	AU-2(3)	Event Logging Reviews and Updates	No direct mapping.	
3.3.4	Alert in the event of an audit logging process failure.	AU-5	Response to Audit Logging Process Failures	No direct mapping.	
3.3.5	Correlate audit record review, analysis, and reporting processes for investigation and response to indications of unlawful, unauthorized, suspicious, or unusual activity.	AU-6(3)	Audit Record Review, Analysis, and Reporting Correlate Audit Record Repositories	No direct mapping.	
3.3.6	Provide audit record reduction and report generation to support on-demand analysis and reporting.	AU-7	Audit Record Reduction and Report Generation	No direct mapping.	
3.3.7	Provide a system capability that compares and synchronizes internal system clocks with an authoritative source to generate time stamps for audit records.	AU-8	Time Stamps	A.12.4.4	Clock synchronization
		AU-8(1)	Time Stamps Synchronization with Authoritative Time Source	No direct mapping.	
3.3.8	Protect audit information and audit logging tools from	AU-9	Protection of Audit Information	A.12.4.2	Protection of log information

SECURITY REQUIREMENTS		NIST SP 800-53 <i>Relevant Security Controls</i>	ISO/IEC 27001 <i>Relevant Security Controls</i>
unauthorized access, modification, and deletion.			A.12.4.3 Administrator and operator logs
3.3.9 Limit management of audit logging functionality to a subset of privileged users.	AU-9(4)	Protection of Audit Information <i>Access by Subset of Privileged Users</i>	A.18.1.3 Protection of records <i>No direct mapping.</i>
Shortcut to CUI Audit and Accountability Requirements			

TABLE D-4: MAPPING CONFIGURATION MANAGEMENT REQUIREMENTS TO CONTROLS²⁹

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.4 CONFIGURATION MANAGEMENT					
Basic Security Requirements					
3.4.1	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	CM-2	Baseline Configuration	No direct mapping.	
		CM-6	Configuration Settings	No direct mapping.	
		CM-8	System Component Inventory	A.8.1.1	Inventory of assets
				A.8.1.2	Ownership of assets
3.4.2	Establish and enforce security configuration settings for information technology products employed in organizational systems.	CM-8(1)	System Component Inventory Updates During Installations / Removals	No direct mapping.	
Derived Security Requirements					
3.4.3	Track, review, approve or disapprove, and log changes to organizational systems.	CM-3	Configuration Change Control	A.12.1.2	Change management
				A.14.2.2	System change control procedures
				A.14.2.3	Technical review of applications after operating platform changes
				A.14.2.4	Restrictions on changes to software packages
3.4.4	Analyze the security impact of changes prior to implementation.	CM-4	Security Impact Analysis	A.14.2.3	Technical review of applications after operating platform changes
3.4.5	Define, document, approve, and enforce physical and logical access restrictions associated with changes to organizational systems.	CM-5	Access Restrictions for Change	A.9.2.3	Management of privileged access rights
				A.9.4.5	Access control to program source code
				A.12.1.2	Change management
				A.12.1.4	Separation of development, testing, and operational environments
				A.12.5.1	Installation of software on operational systems

²⁹ CM-7(5), the least functionality whitelisting policy, is listed as an alternative to CM-7(4), the least functionality blacklisting policy, for organizations desiring greater protection for systems containing CUI. CM-7(5) is only required in federal systems at the high security control baseline in accordance with NIST Special Publication 800-53.

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	CM-7	Least Functionality	A.12.5.1*	Installation of software on operational systems
3.4.7	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	CM-7(1)	Least Functionality Periodic Review	No direct mapping.	
		CM-7(2)	Least Functionality Prevent program execution	No direct mapping.	
3.4.8	Apply deny-by-exception (blacklisting) policy to prevent the use of unauthorized software or deny-all, permit-by-exception (whitelisting) policy to allow the execution of authorized software.	CM-7(4)	Least Functionality Unauthorized Software/ Blacklisting	No direct mapping.	
		CM-7(5)	Least Functionality Authorized Software/ Whitelisting	No direct mapping.	
3.4.9	Control and monitor user-installed software.	CM-11	User-Installed Software	A.12.5.1	Installation of software on operational systems
				A.12.6.2	Restrictions on software installation
Shortcut to CUI Configuration Management Requirements					

TABLE D-5: MAPPING IDENTIFICATION AND AUTHENTICATION REQUIREMENTS TO CONTROLS³⁰

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.5 IDENTIFICATION AND AUTHENTICATION					
Basic Security Requirements					
3.5.1	Identify system users, processes acting on behalf of users, and devices.	IA-2	Identification and Authentication (Organizational Users)	A.9.2.1	User registration and de-registration
3.5.2	Authenticate (or verify) the identities of users, processes, or devices, as a prerequisite to allowing access to organizational systems.	IA-3	Device Identification and Authentication	No direct mapping.	
		IA-5	Authenticator Management	A.9.2.1	User registration and de-registration
				A.9.2.4	Management of secret authentication information of users
				A.9.3.1	Use of secret authentication information
		A.9.4.3	Password management system		
Derived Security Requirements					
3.5.3	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	IA-2(1)	Identification and Authentication (Organizational Users) Network Access to Privileged Accounts	No direct mapping.	
		IA-2(2)	Identification and Authentication (Organizational Users) Network Access to Non-Privileged Accounts	No direct mapping.	
		IA-2(3)	Identification and Authentication (Organizational Users) Local Access to Privileged Accounts	No direct mapping.	
3.5.4	Employ replay-resistant authentication mechanisms for network access to privileged and non-privileged accounts.	IA-2(8)	Identification and Authentication (Organizational Users) Network Access to Privileged Accounts-Replay Resistant	No direct mapping.	
		IA-2(9)	Identification and Authentication (Organizational Users) Network Access to Non-Privileged Accounts-Replay Resistant	No direct mapping.	

³⁰ IA-2(9) is *not* currently in the NIST Special Publication 800-53 moderate security control baseline although it will be added to the baseline in the next update. Employing multifactor authentication without a replay-resistant capability for non-privileged accounts creates a significant vulnerability for systems transmitting CUI.

SECURITY REQUIREMENTS		NIST SP 800-53 <i>Relevant Security Controls</i>		ISO/IEC 27001 <i>Relevant Security Controls</i>	
3.5.5	Prevent reuse of identifiers for a defined period.	IA-4	Identifier Management	A.9.2.1	User registration and de-registration
3.5.6	Disable identifiers after a defined period of inactivity.	IA-4	Identifier Management	A.9.2.1	User registration and de-registration
3.5.7	Enforce a minimum password complexity and change of characters when new passwords are created.	IA-5(1)	Authenticator Management <i>Password-Based Authentication</i>	<i>No direct mapping.</i>	
3.5.8	Prohibit password reuse for a specified number of generations.				
3.5.9	Allow temporary password use for system logons with an immediate change to a permanent password.				
3.5.10	Store and transmit only cryptographically-protected passwords.				
3.5.11	Obscure feedback of authentication information.	IA-6	Authenticator Feedback	A.9.4.2	Secure logon procedures
Shortcut to CUI Identification and Authentication Requirements					

TABLE D-6: MAPPING INCIDENT RESPONSE REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.6 INCIDENT RESPONSE					
Basic Security Requirements					
3.6.1 Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities. 3.6.2 Track, document, and report incidents to designated officials and/or authorities both internal and external to the organization.	IR-2	Incident Response Training	A.7.2.2*	Information security awareness, education, and training	
	IR-4	Incident Handling	A.16.1.4	Assessment of and decision on information security events	
			A.16.1.5	Response to information security incidents	
			A.16.1.6	Learning from information security incidents	
	IR-5	Incident Monitoring	No direct mapping.		
	IR-6	Incident Reporting	A.6.1.3	Contact with authorities	
			A.16.1.2	Reporting information security events	
	IR-7	Incident Response Assistance	No direct mapping.		
Derived Security Requirements					
3.6.3 Test the organizational incident response capability.	IR-3	Incident Response Testing	No direct mapping.		
Shortcut to CUI Incident Response Requirements					

TABLE D-7: MAPPING MAINTENANCE REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.7 MAINTENANCE					
Basic Security Requirements					
3.7.1 Perform maintenance on organizational systems. 3.7.2 Provide controls on the tools, techniques, mechanisms, and personnel used to conduct system maintenance.	MA-2	Controlled Maintenance	A.11.2.4*	Equipment maintenance	
			A.11.2.5*	Removal of assets	
	MA-3	Maintenance Tools	No direct mapping.		
	MA-3(1)	Maintenance Tools Inspect Tools	No direct mapping.		
	MA-3(2)	Maintenance Tools Inspect media	No direct mapping.		
Derived Security Requirements					
3.7.3 Ensure equipment removed for off-site maintenance is sanitized of any CUI.	MA-2	Controlled Maintenance	A.11.2.4*	Equipment maintenance	
			A.11.2.5*	Removal of assets	
3.7.4 Check media containing diagnostic and test programs for malicious code before the media are used in organizational systems.	MA-3(2)	Maintenance Tools	No direct mapping.		
3.7.5 Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	MA-4	Nonlocal Maintenance	No direct mapping.		
3.7.6 Supervise the maintenance activities of maintenance personnel without required access authorization.	MA-5	Maintenance Personnel	No direct mapping.		
Shortcut to CUI Maintenance Requirements					

TABLE D-8: MAPPING MEDIA PROTECTION REQUIREMENTS TO CONTROLS³¹

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.8 MEDIA PROTECTION					
Basic Security Requirements					
3.8.1	Protect (i.e., physically control and securely store) system media containing CUI, both paper and digital.	MP-2	Media Access	A.8.2.3	Handling of Assets
				A.8.3.1	Management of removable media
				A.11.2.9	Clear desk and clear screen policy
3.8.2	Limit access to CUI on system media to authorized users.	MP-4	Media Storage	A.8.2.3	Handling of Assets
3.8.3	Sanitize or destroy system media containing CUI before disposal or release for reuse.			A.8.3.1	Management of removable media
				A.11.2.9	Clear desk and clear screen policy
		MP-6	Media Sanitization	A.8.2.3	Handling of Assets
				A.8.3.1	Management of removable media
A.8.3.2	Disposal of media				
A.11.2.7	Secure disposal or reuse of equipment				
Derived Security Requirements					
3.8.4	Mark media with necessary CUI markings and distribution limitations.	MP-3	Media Marking	A.8.2.2	Labelling of Information
3.8.5	Control access to media containing CUI and maintain accountability for media during transport outside of controlled areas.	MP-5	Media Transport	A.8.2.3	Handling of Assets
				A.8.3.1	Management of removable media
				A.8.3.3	Physical media transfer
				A.11.2.5	Removal of assets
				A.11.2.6	Security of equipment and assets off-premises
3.8.6	Implement cryptographic mechanisms to protect the confidentiality of CUI stored on digital media during transport unless otherwise protected by alternative physical safeguards.	MP-5(4)	Media Transport Cryptographic Protection	No direct mapping.	
3.8.7	Control the use of removable media on system components.	MP-7	Media Use	A.8.2.3	Handling of Assets
				A.8.3.1	Management of removable media

³¹ CP-9, *Information System Backup*, is included with the Media Protection family since the Contingency Planning family was not included in the security requirements.

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.8.8	Prohibit the use of portable storage devices when such devices have no identifiable owner.	MP-7(1)	Media Use <i>Prohibit Use Without Owner</i>	No direct mapping.	
3.8.9	Protect the confidentiality of backup CUI at storage locations.	CP-9	System Backup	A.12.3.1	Information backup
				A.17.1.2	Implementing information security continuity
				A.18.1.3	Protection of records
Shortcut to CUI Media Protection Requirements					

TABLE D-9: MAPPING PERSONNEL SECURITY REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.9 PERSONNEL SECURITY					
Basic Security Requirements					
3.9.1	Screen individuals prior to authorizing access to organizational systems containing CUI.	PS-3	Personnel Screening	A.7.1.1	Screening
		PS-4	Personnel Termination	A.7.3.1	Termination or change of employment responsibilities
3.9.2	Ensure that organizational systems containing CUI are protected during and after personnel actions such as terminations and transfers.			PS-5	Personnel Transfer
		A.7.3.1	Termination or change of employment responsibilities		
				A.8.1.4	Return of assets
Derived Security Requirements		None.			
Shortcut to CUI Personnel Security Requirements					

TABLE D-10: MAPPING PHYSICAL PROTECTION REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.10 PHYSICAL PROTECTION					
Basic Security Requirements					
3.10.1 Limit physical access to organizational systems, equipment, and the respective operating environments to authorized individuals. 3.10.2 Protect and monitor the physical facility and support infrastructure for organizational systems.	PE-2	Physical Access Authorizations	A.11.1.2*	Physical entry controls	
	PE-4	Access Control for Transmission Medium	A.11.1.2	Physical entry controls	
			A.11.2.3	Cabling security	
	PE-5	Access Control for Output Devices	A.11.1.2	Physical entry controls	
			A.11.1.3	Securing offices, rooms, and facilities	
PE-6	Monitoring Physical Access	No direct mapping.			
Derived Security Requirements					
3.10.3 Escort visitors and monitor visitor activity.	PE-3	Physical Access Control	A.11.1.1	Physical security perimeter	
3.10.4 Maintain audit logs of physical access.			A.11.1.2	Physical entry controls	
			A.11.1.3	Securing offices, rooms, and facilities	
3.10.5 Control and manage physical access devices.					
3.10.6 Enforce safeguarding measures for CUI at alternate work sites.	PE-17	Alternate Work Site	A.6.2.2	Teleworking	
			A.11.2.6	Security of equipment and assets off-premises	
			A.13.2.1	Information transfer policies and procedures	
Shortcut to CUI Physical Protection Requirements					

TABLE D-11: MAPPING RISK ASSESSMENT REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.11 RISK ASSESSMENT					
Basic Security Requirements					
3.11.1	Periodically assess the risk to organizational operations (including mission, functions, image, or reputation), organizational assets, and individuals, resulting from the operation of organizational systems and the associated processing, storage, or transmission of CUI.	RA-3	Risk Assessment	A.12.6.1*	Management of technical vulnerabilities
Derived Security Requirements					
3.11.2	Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting those systems and applications are identified.	RA-5	Vulnerability Scanning	A.12.6.1*	Management of technical vulnerabilities
		RA-5(5)	Vulnerability Scanning <i>Privileged Access</i>	<i>No direct mapping.</i>	
3.11.3	Remediate vulnerabilities in accordance with risk assessments.	RA-5	Vulnerability Scanning	A.12.6.1*	Management of technical vulnerabilities
Shortcut to CUI Risk Assessment Requirements					

TABLE D-12: MAPPING SECURITY ASSESSMENT REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.12 SECURITY ASSESSMENT					
Basic Security Requirements					
3.12.1 Periodically assess the security controls in organizational systems to determine if the controls are effective in their application.	CA-2	Security Assessments	A.14.2.8	System security testing	
			A.18.2.2	Compliance with security policies and standards	
			A.18.2.3	Technical compliance review	
3.12.2 Develop and implement plans of action designed to correct deficiencies and reduce or eliminate vulnerabilities in organizational systems.	CA-5	Plan of Action and Milestones	No direct mapping.		
	CA-7	Continuous Monitoring	No direct mapping.		
	PL-2	System Security Plan	A.6.1.2	Information security coordination	
3.12.3 Monitor security controls on an ongoing basis to ensure the continued effectiveness of the controls.					
3.12.4 Develop, document, and periodically update system security plans that describe system boundaries, system environments of operation, how security requirements are implemented, and the relationships with or connections to other systems.					
Derived Security Requirements		None.			
Shortcut to CUI Security Assessment Requirements					

TABLE D-13: MAPPING SYSTEM AND COMMUNICATIONS PROTECTION REQUIREMENTS TO CONTROLS³²

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.13 SYSTEM AND COMMUNICATIONS PROTECTION					
Basic Security Requirements					
3.13.1 Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	SC-7	Boundary Protection	A.13.1.1	Network controls	
			A.13.1.3	Segregation in networks	
			A.13.2.1	Information transfer policies and procedures	
			A.14.1.3	Protecting application services transactions	
3.13.2 Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	SA-8	Security Engineering Principles	A.14.2.5	Secure system engineering principles	
Derived Security Requirements					
3.13.3 Separate user functionality from system management functionality.	SC-2	Application Partitioning	No direct mapping.		
3.13.4 Prevent unauthorized and unintended information transfer via shared system resources.	SC-4	Information in Shared Resources	No direct mapping.		
3.13.5 Implement subnetworks for publicly accessible system components that are physically or logically separated from internal networks.	SC-7	Boundary Protection	A.13.1.1	Network controls	
			A.13.1.3	Segregation in networks	
			A.13.2.1	Information transfer policies and procedures	
			A.14.1.3	Protecting application services transactions	
3.13.6 Deny network communications traffic by default and allow network communications traffic by exception (i.e., deny all, permit by exception).	SC-7(5)	Boundary Protection Deny by Default / Allow by Exception	No direct mapping.		

³² SA-8, *Security Engineering Principles*, is included with the System and Communications Protection family since the System and Services Acquisition family was not included in the security requirements.

SECURITY REQUIREMENTS	NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.13.7 Prevent remote devices from simultaneously establishing non-remote connections with organizational systems and communicating via some other connection to resources in external networks (i.e., split tunneling).	SC-7(7)	Boundary Protection <i>Prevent Split Tunneling for Remote Devices</i>	No direct mapping.	
3.13.8 Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	SC-8	Transmission Confidentiality and Integrity	A.8.2.3	Handling of Assets
			A.13.1.1	Network controls
			A.13.2.1	Information transfer policies and procedures
			A.13.2.3	Electronic messaging
			A.14.1.2	Securing application services on public networks
			A.14.1.3	Protecting application services transactions
	SC-8(1)	Transmission Confidentiality and Integrity <i>Cryptographic or Alternate Physical Protection</i>	No direct mapping.	
3.13.9 Terminate network connections associated with communications sessions at the end of the sessions or after a defined period of inactivity.	SC-10	Network Disconnect	A.13.1.1	Network controls
3.13.10 Establish and manage cryptographic keys for cryptography employed in organizational systems.	SC-12	Cryptographic Key Establishment and Management	A.10.1.2	Key Management
3.13.11 Employ FIPS-validated cryptography when used to protect the confidentiality of CUI.	SC-13	Cryptographic Protection	A.10.1.1	Policy on the use of cryptographic controls
			A.14.1.2	Securing application services on public networks
			A.14.1.3	Protecting application services transactions
			A.18.1.5	Regulation of cryptographic controls
3.13.12 Prohibit remote activation of collaborative computing devices and provide indication of devices in use to users present at the device.	SC-15	Collaborative Computing Devices	A.13.2.1*	Information transfer policies and procedures
3.13.13 Control and monitor the use of mobile code.	SC-18	Mobile Code	No direct mapping.	

SECURITY REQUIREMENTS		NIST SP 800-53 <i>Relevant Security Controls</i>	ISO/IEC 27001 <i>Relevant Security Controls</i>
3.13.14 Control and monitor the use of Voice over Internet Protocol (VoIP) technologies.	SC-19	Voice over Internet Protocol	<i>No direct mapping.</i>
3.13.15 Protect the authenticity of communications sessions.	SC-23	Session Authenticity	<i>No direct mapping.</i>
3.13.16 Protect the confidentiality of CUI at rest.	SC-28	Protection of Information at Rest	A.8.2.3* Handling of Assets
Shortcut to CUI System and Communications Protection Requirements			

TABLE D-14: MAPPING SYSTEM AND INFORMATION INTEGRITY REQUIREMENTS TO CONTROLS

SECURITY REQUIREMENTS		NIST SP 800-53 Relevant Security Controls		ISO/IEC 27001 Relevant Security Controls	
3.14 SYSTEM AND INFORMATION INTEGRITY					
Basic Security Requirements					
3.14.1 Identify, report, and correct system flaws in a timely manner. 3.14.2 Provide protection from malicious code at designated locations within organizational systems. 3.14.3 Monitor system security alerts and advisories and take action in response.	SI-2	Flaw Remediation	A.12.6.1	Management of technical vulnerabilities	
			A.14.2.2	System change control procedures	
			A.14.2.3	Technical review of applications after operating platform changes	
			A.16.1.3	Reporting information security weaknesses	
	SI-3	Malicious Code Protection	A.12.2.1	Controls against malware	
	SI-5	Security Alerts, Advisories, and Directives	A.6.1.4*	Contact with special interest groups	
Derived Security Requirements					
3.14.4 Update malicious code protection mechanisms when new releases are available.	SI-3	Malicious Code Protection	A.12.2.1	Controls against malware	
3.14.5 Perform periodic scans of organizational systems and real-time scans of files from external sources as files are downloaded, opened, or executed.					
3.14.6 Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	SI-4	System Monitoring	No direct mapping.		
	SI-4(4)	System Monitoring Inbound and Outbound Communications Traffic	No direct mapping.		
3.14.7 Identify unauthorized use of organizational systems.	SI-4	System Monitoring	No direct mapping.		
Shortcut to CUI System and Information Integrity Requirements					

APPENDIX E

TAILORING CRITERIA

LISTING OF MODERATE SECURITY CONTROL BASELINE AND TAILORING ACTIONS

This appendix provides a complete listing of the security controls in the [NIST Special Publication 800-53](#) moderate baseline, one of the sources along with [FIPS Publication 200](#), for the security requirements described in [Chapter Three](#). Tables E-1 through E-17 contain the tailoring actions (by family) that have been carried out on the security controls in the moderate baseline in accordance with the tailoring criteria established by NIST and NARA.³³ The tailoring actions facilitated the development of the CUI derived security requirements which supplement the basic security requirements obtained from the security requirements in FIPS Publication 200.³⁴

There are three primary criteria for eliminating a security control or control enhancement from the moderate baseline including—

- The control or control enhancement is uniquely federal (i.e., primarily the responsibility of the federal government);
- The control or control enhancement is not directly related to protecting the confidentiality of CUI;³⁵ or
- The control or control enhancement is expected to be routinely satisfied by nonfederal organizations without specification.³⁶

The following symbols are used in Tables E-1 through E-17 to specify the particular tailoring actions taken or when no tailoring actions were required.

TAILORING SYMBOL	TAILORING CRITERIA
NCO	NOT DIRECTLY RELATED TO PROTECTING THE CONFIDENTIALITY OF CUI.
FED	UNIQUELY FEDERAL, PRIMARILY THE RESPONSIBILITY OF THE FEDERAL GOVERNMENT.
NFO	EXPECTED TO BE ROUTINELY SATISFIED BY NONFEDERAL ORGANIZATIONS WITHOUT SPECIFICATION.
CUI	THE CUI BASIC OR DERIVED SECURITY REQUIREMENT IS REFLECTED IN AND IS TRACEABLE TO THE SECURITY CONTROL, CONTROL ENHANCEMENT, OR SPECIFIC ELEMENTS OF THE CONTROL/ENHANCEMENT.

³³ Organizations can use the information in Appendix E to build a CUI confidentiality *overlay* as defined in NIST Special Publication 800-53, Appendix I.

³⁴ The same *tailoring criteria* were applied to the security requirements in FIPS Publication 200 resulting in the CUI basic security requirements in described in Chapter Three and Appendix D.

³⁵ While the primary purpose of this publication is to define requirements to protect the confidentiality of CUI, there is a close relationship between the security objectives of confidentiality and integrity. Therefore, most of security controls in the NIST Special Publication 800-53 moderate baseline that support protection against unauthorized disclosure also support protection against unauthorized modification.

³⁶ The security controls tailored out of the moderate baseline in Special Publication 800-53 with regard to the protection of CUI (i.e., controls specifically marked as either NCO or NFO in Tables E-1 through E-17), are often included as part of an organization's comprehensive security program.

TABLE E-1: TAILORING ACTIONS FOR ACCESS CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
AC-1	Access Control Policy and Procedures	NFO
AC-2	Account Management	CUI
AC-2(1)	ACCOUNT MANAGEMENT / AUTOMATED SYSTEM ACCOUNT MANAGEMENT	NCO
AC-2(2)	ACCOUNT MANAGEMENT / REMOVAL OF TEMPORARY / EMERGENCY ACCOUNTS	NCO
AC-2(3)	ACCOUNT MANAGEMENT / DISABLE INACTIVE ACCOUNTS	NCO
AC-2(4)	ACCOUNT MANAGEMENT / AUTOMATED AUDIT ACTIONS	NCO
AC-3	Access Enforcement	CUI
AC-4	Information Flow Enforcement	CUI
AC-5	Separation of Duties	CUI
AC-6	Least Privilege	CUI
AC-6(1)	LEAST PRIVILEGE / AUTHORIZE ACCESS TO SECURITY FUNCTIONS	CUI
AC-6(2)	LEAST PRIVILEGE / NON-PRIVILEGED ACCESS FOR NONSECURITY FUNCTIONS	CUI
AC-6(5)	LEAST PRIVILEGE / PRIVILEGED ACCOUNTS	CUI
AC-6(9)	LEAST PRIVILEGE / AUDITING USE OF PRIVILEGED FUNCTIONS	CUI
AC-6(10)	LEAST PRIVILEGE / PROHIBIT NON-PRIVILEGED USERS FROM EXECUTING PRIVILEGED FUNCTIONS	CUI
AC-7	Unsuccessful Logon Attempts	CUI
AC-8	System Use Notification	CUI
AC-11	Session Lock	CUI
AC-11(1)	SESSION LOCK / PATTERN-HIDING DISPLAYS	CUI
AC-12	Session Termination	CUI
AC-14	Permitted Actions without Identification or Authentication	FED
AC-17	Remote Access	CUI
AC-17(1)	REMOTE ACCESS / AUTOMATED MONITORING / CONTROL	CUI
AC-17(2)	REMOTE ACCESS / PROTECTION OF CONFIDENTIALITY / INTEGRITY USING ENCRYPTION	CUI
AC-17(3)	REMOTE ACCESS / MANAGED ACCESS CONTROL POINTS	CUI
AC-17(4)	REMOTE ACCESS / PRIVILEGED COMMANDS / ACCESS	CUI
AC-18	Wireless Access	CUI
AC-18(1)	WIRELESS ACCESS / AUTHENTICATION AND ENCRYPTION	CUI
AC-19	Access Control for Mobile Devices	CUI
AC-19(5)	ACCESS CONTROL FOR MOBILE DEVICES / FULL DEVICE / CONTAINER-BASED ENCRYPTION	CUI
AC-20	Use of External Systems	CUI
AC-20(1)	USE OF EXTERNAL SYSTEMS / LIMITS ON AUTHORIZED USE	CUI
AC-20(2)	USE OF EXTERNAL SYSTEMS / PORTABLE STORAGE DEVICES	CUI
AC-21	Information Sharing	FED
AC-22	Publicly Accessible Content	CUI

TABLE E-2: TAILORING ACTIONS FOR AWARENESS AND TRAINING CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
AT-1	Security Awareness and Training Policy and Procedures	NFO
AT-2	Security Awareness Training	CUI
AT-2(2)	<i>SECURITY AWARENESS / INSIDER THREAT</i>	CUI
AT-3	Role-Based Security Training	CUI
AT-4	Security Training Records	NFO

TABLE E-3: TAILORING ACTIONS FOR AUDITING AND ACCOUNTABILITY CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
AU-1	Audit and Accountability Policy and Procedures	NFO
AU-2	Audit Events	CUI
AU-2(3)	<i>AUDIT EVENTS / REVIEWS AND UPDATES</i>	CUI
AU-3	Content of Audit Records	CUI
AU-3(1)	<i>CONTENT OF AUDIT RECORDS / ADDITIONAL AUDIT INFORMATION</i>	CUI
AU-4	Audit Storage Capacity	NCO
AU-5	Response to Audit Logging Process Failures	CUI
AU-6	Audit Review, Analysis, and Reporting	CUI
AU-6(1)	<i>AUDIT REVIEW, ANALYSIS, AND REPORTING / PROCESS INTEGRATION</i>	NCO
AU-6(3)	<i>AUDIT REVIEW, ANALYSIS, AND REPORTING / CORRELATE AUDIT REPOSITORIES</i>	CUI
AU-7	Audit Reduction and Report Generation	CUI
AU-7(1)	<i>AUDIT REDUCTION AND REPORT GENERATION / AUTOMATIC PROCESSING</i>	NCO
AU-8	Time Stamps	CUI
AU-8(1)	<i>TIME STAMPS / SYNCHRONIZATION WITH AUTHORITATIVE TIME SOURCE</i>	CUI
AU-9	Protection of Audit Information	CUI
AU-9(4)	<i>PROTECTION OF AUDIT INFORMATION / ACCESS BY SUBSET OF PRIVILEGED USERS</i>	CUI
AU-11	Audit Record Retention	NCO
AU-12	Audit Generation	CUI

TABLE E-4: TAILORING ACTIONS FOR SECURITY ASSESSMENT AND AUTHORIZATION CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
CA-1	Security Assessment and Authorization Policies and Procedures	NFO
CA-2	Security Assessments	CUI
CA-2(1)	<i>SECURITY ASSESSMENTS / INDEPENDENT ASSESSORS</i>	NFO
CA-3	System Interconnections	NFO
CA-3(5)	<i>SYSTEM INTERCONNECTIONS / RESTRICTIONS ON EXTERNAL SYSTEM CONNECTIONS</i>	NFO
CA-5	Plan of Action and Milestones	CUI
CA-6	Security Authorization	FED
CA-7	Continuous Monitoring	CUI
CA-7(1)	<i>CONTINUOUS MONITORING / INDEPENDENT ASSESSMENT</i>	NFO
CA-9	Internal System Connections	NFO

TABLE E-5: TAILORING ACTIONS FOR CONFIGURATION MANAGEMENT CONTROLS³⁷

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
CM-1	Configuration Management Policy and Procedures	NFO
CM-2	Baseline Configuration	CUI
CM-2(1)	<i>BASELINE CONFIGURATION / REVIEWS AND UPDATES</i>	NFO
CM-2(3)	<i>BASELINE CONFIGURATION / RETENTION OF PREVIOUS CONFIGURATIONS</i>	NCO
CM-2(7)	<i>BASELINE CONFIGURATION / CONFIGURE SYSTEMS, COMPONENTS, OR DEVICES FOR HIGH-RISK AREAS</i>	NFO
CM-3	Configuration Change Control	CUI
CM-3(2)	<i>CONFIGURATION CHANGE CONTROL / TEST / VALIDATE / DOCUMENT CHANGES</i>	NFO
CM-4	Security Impact Analysis	CUI
CM-5	Access Restrictions for Change	CUI
CM-6	Configuration Settings	CUI
CM-7	Least Functionality	CUI
CM-7(1)	<i>LEAST FUNCTIONALITY / PERIODIC REVIEW</i>	CUI
CM-7(2)	<i>LEAST FUNCTIONALITY / PREVENT PROGRAM EXECUTION</i>	CUI
CM-7(4)(5)	<i>LEAST FUNCTIONALITY / UNAUTHORIZED OR AUTHORIZED SOFTWARE / BLACKLISTING OR WHITELISTING</i>	CUI
CM-8	System Component Inventory	CUI
CM-8(1)	<i>SYSTEM COMPONENT INVENTORY / UPDATES DURING INSTALLATIONS / REMOVALS</i>	CUI
CM-8(3)	<i>SYSTEM COMPONENT INVENTORY / AUTOMATED UNAUTHORIZED COMPONENT DETECTION</i>	NCO
CM-8(5)	<i>SYSTEM COMPONENT INVENTORY / NO DUPLICATE ACCOUNTING OF COMPONENTS</i>	NFO
CM-9	Configuration Management Plan	NFO
CM-10	Software Usage Restrictions	NCO
CM-11	User-Installed Software	CUI

³⁷ CM-7(5), Least Functionality *whitelisting*, is not in the moderate security control baseline in accordance with NIST Special Publication 800-53. However, it is offered as an optional and stronger policy alternative to *blacklisting*.

TABLE E-6: TAILORING ACTIONS FOR CONTINGENCY PLANNING CONTROLS³⁸

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
CP-1	Contingency Planning Policy and Procedures	NCO
CP-2	Contingency Plan	NCO
CP-2(1)	<i>CONTINGENCY PLAN / COORDINATE WITH RELATED PLANS</i>	NCO
CP-2(3)	<i>CONTINGENCY PLAN / RESUME ESSENTIAL MISSIONS / BUSINESS FUNCTIONS</i>	NCO
CP-2(8)	<i>CONTINGENCY PLAN / IDENTIFY CRITICAL ASSETS</i>	NCO
CP-3	Contingency Training	NCO
CP-4	Contingency Plan Testing	NCO
CP-4(1)	<i>CONTINGENCY PLAN TESTING / COORDINATE WITH RELATED PLANS</i>	NCO
CP-6	Alternate Storage Site	NCO
CP-6(1)	<i>ALTERNATE STORAGE SITE / SEPARATION FROM PRIMARY SITE</i>	NCO
CP-6(3)	<i>ALTERNATE STORAGE SITE / ACCESSIBILITY</i>	NCO
CP-7	Alternate Processing Site	NCO
CP-7(1)	<i>ALTERNATE PROCESSING SITE / SEPARATION FROM PRIMARY SITE</i>	NCO
CP-7(2)	<i>ALTERNATE PROCESSING SITE / ACCESSIBILITY</i>	NCO
CP-7(3)	<i>ALTERNATE PROCESSING SITE / PRIORITY OF SERVICE</i>	NCO
CP-8	Telecommunications Services	NCO
CP-8(1)	<i>TELECOMMUNICATIONS SERVICES / PRIORITY OF SERVICE PROVISIONS</i>	NCO
CP-8(2)	<i>TELECOMMUNICATIONS SERVICES / SINGLE POINTS OF FAILURE</i>	NCO
CP-9	System Backup	CUI
CP-9(1)	<i>SYSTEM BACKUP / TESTING FOR RELIABILITY / INTEGRITY</i>	NCO
CP-10	System Recovery and Reconstitution	NCO
CP-10(2)	<i>SYSTEM RECOVERY AND RECONSTITUTION / TRANSACTION RECOVERY</i>	NCO

³⁸ CP-9 is grouped with the security controls in the *Media Protection* family in Appendix D since the *Contingency Planning* family was not included in the security requirements.

TABLE E-7: TAILORING ACTIONS FOR IDENTIFICATION AND AUTHENTICATION CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
IA-1	Identification and Authentication Policy and Procedures	NFO
IA-2	Identification and Authentication (Organizational Users)	CUI
IA-2(1)	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS) / NETWORK ACCESS TO PRIVILEGED ACCOUNTS	CUI
IA-2(2)	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS) / NETWORK ACCESS TO NON-PRIVILEGED ACCOUNTS	CUI
IA-2(3)	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS) / LOCAL ACCESS TO PRIVILEGED ACCOUNTS	CUI
IA-2(8)	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS) / NETWORK ACCESS TO PRIVILEGED ACCOUNTS - REPLAY RESISTANT	CUI
IA-2(9)	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS) / NETWORK ACCESS TO NON-PRIVILEGED ACCOUNTS - REPLAY RESISTANT	CUI
IA-2(11)	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS) / REMOTE ACCESS - SEPARATE DEVICE	FED
IA-2(12)	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS) / ACCEPTANCE OF PIV CREDENTIALS	FED
IA-3	Device Identification and Authentication	CUI
IA-4	Identifier Management	CUI
IA-5	Authenticator Management	CUI
IA-5(1)	AUTHENTICATOR MANAGEMENT / PASSWORD-BASED AUTHENTICATION	CUI
IA-5(2)	AUTHENTICATOR MANAGEMENT / PKI-BASED AUTHENTICATION	FED
IA-5(3)	AUTHENTICATOR MANAGEMENT / IN-PERSON OR TRUSTED THIRD-PARTY REGISTRATION	FED
IA-5(11)	AUTHENTICATOR MANAGEMENT / HARDWARE TOKEN-BASED AUTHENTICATION	FED
IA-6	Authenticator Feedback	CUI
IA-7	Cryptographic Module Authentication	FED
IA-8	Identification and Authentication (Non-Organizational Users)	FED
IA-8(1)	IDENTIFICATION AND AUTHENTICATION (NON-ORGANIZATIONAL USERS) / ACCEPTANCE OF PIV CREDENTIALS FROM OTHER AGENCIES	FED
IA-8(2)	IDENTIFICATION AND AUTHENTICATION (NON-ORGANIZATIONAL USERS) / ACCEPTANCE OF THIRD-PARTY CREDENTIALS	FED
IA-8(3)	IDENTIFICATION AND AUTHENTICATION (NON-ORGANIZATIONAL USERS) / USE OF FICAM-APPROVED PRODUCTS	FED
IA-8(4)	IDENTIFICATION AND AUTHENTICATION (NON-ORGANIZATIONAL USERS) / USE OF FICAM-ISSUED PROFILES	FED

TABLE E-8: TAILORING ACTIONS FOR INCIDENT RESPONSE CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
IR-1	Incident Response Policy and Procedures	NFO
IR-2	Incident Response Training	CUI
IR-3	Incident Response Testing	CUI
IR-3(2)	<i>INCIDENT RESPONSE TESTING / COORDINATION WITH RELATED PLANS</i>	NCO
IR-4	Incident Handling	CUI
IR-4(1)	<i>INCIDENT HANDLING / AUTOMATED INCIDENT HANDLING PROCESSES</i>	NCO
IR-5	Incident Monitoring	CUI
IR-6	Incident Reporting	CUI
IR-6(1)	<i>INCIDENT REPORTING / AUTOMATED REPORTING</i>	NCO
IR-7	Incident Response Assistance	CUI
IR-7(1)	<i>INCIDENT RESPONSE ASSISTANCE / AUTOMATION SUPPORT FOR AVAILABILITY OF INFORMATION / SUPPORT</i>	NCO
IR-8	Incident Response Plan	NFO

TABLE E-9: TAILORING ACTIONS FOR MAINTENANCE CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
MA-1	System Maintenance Policy and Procedures	NFO
MA-2	Controlled Maintenance	CUI
MA-3	Maintenance Tools	CUI
MA-3(1)	<i>MAINTENANCE TOOLS / INSPECT TOOLS</i>	CUI
MA-3(2)	<i>MAINTENANCE TOOLS / INSPECT MEDIA</i>	CUI
MA-4	Nonlocal Maintenance	CUI
MA-4(2)	<i>NONLOCAL MAINTENANCE / DOCUMENT NONLOCAL MAINTENANCE</i>	NFO
MA-5	Maintenance Personnel	CUI
MA-6	Timely Maintenance	NCO

TABLE E-10: TAILORING ACTIONS FOR MEDIA PROTECTION CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
MP-1	Media Protection Policy and Procedures	NFO
MP-2	Media Access	CUI
MP-3	Media Marking	CUI
MP-4	Media Storage	CUI
MP-5	Media Transport	CUI
MP-5(4)	<i>MEDIA TRANSPORT / CRYPTOGRAPHIC PROTECTION</i>	CUI
MP-6	Media Sanitization	CUI
MP-7	Media Use	CUI
MP-7(1)	<i>MEDIA USE / PROHIBIT USE WITHOUT OWNER</i>	CUI

TABLE E-11: TAILORING ACTIONS FOR PHYSICAL AND ENVIRONMENTAL PROTECTION CONTROLS

NIST SP 800-53 MODERATE BASELINE SECURITY CONTROLS		TAILORING ACTION
PE-1	Physical and Environmental Protection Policy and Procedures	NFO
PE-2	Physical Access Authorizations	CUI
PE-3	Physical Access Control	CUI
PE-4	Access Control for Transmission Medium	CUI
PE-5	Access Control for Output Devices	CUI
PE-6	Monitoring Physical Access	CUI
PE-6(1)	<i>MONITORING PHYSICAL ACCESS / INTRUSION ALARMS / SURVEILLANCE EQUIPMENT</i>	NFO
PE-8	Visitor Access Records	NFO
PE-9	Power Equipment and Cabling	NCO
PE-10	Emergency Shutoff	NCO
PE-11	Emergency Power	NCO
PE-12	Emergency Lighting	NCO
PE-13	Fire Protection	NCO
PE-13(3)	<i>FIRE PROTECTION / AUTOMATIC FIRE SUPPRESSION</i>	NCO
PE-14	Temperature and Humidity Controls	NCO
PE-15	Water Damage Protection	NCO
PE-16	Delivery and Removal	NFO
PE-17	Alternate Work Site	CUI

APPENDIX F

DISCUSSION

IMPLEMENTING AND ASSESSING CUI SECURITY REQUIREMENTS

Tables F-1 through F-14 provide discussion intended to facilitate implementing and assessing the CUI security requirements in NIST Special Publication 800-171. This information is derived primarily from the security controls and discussion in NIST Special Publication 800-53. It is provided to give assessors a better understanding of the mechanisms and procedures used to implement the safeguards employed to protect CUI. The discussion is *not* intended to extend the security requirements or the scope of the assessments of those requirements. NIST publications identified in the following tables are available at <https://csrc.nist.gov/publications>.

TABLE F-1: DISCUSSION ON ACCESS CONTROL REQUIREMENTS

<u>3.1.1</u>	SECURITY REQUIREMENT Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).
	DISCUSSION Access control policies (e.g., identity- or role-based policies, control matrices, and cryptography) control access between active entities or subjects (i.e., users or processes acting on behalf of users) and passive entities or objects (e.g., devices, files, records, and domains) in systems. Access enforcement mechanisms can be employed at the application and service level to provide increased information security. Other systems include systems internal and external to the organization. This requirement focuses on account management for both systems and applications. The definition of and enforcement of access authorizations, other than those determined by account type (e.g., privileged versus non-privileged) are addressed in requirement <u>3.1.2</u> .
<u>3.1.2</u>	SECURITY REQUIREMENT Limit system access to the types of transactions and functions that authorized users are permitted to execute.
	DISCUSSION Organizations may choose to define access privileges or other attributes by account, by type of account, or a combination of both. System account types include, for example, individual, shared, group, system, guest/anonymous, emergency, developer/manufacturer/vendor, and temporary. Other attributes required for authorizing access include, for example: restrictions on time-of-day, day-of-week, and point-of-origin. In defining other account attributes, organizations may consider system-related requirements (e.g., scheduled maintenance, system upgrades) and mission or business requirements, (e.g., time zone differences, customer requirements, remote access to support travel requirements).
<u>3.1.3</u>	SECURITY REQUIREMENT Control the flow of CUI in accordance with approved authorizations.
	DISCUSSION Information flow control regulates where information can travel within a system and between systems (as opposed to who can access the information) and without explicit regard to subsequent accesses to that information. Flow control restrictions include, for example: keeping export-controlled information from being transmitted in the clear to the Internet; blocking outside traffic that claims to be from within the organization; restricting requests to the Internet that are not from

	<p>the internal web proxy server; and limiting information transfers between organizations based on data structures and content.</p> <p>Organizations commonly employ information flow control policies and enforcement mechanisms to control the flow of information between designated sources and destinations (e.g., networks, individuals, and devices) within systems and between interconnected systems. Flow control is based on characteristics of the information or the information path. Enforcement occurs in boundary protection devices (e.g., gateways, routers, guards, encrypted tunnels, firewalls) that employ rule sets or establish configuration settings that restrict system services, provide a packet-filtering capability based on header information, or message-filtering capability based on message content (e.g., implementing key word searches or using document characteristics). Organizations also consider the trustworthiness of filtering and inspection mechanisms (i.e., hardware, firmware, and software components) that are critical to information flow enforcement.</p> <p>Transferring information between systems representing different security domains with different security policies introduces risk that such transfers violate one or more domain security policies. In such situations, information owners/stewards provide guidance at designated policy enforcement points between interconnected systems. Organizations consider mandating specific architectural solutions when required to enforce specific security policies. Enforcement includes, for example: prohibiting information transfers between interconnected systems (i.e., allowing access only); employing hardware mechanisms to enforce one-way information flows; and implementing trustworthy regrading mechanisms to reassign security attributes and security labels.</p>
3.1.4	<p>SECURITY REQUIREMENT</p> <p>Separate the duties of individuals to reduce the risk of malevolent activity without collusion.</p>
	<p>DISCUSSION</p> <p>Separation of duties addresses the potential for abuse of authorized privileges and helps to reduce the risk of malevolent activity without collusion. Separation of duties includes, for example: dividing mission functions and system support functions among different individuals or roles; conducting system support functions with different individuals (e.g., system management, programming, configuration management, quality assurance and testing, and network security); and ensuring that security personnel administering access control functions do not also administer audit functions. Because separation of duty violations can span systems and application domains, organizations consider the entirety of organizational systems and system components when developing policy on separation of duties.</p>
3.1.5	<p>SECURITY REQUIREMENT</p> <p>Employ the principle of least privilege, including for specific security functions and privileged accounts.</p>
	<p>DISCUSSION</p> <p>Organizations employ the principle of least privilege for specific duties and authorized accesses for users and processes. The principle of least privilege is applied with the goal of authorized privileges no higher than necessary to accomplish required organizational missions or business functions. Organizations consider the creation of additional processes, roles, and system accounts as necessary, to achieve least privilege. Organizations also apply least privilege to the development, implementation, and operation of organizational systems. Security functions include, for example, establishing system accounts, setting events to be logged, setting intrusion detection parameters, and configuring access authorizations (i.e., permissions, privileges).</p> <p>Privileged accounts, including super user accounts, are typically described as system administrator for various types of commercial off-the-shelf operating systems. Restricting privileged accounts to specific personnel or roles prevents day-to-day users from having access to privileged information or functions. Organizations may differentiate in the application of this requirement between allowed privileges for local accounts and for domain accounts provided organizations retain the</p>

	ability to control system configurations for key security parameters and as otherwise necessary to sufficiently mitigate risk.
<u>3.1.6</u>	SECURITY REQUIREMENT Use non-privileged accounts or roles when accessing nonsecurity functions.
	DISCUSSION This requirement limits exposure when operating from within privileged accounts or roles. The inclusion of roles addresses situations where organizations implement access control policies such as role-based access control and where a change of role provides the same degree of assurance in the change of access authorizations for the user and all processes acting on behalf of the user as would be provided by a change between a privileged and non-privileged account.
<u>3.1.7</u>	SECURITY REQUIREMENT Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.
	DISCUSSION Privileged functions include, for example, establishing system accounts, performing system integrity checks, conducting patching operations, or administering cryptographic key management activities. Non-privileged users are individuals that do not possess appropriate authorizations. Circumventing intrusion detection and intrusion prevention mechanisms or malicious code protection mechanisms are examples of privileged functions that require protection from non-privileged users. Note that this requirement represents a condition to be achieved by the definition of authorized privileges in <u>3.1.2</u> . Misuse of privileged functions, either intentionally or unintentionally by authorized users, or by unauthorized external entities that have compromised system accounts, is a serious and ongoing concern and can have significant adverse impacts on organizations. Logging the use of privileged functions is one way to detect such misuse, and in doing so, help mitigate the risk from insider threats and the advanced persistent threat.
<u>3.1.8</u>	SECURITY REQUIREMENT Limit unsuccessful logon attempts.
	DISCUSSION This requirement applies regardless of whether the logon occurs via a local or network connection. Due to the potential for denial of service, automatic lockouts initiated by systems are, in most cases, temporary and automatically release after a predetermined period established by the organization (i.e., a delay algorithm). If a delay algorithm is selected, organizations may employ different algorithms for different system components based on the capabilities of the respective components. Responses to unsuccessful logon attempts may be implemented at the operating system and the application levels.
<u>3.1.9</u>	SECURITY REQUIREMENT Provide privacy and security notices consistent with applicable CUI rules.
	DISCUSSION System use notifications can be implemented using messages or warning banners displayed before individuals log in to organizational systems. System use notifications are used only for access via logon interfaces with human users and are not required when such human interfaces do not exist. Based on an assessment of risk, organizations consider whether a secondary system use notification is needed to access applications or other system resources after the initial network logon. Where necessary, posters or other printed materials may be used in lieu of an automated system banner. Organizations should consult with the Office of the General Counsel for legal review and approval of warning banner content.

<u>3.1.10</u>	SECURITY REQUIREMENT Use session lock with pattern-hiding displays to prevent access and viewing of data after a period of inactivity.
	DISCUSSION <p>Session locks are temporary actions taken when users stop work and move away from the immediate vicinity of the system but do not want to log out because of the temporary nature of their absences. Session locks are implemented where session activities can be determined, typically at the operating system level (but can also be at the application level). Session locks are not an acceptable substitute for logging out of the system, for example, if organizations require users to log out at the end of the workday.</p> <p>Pattern-hiding displays can include static or dynamic images, for example, patterns used with screen savers, photographic images, solid colors, clock, battery life indicator, or a blank screen, with the additional caveat that none of the images convey controlled unclassified information.</p>
<u>3.1.11</u>	SECURITY REQUIREMENT Terminate (automatically) a user session after a defined condition.
	DISCUSSION <p>This requirement addresses the termination of user-initiated logical sessions in contrast to the termination of network connections that are associated with communications sessions (i.e., disconnecting from the network). A logical session (for local, network, and remote access) is initiated whenever a user (or process acting on behalf of a user) accesses an organizational system. Such user sessions can be terminated (and thus terminate user access) without terminating network sessions. Session termination terminates all processes associated with a user's logical session except those processes that are specifically created by the user (i.e., session owner) to continue after the session is terminated. Conditions or trigger events requiring automatic session termination can include, for example, organization-defined periods of user inactivity, targeted responses to certain types of incidents, and time-of-day restrictions on system use.</p>
<u>3.1.12</u>	SECURITY REQUIREMENT Monitor and control remote access sessions.
	DISCUSSION <p>Remote access is access to organizational systems by users (or processes acting on behalf of users) communicating through external networks (e.g., the Internet). Remote access methods include, for example: dial-up, broadband, and wireless. Organizations often employ encrypted virtual private networks (VPNs) to enhance confidentiality over remote connections. The use of encrypted VPNs does not make the access non-remote; however, the use of VPNs, when adequately provisioned with appropriate safeguards (e.g., employing encryption techniques for confidentiality protection), may provide sufficient assurance to the organization that it can effectively treat such connections as internal networks. VPNs with encrypted tunnels can affect the capability to adequately monitor network communications traffic for malicious code.</p> <p>Automated monitoring and control of remote access sessions allows organizations to detect cyber-attacks and help to ensure ongoing compliance with remote access policies by auditing connection activities of remote users on a variety of system components (e.g., servers, workstations, notebook computers, smart phones, and tablets).</p> <p>NIST Special Publications 800-46, 800-77, and 800-113 provide guidance on secure remote access and virtual private networks.</p>

3.1.13	SECURITY REQUIREMENT Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.
	DISCUSSION Generally applicable cryptographic standards include FIPS-validated cryptography and NSA-approved cryptography. See NIST Cryptographic Standards ; NIST Cryptographic Module Validation Program ; NIST Cryptographic Algorithm Validation Program ; NSA Cryptographic Standards.
3.1.14	SECURITY REQUIREMENT Route remote access via managed access control points.
	DISCUSSION Routing all remote access through managed access control points enhances explicit, organizational control over such connections, reducing the susceptibility to unauthorized access to organizational systems resulting in the unauthorized disclosure of CUI.
3.1.15	SECURITY REQUIREMENT Authorize remote execution of privileged commands and remote access to security-relevant information.
	DISCUSSION A privileged command is a human-initiated (interactively or via a process operating on behalf of the human) command executed on a system involving the control, monitoring, or administration of the system including security functions and associated security-relevant information. Security-relevant information is any information within the system that can potentially impact the operation of security functions or the provision of security services in a manner that could result in failure to enforce the system security policy or maintain isolation of code and data. Privileged commands give individuals the ability to execute sensitive, security-critical, or security-relevant system functions. Controlling such access from remote locations helps to ensure that unauthorized individuals are not able to execute such commands freely with the potential to do serious or catastrophic damage to organizational systems. Note that the ability to affect the integrity of the system is considered security-relevant as that could enable the means to by-pass security functions although not directly impacting the function itself.
3.1.16	SECURITY REQUIREMENT Authorize wireless access prior to allowing such connections.
	DISCUSSION Establishing usage restrictions and configuration/connection requirements for wireless access to the system provides criteria for organizations to support wireless access authorization decisions. Such restrictions and requirements reduce the susceptibility to unauthorized access to the system through wireless technologies. Wireless networks use authentication protocols which provide credential protection and mutual authentication. NIST Special Publications 800-48 and 800-97 provide guidance on secure wireless networks.

3.1.17	SECURITY REQUIREMENT Protect wireless access using authentication and encryption.
	DISCUSSION Organizations can authenticate individuals and devices to help protect wireless access to the system. Special attention should be given to the wide variety of devices that are part of the Internet of Things with potential wireless access to organizational systems. See NIST Cryptographic Standards .
3.1.18	SECURITY REQUIREMENT Control connection of mobile devices.
	DISCUSSION A mobile device is a computing device that has a small form factor such that it can easily be carried by a single individual; is designed to operate without a physical connection (e.g., wirelessly transmit or receive information); possesses local, non-removable or removable data storage; and includes a self-contained power source. Mobile devices may also include voice communication capabilities, on-board sensors that allow the device to capture information, or built-in features for synchronizing local data with remote locations. Examples of mobile devices include smart phones, e-readers, and tablets. Due to the large variety of mobile devices with different technical characteristics and capabilities, organizational restrictions may vary for the different types of devices. Usage restrictions and implementation guidance for mobile devices include, for example: configuration management; device identification and authentication; implementation of mandatory protective software (e.g., malicious code detection, firewall); scanning devices for malicious code; updating virus protection software; scanning for critical software updates and patches; conducting primary operating system (and possibly other resident software) integrity checks; and disabling unnecessary hardware (e.g., wireless, infrared). The need to provide adequate security for mobile devices goes beyond this requirement. Many safeguards for mobile devices are reflected in other CUI security requirements. NIST Special Publication 800-124 provides guidance on mobile device security.
3.1.19	SECURITY REQUIREMENT Encrypt CUI on mobile devices and mobile computing platforms.
	DISCUSSION Organizations can use full-device encryption or container-based encryption to protect the confidentiality of CUI on mobile devices and computing platforms. Container-based encryption provides a more fine-grained approach to the encryption of data and information including, for example, encrypting selected data structures such as files, records, or fields. See NIST Cryptographic Standards .
3.1.20	SECURITY REQUIREMENT Verify and control/limit connections to and use of external systems.
	DISCUSSION External systems are systems or components of systems for which organizations typically have no direct supervision and authority over the application of security requirements and controls or the determination of the effectiveness of implemented safeguards on those systems. External systems include, for example, personally owned systems or devices and privately-owned computing and communications devices resident in commercial or public facilities. This requirement also addresses the use of external systems for the processing, storage, or transmission of CUI, including accessing

	<p>cloud services (e.g., infrastructure as a service, platform as a service, or software as a service) from organizational systems.</p> <p>Organizations establish terms and conditions for the use of external systems in accordance with organizational security policies and procedures. Terms and conditions address as a minimum, the types of applications that can be accessed on organizational systems from external systems. If terms and conditions with the owners of external systems cannot be established, organizations may impose restrictions on organizational personnel using those external systems.</p> <p>This requirement recognizes that there are circumstances where individuals using external systems (e.g., contractors, coalition partners) need to access organizational systems. In those situations, organizations need confidence that the external systems contain the necessary safeguards so as not to compromise, damage, or otherwise harm organizational systems. Verification that the required safeguards have been implemented can be achieved, for example, by third-party, independent assessments, attestations, or other means, depending on the assurance or confidence level required by organizations.</p> <p>Note that while “external” typically refers to outside of the organization’s direct supervision and authority, that is not always the case. Regarding the protection of CUI across an organization, the organization may have systems that process CUI and others that do not. And among the systems that process CUI there are likely access restrictions for CUI that apply between systems. Therefore, from the perspective of a given system, other systems within the organization may be considered “external” to that system.</p>
<u>3.1.21</u>	<p>SECURITY REQUIREMENT</p> <p>Limit use of portable storage devices on external systems.</p>
	<p>DISCUSSION</p> <p>Limits on the use of organization-controlled portable storage devices in external systems include, for example, complete prohibition of the use of such devices or restrictions on how the devices may be used and under what conditions the devices may be used. Note that while “external” typically refers to outside of the organization’s direct supervision and authority, that is not always the case. Regarding the protection of CUI across an organization, the organization may have systems that process CUI and others that do not. And among the systems that process CUI there are likely access restrictions for CUI that apply between systems. Therefore, from the perspective of a given system, other systems within the organization may be considered “external” to that system.</p>
<u>3.1.22</u>	<p>SECURITY REQUIREMENT</p> <p>Control CUI posted or processed on publicly accessible systems.</p>
	<p>DISCUSSION</p> <p>In accordance with laws, Executive Orders, directives, policies, regulations, or standards, the public is not authorized access to nonpublic information (e.g., information protected under the Privacy Act, CUI, and proprietary information). This requirement addresses systems that are controlled by the organization and accessible to the public, typically without identification or authentication. Individuals authorized to post CUI onto publicly accessible systems are designated. The content of information is reviewed prior to posting onto publicly accessible systems to ensure that nonpublic information is not included.</p>

TABLE F-2: DISCUSSION ON AWARENESS AND TRAINING REQUIREMENTS

<u>3.2.1</u>	SECURITY REQUIREMENT <p>Ensure that managers, systems administrators, and users of organizational systems are made aware of the security risks associated with their activities and of the applicable policies, standards, and procedures related to the security of those systems.</p>
	DISCUSSION <p>Organizations determine the content and frequency of security awareness training and security awareness techniques based on the specific organizational requirements and the systems to which personnel have authorized access. The content includes a basic understanding of the need for information security and user actions to maintain security and to respond to suspected security incidents. The content also addresses awareness of the need for operations security. Security awareness techniques can include, for example, formal training, offering supplies inscribed with security reminders, generating email advisories or notices from organizational officials, displaying logon screen messages, displaying posters, and conducting information security awareness events.</p> <p>NIST Special Publication 800-50 provides guidance on security awareness and training programs.</p>
<u>3.2.2</u>	SECURITY REQUIREMENT <p>Ensure that personnel are trained to carry out their assigned information security-related duties and responsibilities.</p>
	DISCUSSION <p>Organizations determine the content and frequency of security training based on the assigned duties, roles, and responsibilities of individuals and the security requirements of organizations and the systems to which personnel have authorized access. In addition, organizations provide system developers, enterprise architects, security architects, acquisition/procurement officials, software developers, system developers, system or network administrators, personnel conducting configuration management and auditing activities, personnel performing independent verification and validation activities, security assessors, and other personnel having access to system-level software, adequate security-related technical training specifically tailored for their assigned duties.</p> <p>Comprehensive role-based training addresses management, operational, and technical roles and responsibilities covering physical, personnel, and technical safeguards. Such training can include, for example, policies, procedures, tools, and artifacts for the organizational security roles defined. Organizations also provide the training necessary for individuals to carry out their responsibilities related to operations and supply chain security within the context of organizational information security programs.</p> <p>NIST Special Publication 800-181 provides guidance on role-based information security training in the workplace.</p>
<u>3.2.3</u>	SECURITY REQUIREMENT <p>Provide security awareness training on recognizing and reporting potential indicators of insider threat.</p>
	DISCUSSION <p>Potential indicators and possible precursors of insider threat include behaviors such as: inordinate, long-term job dissatisfaction; attempts to gain access to information that is not required for job performance; unexplained access to financial resources; bullying or sexual harassment of fellow employees; workplace violence; and other serious violations of organizational policies, procedures, directives, rules, or practices. Security awareness training includes how to communicate employee and management concerns regarding potential indicators of insider threat through appropriate organizational channels in accordance with established organizational policies and procedures. Organizations may consider tailoring insider threat awareness topics to the role (e.g., training for managers may be focused on specific changes in behavior of team members, while training for employees may be focused on more general observations).</p>

TABLE F-3: DISCUSSION ON AUDIT AND ACCOUNTABILITY REQUIREMENTS

<u>3.3.1</u>	SECURITY REQUIREMENT Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.
	DISCUSSION <p>An event is any observable occurrence in a system, which includes unlawful or unauthorized system activity. Organizations identify event types for which a logging functionality is needed as those events which are significant and relevant to the security of systems and the environments in which those systems operate to meet specific and ongoing auditing needs. Event types can include, for example, password changes, failed logons or failed accesses related to systems, administrative privilege usage, or third-party credential usage. In determining event types that require logging, organizations consider the monitoring and auditing appropriate for each of the CUI security requirements. Monitoring and auditing requirements can be balanced with other system needs. For example, organizations may determine that systems must have the capability to log every file access both successful and unsuccessful, but not activate that capability except for specific circumstances due to the potential burden on system performance.</p> <p>Audit records can be generated at various levels of abstraction, including at the packet level as information traverses the network. Selecting the appropriate level of abstraction is a critical aspect of an audit logging capability and can facilitate the identification of root causes to problems. Organizations consider in the definition of event types, the logging necessary to cover related events such as the steps in distributed, transaction-based processes (e.g., processes that are distributed across multiple organizations) and actions that occur in service-oriented or cloud-based architectures.</p> <p>Audit record content that may be necessary to satisfy this requirement includes, for example, time stamps, source and destination addresses, user/process identifiers, event descriptions, success/fail indications, filenames involved, and access control or flow control rules invoked. Event outcomes can include indicators of event success or failure and event-specific results (e.g., the security state of the system after the event occurred).</p> <p>Detailed information that organizations may consider in audit records includes, for example, full text recording of privileged commands or the individual identities of group account users. Organizations consider limiting the additional audit log information to only that information explicitly needed for specific audit requirements. This facilitates the use of audit trails and audit logs by not including information that could potentially be misleading or could make it more difficult to locate information of interest. Audit logs are reviewed and analyzed as often as needed to provide important information to organizations to facilitate risk-based decision making.</p> <p>NIST Special Publication 800-92 provides guidance on security log management.</p>
<u>3.3.2</u>	SECURITY REQUIREMENT Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.
	DISCUSSION <p>This requirement ensures that the contents of the audit record include the information needed to link the audit event to the actions of an individual to the extent feasible. Organizations consider logging for traceability including, for example, results from monitoring of account usage, remote access, wireless connectivity, mobile device connection, configuration settings, use of maintenance tools, nonlocal maintenance, physical access, temperature and humidity, equipment delivery and removal, system component inventory, communications at the system boundaries, use of mobile code, and use of VoIP.</p>

<u>3.3.3</u>	SECURITY REQUIREMENT Review and update logged events.
	DISCUSSION The intent of this requirement is to periodically re-evaluate which of the logged events will continue to be included in the list of events to be logged. Over time, the event types that are logged by organizations may change. Reviewing and updating the set of logged event types periodically is necessary to ensure that the current set remains necessary and sufficient.
<u>3.3.4</u>	SECURITY REQUIREMENT Alert in the event of an audit logging process failure.
	DISCUSSION Audit logging process failures include, for example, software/hardware errors, failures in the audit record capturing mechanisms, and audit record storage capacity being reached or exceeded. This requirement applies to each audit record data storage repository (i.e., distinct system component where audit records are stored), the total audit record storage capacity of organizations (i.e., all audit record data storage repositories combined), or both.
<u>3.3.5</u>	SECURITY REQUIREMENT Correlate audit record review, analysis, and reporting processes for investigation and response to indications of unlawful, unauthorized, suspicious, or unusual activity.
	DISCUSSION Correlating these processes helps to ensure that they do not operate independently, but rather collectively. Regarding the assessment of a given organizational system, the requirement is agnostic as to whether this correlation is applied at the system level or at the organization level across all systems.
<u>3.3.6</u>	SECURITY REQUIREMENT Provide audit record reduction and report generation to support on-demand analysis and reporting.
	DISCUSSION Audit record reduction is a process that manipulates collected audit information and organizes such information in a summary format that is more meaningful to analysts. Audit record reduction and report generation capabilities do not always emanate from the same system or organizational entities conducting auditing activities. Audit record reduction capability can include, for example, modern data mining techniques with advanced data filters to identify anomalous behavior in audit records. The report generation capability provided by the system can help generate customizable reports. Time ordering of audit records can be a significant issue if the granularity of the time stamp in the record is insufficient.
<u>3.3.7</u>	SECURITY REQUIREMENT Provide a system capability that compares and synchronizes internal system clocks with an authoritative source to generate time stamps for audit records.
	DISCUSSION Internal system clocks are used to generate time stamps, which include date and time. Time is expressed in Coordinated Universal Time (UTC), a modern continuation of Greenwich Mean Time (GMT), or local time with an offset from UTC. The granularity of time measurements refers to the degree of synchronization between system clocks and reference clocks, for example, clocks synchronizing within hundreds of milliseconds or within tens of milliseconds. Organizations may define different time granularities for different system components. Time service can also be critical to other security capabilities such as access control and identification and authentication,

	<p>depending on the nature of the mechanisms used to support those capabilities. This requirement provides uniformity of time stamps for systems with multiple system clocks and systems connected over a network.</p> <p>See IETF Network Time Protocol.</p>
3.3.8	<p>SECURITY REQUIREMENT</p> <p>Protect audit information and audit logging tools from unauthorized access, modification, and deletion.</p>
	<p>DISCUSSION</p> <p>Audit information includes all information (e.g., audit records, audit log settings, and audit reports) needed to successfully audit system activity. Audit logging tools are those programs and devices used to conduct audit and logging activities. This requirement focuses on the technical protection of audit information and limits the ability to access and execute audit logging tools to authorized individuals. Physical protection of audit information is addressed by media protection and physical and environmental protection requirements.</p>
3.3.9	<p>SECURITY REQUIREMENT</p> <p>Limit management of audit logging functionality to a subset of privileged users.</p>
	<p>DISCUSSION</p> <p>Individuals with privileged access to a system and who are also the subject of an audit by that system, may affect the reliability of audit information by inhibiting audit logging activities or modifying audit records. This requirement specifies that privileged access be further defined between audit-related privileges and other privileges, thus limiting the users with audit-related privileges.</p>

TABLE F-4: DISCUSSION ON CONFIGURATION MANAGEMENT REQUIREMENTS

<u>3.4.1</u>	SECURITY REQUIREMENT Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.
	DISCUSSION <p>This requirement establishes baseline configurations for systems and system components including communications and connectivity aspects of systems. Baseline configurations are documented, formally reviewed, and agreed-upon sets of specifications for systems or configuration items within those systems. Baseline configurations serve as a basis for future builds, releases, and changes to systems. Baseline configurations include information about system components (e.g., standard software packages installed on workstations, notebook computers, servers, network components, or mobile devices; current version numbers and update and patch information on operating systems and applications; and configuration settings and parameters), network topology, and the logical placement of those components within the system architecture. Baseline configurations of systems reflect the current enterprise architecture. Maintaining effective baseline configurations requires creating new baselines as organizational systems change over time. Baseline configuration maintenance includes reviewing and updating the baseline configuration when changes are made based on security risks and deviations from the established baseline configuration</p> <p>Organizations can implement centralized system component inventories that include components from multiple organizational systems. In such situations, organizations ensure that the resulting inventories include system-specific information required for proper component accountability (e.g., system association, system owner). Information deemed necessary for effective accountability of system components includes, for example, hardware inventory specifications, software license information, software version numbers, component owners, and for networked components or devices, machine names and network addresses. Inventory specifications include, for example, manufacturer, device type, model, serial number, and physical location.</p> <p>NIST Special Publication 800-128 provides guidance on security-focused configuration management</p>
<u>3.4.2</u>	SECURITY REQUIREMENT Establish and enforce security configuration settings for information technology products employed in organizational systems.
	DISCUSSION <p>Configuration settings are the set of parameters that can be changed in hardware, software, or firmware components of the system that affect the security posture or functionality of the system. Information technology products for which security-related configuration settings can be defined include, for example, mainframe computers, servers, workstations, input/output devices (e.g., scanners, copiers, and printers), network components (e.g., firewalls, routers, gateways, voice and data switches, devices, wireless access points, network appliances, sensors), operating systems, middleware, and applications.</p> <p>Security parameters are those parameters impacting the security state of systems including the parameters required to satisfy other security requirements. Security parameters include, for example: registry settings; account, file, directory permission settings; and settings for functions, ports, protocols, and remote connections. Organizations establish organization-wide configuration settings and subsequently derive specific configuration settings for systems. The established settings become part of the systems configuration baseline.</p> <p>Common secure configurations (also referred to as security configuration checklists, lockdown and hardening guides, security reference guides, security technical implementation guides) provide recognized, standardized, and established benchmarks that stipulate secure configuration settings for specific information technology platforms/products and instructions for configuring those system components to meet operational requirements. Common secure configurations can be developed by a variety of organizations including, for example, information technology product</p>

	<p>developers, manufacturers, vendors, consortia, academia, industry, federal agencies, and other organizations in the public and private sectors.</p> <p>NIST Special Publications 800-70 and 800-128 provide guidance on security configuration settings.</p>
<u>3.4.3</u>	<p>SECURITY REQUIREMENT</p> <p>Track, review, approve or disapprove, and log changes to organizational systems.</p>
	<p>DISCUSSION</p> <p>Tracking, reviewing, approving/disapproving, and logging changes is called configuration change control. Configuration change control for organizational systems involves the systematic proposal, justification, implementation, testing, review, and disposition of changes to the systems, including system upgrades and modifications. Configuration change control includes changes to baseline configurations for components and configuration items of systems, changes to configuration settings for information technology products (e.g., operating systems, applications, firewalls, routers, and mobile devices), unscheduled and unauthorized changes, and changes to remediate vulnerabilities.</p> <p>Processes for managing configuration changes to systems include, for example, Configuration Control Boards or Change Advisory Boards that review and approve proposed changes to systems. For new development systems or systems undergoing major upgrades, organizations consider including representatives from development organizations on the Configuration Control Boards or Change Advisory Boards. Audit logs of changes include activities before and after changes are made to organizational systems and the activities required to implement such changes.</p> <p>NIST Special Publication 800-128 provides guidance on configuration change control.</p>
<u>3.4.4</u>	<p>SECURITY REQUIREMENT</p> <p>Analyze the security impact of changes prior to implementation.</p>
	<p>DISCUSSION</p> <p>Organizational personnel with information security responsibilities (e.g., system administrators, system security officers, system security managers, and systems security engineers) conduct security impact analyses. Individuals conducting security impact analyses possess the necessary skills and technical expertise to analyze the changes to systems and the associated security ramifications. Security impact analysis may include, for example, reviewing security plans to understand security requirements and reviewing system design documentation to understand the implementation of safeguards and how specific changes might affect the safeguards. Security impact analyses may also include risk assessments to better understand the impact of the changes and to determine if additional safeguards are required.</p> <p>NIST Special Publication 800-128 provides guidance on configuration change control and security impact analysis.</p>
<u>3.4.5</u>	<p>SECURITY REQUIREMENT</p> <p>Define, document, approve, and enforce physical and logical access restrictions associated with changes to organizational systems.</p>
	<p>DISCUSSION</p> <p>Any changes to the hardware, software, or firmware components of systems can potentially have significant effects on the overall security of the systems. Therefore, organizations permit only qualified and authorized individuals to access systems for purposes of initiating changes, including upgrades and modifications. Access restrictions for change also include software libraries.</p> <p>Access restrictions include, for example, physical and logical access control requirements, workflow automation, media libraries, abstract layers (e.g., changes implemented into external interfaces rather than directly into systems), and change windows (e.g., changes occur only during specified times). In addition to security concerns, commonly-accepted due diligence for configuration</p>

	<p>management includes access restrictions as an essential part in ensuring the ability to effectively manage the configuration.</p> <p>NIST Special Publication 800-128 provides guidance on configuration change control.</p>
3.4.6	<p>SECURITY REQUIREMENT</p> <p>Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.</p>
	<p>DISCUSSION</p> <p>Systems can provide a wide variety of functions and services. Some of the functions and services routinely provided by default, may not be necessary to support essential organizational missions, functions, or operations. It is sometimes convenient to provide multiple services from single system components, but doing so increases risk over limiting the services provided by any one component. Where feasible, organizations limit component functionality to a single function per component.</p> <p>Organizations review functions and services provided by systems or components of systems, to determine which functions and services are candidates for elimination. Organizations disable unused or unnecessary physical and logical ports and protocols to prevent unauthorized connection of devices, transfer of information, and tunneling. Organizations can utilize network scanning tools, intrusion detection and prevention systems, and end-point protections such as firewalls and host-based intrusion detection systems to identify and prevent the use of prohibited functions, ports, protocols, and services.</p>
3.4.7	<p>SECURITY REQUIREMENT</p> <p>Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.</p>
	<p>DISCUSSION</p> <p>Restricting the use of nonessential software (programs) includes, for example, restricting the roles allowed to approve program execution; prohibiting auto-execute; program blacklisting and whitelisting; or restricting the number of program instances executed at the same time. The organization makes a security-based determination which functions, ports, protocols, and/or services are restricted. Bluetooth, FTP, and peer-to-peer networking are examples of protocols organizations consider preventing the use of, restricting, or disabling.</p>
3.4.8	<p>SECURITY REQUIREMENT</p> <p>Apply deny-by-exception (blacklisting) policy to prevent the use of unauthorized software or deny-all, permit-by-exception (whitelisting) policy to allow the execution of authorized software.</p>
	<p>DISCUSSION</p> <p>The process used to identify software programs that are not authorized to execute on systems is commonly referred to as blacklisting. The process used to identify software programs that are authorized to execute on systems is commonly referred to as whitelisting. Whitelisting is the stronger of the two policies for restricting software program execution. In addition to whitelisting, organizations consider verifying the integrity of whitelisted software programs using, for example, cryptographic checksums, digital signatures, or hash functions. Verification of whitelisted software can occur either prior to execution or at system startup.</p> <p>NIST Special Publication 800-167 provides guidance on application whitelisting.</p>
3.4.9	<p>SECURITY REQUIREMENT</p> <p>Control and monitor user-installed software.</p>
	<p>DISCUSSION</p> <p>Users can install software in organizational systems if provided the necessary privileges. To maintain control over the software installed, organizations identify permitted and prohibited</p>

actions regarding software installation through policies. Permitted software installations include, for example, updates and security patches to existing software and downloading applications from organization-approved “app stores.” Prohibited software installations may include, for example, software with unknown or suspect pedigrees or software that organizations consider potentially malicious. The policies organizations select governing user-installed software may be organization-developed or provided by some external entity. Policy enforcement methods include procedural methods, automated methods, or both.

TABLE F-5: DISCUSSION ON IDENTIFICATION AND AUTHENTICATION REQUIREMENTS

<u>3.5.1</u>	SECURITY REQUIREMENT Identify system users, processes acting on behalf of users, and devices.
	DISCUSSION Common device identifiers include, for example, media access control (MAC), Internet protocol (IP) addresses, or device-unique token identifiers. Management of individual identifiers is not applicable to shared system accounts. Typically, individual identifiers are the user names associated with the system accounts assigned to those individuals. Organizations may require unique identification of individuals in group accounts or for detailed accountability of individual activity. In addition, this requirement addresses individual identifiers that are not necessarily associated with system accounts. Organizational devices requiring identification may be defined by type, by device, or by a combination of type/device. NIST Special Publication 800-63 provides guidance on digital identities.
<u>3.5.2</u>	SECURITY REQUIREMENT Authenticate (or verify) the identities of users, processes, or devices, as a prerequisite to allowing access to organizational systems.
	DISCUSSION Individual authenticators include, for example, passwords, key cards, cryptographic devices, and one-time password devices. Initial authenticator content is the actual content of the authenticator, for example, the initial password. In contrast, the requirements about authenticator content include, for example, the minimum password length. Developers ship system components with factory default authentication credentials to allow for initial installation and configuration. Default authentication credentials are often well known, easily discoverable, and present a significant security risk. Systems support authenticator management by organization-defined settings and restrictions for various authenticator characteristics including, for example, minimum password length, validation time window for time synchronous one-time tokens, and number of allowed rejections during the verification stage of biometric authentication. Authenticator management includes issuing and revoking, when no longer needed, authenticators for temporary access such as that required for remote maintenance. Device authenticators include, for example, certificates and passwords. NIST Special Publication 800-63 provides guidance on digital identities.
<u>3.5.3</u>	SECURITY REQUIREMENT Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.
	DISCUSSION Multifactor authentication requires the use of two or more different factors to authenticate. The factors are defined as something you know (e.g., password, personal identification number [PIN]); something you have (e.g., cryptographic identification device, token); or something you are (e.g., biometric). Multifactor solutions that feature physical authenticators include, for example, hardware authenticators providing time-based or challenge-response authenticators and smart cards. In addition to authenticating users at the system level (i.e., at logon), organizations may also employ authentication mechanisms at the application level, when necessary, to provide increased information security. Access to organizational systems is defined as local access or network access. Local access is any access to organizational systems by users (or processes acting on behalf of users) where such access is obtained by direct connections without the use of networks. Network access is access to systems by users (or processes acting on behalf of users) where such access is obtained through network connections (i.e., nonlocal accesses). Remote access is a type of network access that involves communication through external networks. The use of encrypted virtual private networks for

	<p>network connections between organization-controlled endpoints and non-organization controlled endpoints may be treated as internal networks with regard to protecting the confidentiality of information traversing the network.</p> <p>NIST Special Publication 800-63 provides guidance on digital identities.</p>
<u>3.5.4</u>	<p>SECURITY REQUIREMENT</p> <p>Employ replay-resistant authentication mechanisms for network access to privileged and non-privileged accounts.</p>
	<p>DISCUSSION</p> <p>Authentication processes resist replay attacks if it is impractical to successfully authenticate by recording or replaying previous authentication messages. Replay-resistant techniques include, for example, protocols that use nonces or challenges such as time synchronous or challenge-response one-time authenticators.</p> <p>NIST Special Publication 800-63 provides guidance on digital identities.</p>
<u>3.5.5</u>	<p>SECURITY REQUIREMENT</p> <p>Prevent reuse of identifiers for a defined period.</p>
	<p>DISCUSSION</p> <p>Identifiers are provided for users, processes acting on behalf of users, or devices (3.5.1). Preventing reuse of identifiers implies preventing the assignment of previously used individual, group, role, or device identifiers to different individuals, groups, roles, or devices.</p>
<u>3.5.6</u>	<p>SECURITY REQUIREMENT</p> <p>Disable identifiers after a defined period of inactivity.</p>
	<p>DISCUSSION</p> <p>Inactive identifiers pose a risk to organizational information because attackers may exploit an inactive identifier to gain undetected access to organizational devices. The owners of the inactive accounts may not notice if unauthorized access to the account has been obtained.</p>
<u>3.5.7</u>	<p>SECURITY REQUIREMENT</p> <p>Enforce a minimum password complexity and change of characters when new passwords are created.</p>
	<p>DISCUSSION</p> <p>This requirement applies to single-factor authentication of individuals using passwords as individual or group authenticators, and in a similar manner, when passwords are used as part of multifactor authenticators. The number of changed characters refers to the number of changes required with respect to the total number of positions in the current password. To mitigate certain brute force attacks against passwords, organizations may also consider salting passwords.</p>
<u>3.5.8</u>	<p>SECURITY REQUIREMENT</p> <p>Prohibit password reuse for a specified number of generations.</p>
	<p>DISCUSSION</p> <p>Password lifetime restrictions do not apply to temporary passwords.</p>

<u>3.5.9</u>	SECURITY REQUIREMENT Allow temporary password use for system logons with an immediate change to a permanent password.
	DISCUSSION Changing temporary passwords to permanent passwords immediately after system logon ensures that the necessary strength of the authentication mechanism is implemented at the earliest opportunity, reducing the susceptibility to authenticator compromises.
<u>3.5.10</u>	SECURITY REQUIREMENT Store and transmit only cryptographically-protected passwords.
	DISCUSSION Cryptographically-protected passwords include, for example, salted one-way cryptographic hashes of passwords. See <u>NIST Cryptographic Standards</u> .
<u>3.5.11</u>	SECURITY REQUIREMENT Obscure feedback of authentication information.
	DISCUSSION The feedback from systems does not provide information that would allow unauthorized individuals to compromise authentication mechanisms. For some types of systems or system components, for example, desktop or notebook computers with relatively large monitors, the threat (often referred to as shoulder surfing) may be significant. For other types of systems or components, for example, mobile devices with small displays, this threat may be less significant, and is balanced against the increased likelihood of typographic input errors due to the small keyboards. Therefore, the means for obscuring the authenticator feedback is selected accordingly. Obscuring authenticator feedback includes, for example, displaying asterisks when users type passwords into input devices, or displaying feedback for a very limited time before fully obscuring it.

TABLE F-6: DISCUSSION ON INCIDENT RESPONSE REQUIREMENTS

<u>3.6.1</u>	SECURITY REQUIREMENT Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.
	DISCUSSION <p>Organizations recognize that incident handling capability is dependent on the capabilities of organizational systems and the mission/business processes being supported by those systems. Organizations consider incident handling as part of the definition, design, and development of mission/business processes and systems. Incident-related information can be obtained from a variety of sources including, for example, audit monitoring, network monitoring, physical access monitoring, user and administrator reports, and reported supply chain events. Effective incident handling capability includes coordination among many organizational entities including, for example, mission/business owners, system owners, authorizing officials, human resources offices, physical and personnel security offices, legal departments, operations personnel, procurement offices, and the risk executive.</p> <p>As part of user response activities, incident response training is provided by organizations and is linked directly to the assigned roles and responsibilities of organizational personnel to ensure that the appropriate content and level of detail is included in such training. For example, regular users may only need to know who to call or how to recognize an incident on the system; system administrators may require additional training on how to handle or remediate incidents; and incident responders may receive more specific training on forensics, reporting, system recovery, and restoration. Incident response training includes user training in the identification/reporting of suspicious activities from external and internal sources. User response activities also includes incident response assistance which may consist of help desk support, assistance groups, and access to forensics services or consumer redress services, when required. NIST Special Publication 800-61 provides guidance on incident handling.</p> <p>NIST Special Publications 800-86 and 800-101 provide guidance on integrating forensic techniques into incident response.</p>
<u>3.6.2</u>	SECURITY REQUIREMENT Track, document, and report incidents to designated officials and/or authorities both internal and external to the organization.
	DISCUSSION <p>Tracking and documenting system security incidents includes, for example, maintaining records about each incident, the status of the incident, and other pertinent information necessary for forensics, evaluating incident details, trends, and handling. Incident information can be obtained from a variety of sources including, for example, incident reports, incident response teams, audit monitoring, network monitoring, physical access monitoring, and user/administrator reports.</p> <p>Reporting incidents addresses specific incident reporting requirements within an organization and the formal incident reporting requirements for the organization. Suspected security incidents may also be reported and include, for example, the receipt of suspicious email communications that can potentially contain malicious code. The types of security incidents reported, the content and timeliness of the reports, and the designated reporting authorities reflect applicable laws, Executive Orders, directives, regulations, and policies.</p> <p>NIST Special Publication 800-61 provides guidance on incident handling.</p>

<u>3.6.3</u>	SECURITY REQUIREMENT Test the organizational incident response capability.
	DISCUSSION Organizations test incident response capabilities to determine the overall effectiveness of the capabilities and to identify potential weaknesses or deficiencies. Incident response testing includes, for example, the use of checklists, walk-through or tabletop exercises, simulations (parallel and full interrupt), and comprehensive exercises. Incident response testing can also include a determination of the effects on organizational operations (e.g., reduction in mission capabilities), organizational assets, and individuals due to incident response. NIST Special Publication 800-84 provides guidance on testing programs for information technology capabilities.

TABLE F-7: DISCUSSION ON MAINTENANCE REQUIREMENTS

<u>3.7.1</u>	SECURITY REQUIREMENT Perform maintenance on organizational systems.
	DISCUSSION This requirement addresses the information security aspects of the system maintenance program and applies to all types of maintenance to any system component (including hardware, firmware, applications) conducted by any local or nonlocal entity. System maintenance also includes those components not directly associated with information processing and data or information retention such as scanners, copiers, and printers.
<u>3.7.2</u>	SECURITY REQUIREMENT Provide controls on the tools, techniques, mechanisms, and personnel used to conduct system maintenance.
	DISCUSSION This requirement addresses security-related issues with maintenance tools that are not within the organizational system boundaries that process, store, or transmit CUI, but are used specifically for diagnostic and repair actions on those systems. Organizations have flexibility in determining the controls in place for maintenance tools, but can include approving, controlling, and monitoring the use of such tools. Maintenance tools are potential vehicles for transporting malicious code, either intentionally or unintentionally, into a facility and into organizational systems. Maintenance tools can include hardware, software, and firmware items, for example, hardware and software diagnostic test equipment and hardware and software packet sniffers.
<u>3.7.3</u>	SECURITY REQUIREMENT Ensure equipment removed for off-site maintenance is sanitized of any CUI.
	DISCUSSION This control addresses the information security aspects of system maintenance that is performed off-site and applies to all types of maintenance to any system component (including applications) conducted by a local or nonlocal entity (e.g., in-contract, warranty, in-house, software maintenance agreement). NIST Special Publication 800-88 provides guidance on media sanitization.
<u>3.7.4</u>	SECURITY REQUIREMENT Check media containing diagnostic and test programs for malicious code before the media are used in organizational systems.
	DISCUSSION If, upon inspection of media containing maintenance diagnostic and test programs, organizations determine that the media contain malicious code, the incident is handled consistent with incident handling policies and procedures.
<u>3.7.5</u>	SECURITY REQUIREMENT Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.
	DISCUSSION Nonlocal maintenance and diagnostic activities are those activities conducted by individuals communicating through an external network. Authentication techniques used in the establishment of these nonlocal maintenance and diagnostic sessions reflect the network access requirements in 3.5.3.

<u>3.7.6</u>	SECURITY REQUIREMENT Supervise the maintenance activities of maintenance personnel without required access authorization.
	DISCUSSION This requirement applies to individuals performing hardware or software maintenance on organizational systems, while 3.10.1 addresses physical access for individuals whose maintenance duties place them within the physical protection perimeter of the systems (e.g., custodial staff, physical plant maintenance personnel). Individuals not previously identified as authorized maintenance personnel, such as information technology manufacturers, vendors, consultants, and systems integrators, may require privileged access to organizational systems, for example, when required to conduct maintenance activities with little or no notice. Organizations may choose to issue temporary credentials to these individuals based on organizational risk assessments. Temporary credentials may be for one-time use or for very limited time periods.

TABLE F-8: DISCUSSION ON MEDIA PROTECTION REQUIREMENTS

<u>3.8.1</u>	SECURITY REQUIREMENT Protect (i.e. physically control and securely store) system media containing CUI, both paper and digital.
	DISCUSSION System media includes digital and non-digital media. Digital media includes, for example, diskettes, magnetic tapes, external and removable hard disk drives, flash drives, compact disks, and digital video disks. Non-digital media includes, for example, paper and microfilm. Protecting digital media includes, for example, limiting access to design specifications stored on compact disks or flash drives in the media library to the project leader and any individuals on the development team. Physically controlling system media includes, for example, conducting inventories, maintaining accountability for stored media, and ensuring procedures are in place to allow individuals to check out and return media to the media library. Secure storage includes, for example, a locked drawer, desk, or cabinet, or a controlled media library. Access to CUI on system media can be limited by physically controlling such media, which includes, for example, conducting inventories, ensuring procedures are in place to allow individuals to check out and return media to the media library, and maintaining accountability for all stored media. NIST Special Publication 800-111 provides guidance on storage encryption technologies for end user devices.
<u>3.8.2</u>	SECURITY REQUIREMENT Limit access to CUI on system media to authorized users.
	DISCUSSION Access can be limited by physically controlling system media and secure storage. Physically controlling system media includes, for example, conducting inventories, ensuring procedures are in place to allow individuals to check out and return media to the media library, and maintaining accountability for all stored media. Secure storage includes, for example, a locked drawer, desk, or cabinet, or a controlled media library.
<u>3.8.3</u>	SECURITY REQUIREMENT Sanitize or destroy system media containing CUI before disposal or release for reuse.
	DISCUSSION This requirement applies to all system media, digital and non-digital, subject to disposal or reuse, whether or not the media is considered removable. Examples include: digital media found in scanners, copiers, printers, notebook computers, workstations, network components, and mobile devices; and non-digital media such as paper and microfilm. The sanitization process removes information from the media such that the information cannot be retrieved or reconstructed. Sanitization techniques, including clearing, purging, cryptographic erase, and destruction, prevent the disclosure of information to unauthorized individuals when such media is released for reuse or disposal. Organizations determine the appropriate sanitization methods, recognizing that destruction may be necessary when other methods cannot be applied to media requiring sanitization. Organizations use discretion on the employment of approved sanitization techniques and procedures for media containing information in the public domain or publicly releasable, or deemed to have no adverse impact on organizations or individuals if released for reuse or disposal. Sanitization of non-digital media includes, for example, destruction, removing CUI from a document, or redacting selected sections or words from a document by obscuring the redacted sections or words in a manner equivalent in effectiveness to removing the words or sections from the document. NARA policy and guidance control the sanitization process for controlled unclassified information.

	See NARA Sanitization Policy and Guidance. NIST Special Publication 800-88 provides guidance on media sanitization.
3.8.4	SECURITY REQUIREMENT Mark media with necessary CUI markings and distribution limitations.
	DISCUSSION The term <i>security marking</i> refers to the application or use of human-readable security attributes. System media includes digital and non-digital media. Marking of system media reflects applicable federal laws, Executive Orders, directives, policies, and regulations. See NARA Marking Handbook .
3.8.5	SECURITY REQUIREMENT Control access to media containing CUI and maintain accountability for media during transport outside of controlled areas.
	DISCUSSION Controlled areas are areas or spaces for which organizations provide physical or procedural safeguards to meet the requirements established for protecting systems and information. Safeguards to maintain accountability for media during transport include, for example, locked containers and cryptography. Cryptographic mechanisms can provide confidentiality and integrity protections depending upon the mechanisms used. Activities associated with transport include the actual transport as well as those activities such as releasing media for transport and ensuring that media enters the appropriate transport processes. For the actual transport, authorized transport and courier personnel may include individuals from outside the organization. Maintaining accountability of media during transport includes, for example, restricting transport activities to authorized personnel, and tracking and obtaining explicit records of transport activities as the media moves through the transportation system to prevent and detect loss, destruction, or tampering.
3.8.6	SECURITY REQUIREMENT Implement cryptographic mechanisms to protect the confidentiality of CUI stored on digital media during transport unless otherwise protected by alternative physical safeguards.
	DISCUSSION This requirement applies to portable storage devices (e.g., USB memory sticks, digital video disks, compact disks, external or removable hard disk drives). NIST Special Publication 800-111 provides guidance on storage encryption technologies for end user devices. See NIST Cryptographic Standards .
3.8.7	SECURITY REQUIREMENT Control the use of removable media on system components.
	DISCUSSION In contrast to requirement 3.8.1 , which restricts user access to media, this requirement restricts the use of certain types of media on systems, for example, restricting or prohibiting the use of flash drives or external hard disk drives. Organizations can employ technical and nontechnical safeguards (e.g., policies, procedures, rules of behavior) to control the use of system media. Organizations may control the use of portable storage devices, for example, by using physical cages on workstations to prohibit access to certain external ports, or disabling or removing the ability to insert, read, or write to such devices. Organizations may also limit the use of portable storage devices to only approved devices including, for example, devices provided by the organization, devices provided by other approved

	organizations, and devices that are not personally owned. Finally, organizations may control the use of portable storage devices based on the type of device, for example, prohibiting the use of writeable, portable storage devices, and implementing this restriction by disabling or removing the capability to write to such devices.
<u>3.8.8</u>	SECURITY REQUIREMENT Prohibit the use of portable storage devices when such devices have no identifiable owner.
	DISCUSSION Requiring identifiable owners (e.g., individuals, organizations, or projects) for portable storage devices reduces the risk of using such technologies by allowing organizations to assign responsibility and accountability for addressing known vulnerabilities in the devices (e.g., insertion of malicious code).
<u>3.8.9</u>	SECURITY REQUIREMENT Protect the confidentiality of backup CUI at storage locations.
	DISCUSSION Organizations can employ cryptographic mechanisms or alternative physical safeguards to protect the confidentiality of backup information at designated storage locations. Backed-up information containing CUI may include system-level information and user-level information. System-level information includes, for example, system-state information, operating system software and application software, and licenses. User-level information includes information other than system-level information.

TABLE F-9: DISCUSSION ON PERSONNEL SECURITY REQUIREMENTS

<u>3.9.1</u>	SECURITY REQUIREMENT Screen individuals prior to authorizing access to organizational systems containing CUI.
	DISCUSSION Personnel screening activities reflect applicable federal laws, Executive Orders, directives, policies, regulations, and specific criteria established for the level of access required for assigned positions.
<u>3.9.2</u>	SECURITY REQUIREMENT Ensure that organizational systems containing CUI are protected during and after personnel actions such as terminations and transfers.
	DISCUSSION Protecting CUI during and after personnel actions may include, for example, return of system-related property and exit interviews. System-related property includes, for example, hardware authentication tokens, identification cards, system administration technical manuals, keys, and building passes. Exit interviews ensure that individuals who have been terminated understand the security constraints imposed by being former employees and that proper accountability is achieved for system-related property. Security topics of interest at exit interviews can include, for example, reminding terminated individuals of nondisclosure agreements and potential limitations on future employment. Exit interviews may not be possible for some terminated individuals, for example, in cases related to job abandonment, illnesses, and non-availability of supervisors. For termination actions, timely execution is essential for individuals terminated for cause. In certain situations, organizations consider disabling the system accounts of individuals that are being terminated prior to the individuals being notified. This requirement applies to reassignments or transfers of individuals when the personnel action is permanent or of such extended durations as to require protection. Organizations define the CUI protections appropriate for the types of reassignments or transfers, whether permanent or extended. Protections that may be required for transfers or reassignments to other positions within organizations include, for example, returning old and issuing new keys, identification cards, and building passes; closing system accounts and establishing new accounts; changing system access authorizations (i.e., privileges); and providing for access to official records to which individuals had access at previous work locations and in previous system accounts.

TABLE F-10: DISCUSSION ON PHYSICAL PROTECTION REQUIREMENTS

<u>3.10.1</u>	SECURITY REQUIREMENT Limit physical access to organizational systems, equipment, and the respective operating environments to authorized individuals.
	DISCUSSION <p>This requirement applies to organizational employees, individuals with permanent physical access authorization credentials, and visitors. Authorized individuals have credentials which include, for example, badges, identification cards, and smart cards. Organizations determine the strength of authorization credentials needed consistent with applicable laws, directives, policies, regulations, standards, procedures, and guidelines. This requirement applies only to areas within facilities that have not been designated as publicly accessible.</p> <p>Limiting physical access to equipment may include, for example, placing equipment in locked rooms or other secured areas and allowing access to authorized individuals only, and placing equipment in locations that can be monitored by organizational personnel. Computing devices, external hard disk drives, networking devices, monitors, printers, copiers, scanners, facsimile machines, and audio devices are examples of equipment.</p>
<u>3.10.2</u>	SECURITY REQUIREMENT Protect and monitor the physical facility and support infrastructure for organizational systems.
	DISCUSSION Monitoring of physical access includes publicly accessible areas within organizational facilities. This can be accomplished, for example, by the employment of guards; the use of sensor devices; or the use of video surveillance equipment such as cameras. Examples of support infrastructure include system distribution, transmission, and power lines. Security safeguards applied to the support infrastructure prevent accidental damage, disruption, and physical tampering. Such safeguards may also be necessary to help prevent eavesdropping or modification of unencrypted transmissions. Safeguards used to control physical access to support infrastructure include, for example, locked wiring closets; disconnected or locked spare jacks; protection of cabling by conduit or cable trays; and wiretapping sensors.
<u>3.10.3</u>	SECURITY REQUIREMENT Escort visitors and monitor visitor activity.
	DISCUSSION Individuals with permanent physical access authorization credentials are not considered visitors. Audit logs can be used to monitor visitor activity.
<u>3.10.4</u>	SECURITY REQUIREMENT Maintain audit logs of physical access.
	DISCUSSION Organizations have flexibility in the types of audit logs employed. Audit logs can be procedural (e.g., a written log of individuals accessing the facility and when such access occurred), automated (e.g., capturing ID provided by a PIV card), or some combination thereof. Physical access points can include facility access points, interior access points to systems or system components requiring supplemental access controls, or both. Components of systems (e.g., workstations, notebook computers) may be in areas designated as publicly accessible with organizations safeguarding access to such devices.

<u>3.10.5</u>	SECURITY REQUIREMENT Control and manage physical access devices.
	DISCUSSION Physical access devices include, for example, keys, locks, combinations, and card readers.
<u>3.10.6</u>	SECURITY REQUIREMENT Enforce safeguarding measures for CUI at alternate work sites.
	DISCUSSION Alternate work sites may include, for example, government facilities or private residences of employees. Organizations may define different security requirements for specific alternate work sites or types of sites depending on the work-related activities conducted at those sites. NIST Special Publications 800-46 and 800-114 provide guidance on enterprise and user security when teleworking.

TABLE F-11: DISCUSSION ON RISK ASSESSMENT REQUIREMENTS

<u>3.11.1</u>	SECURITY REQUIREMENT Periodically assess the risk to organizational operations (including mission, functions, image, or reputation), organizational assets, and individuals, resulting from the operation of organizational systems and the associated processing, storage, or transmission of CUI.
	DISCUSSION Clearly defined system boundaries are a prerequisite for effective risk assessments. Such risk assessments consider threats, vulnerabilities, likelihood, and impact to organizational operations, organizational assets, and individuals based on the operation and use of organizational systems. Risk assessments also consider risk from external parties (e.g., service providers, contractors operating systems on behalf of the organization, individuals accessing organizational systems, outsourcing entities). Risk assessments, either formal or informal, can be conducted at the organization level, the mission or business process level, or the system level, and at any phase in the system development life cycle. NIST Special Publication 800-30 provides guidance on conducting risk assessments.
<u>3.11.2</u>	SECURITY REQUIREMENT Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting those systems and applications are identified.
	DISCUSSION Organizations determine the required vulnerability scanning for all system components, ensuring that potential sources of vulnerabilities such as networked printers, scanners, and copiers are not overlooked. The vulnerabilities to be scanned are readily updated as new vulnerabilities are discovered, announced, and scanning methods developed. This process ensures that potential vulnerabilities in the system are identified and addressed as quickly as possible. Vulnerability analyses for custom software applications may require additional approaches such as static analysis, dynamic analysis, binary analysis, or a hybrid of the three approaches. Organizations can employ these analysis approaches in source code reviews and in a variety of tools (e.g., static analysis tools, web-based application scanners, binary analyzers) and in source code reviews. Vulnerability scanning includes, for example: scanning for patch levels; scanning for functions, ports, protocols, and services that should not be accessible to users or devices; and scanning for improperly configured or incorrectly operating information flow control mechanisms. To facilitate interoperability, organizations consider using products that are Security Content Automated Protocol (SCAP)-validated, scanning tools that express vulnerabilities in the Common Vulnerabilities and Exposures (CVE) naming convention, and that use the Open Vulnerability Assessment Language (OVAL) to determine the presence of vulnerabilities. Sources for vulnerability information include the Common Weakness Enumeration (CWE) listing and the National Vulnerability Database (NVD). Security assessments, such as red team exercises, provide additional sources of potential vulnerabilities for which to scan. Organizations also consider using scanning tools that express vulnerability impact by the Common Vulnerability Scoring System (CVSS). In certain situations, the nature of the vulnerability scanning may be more intrusive or the system component that is the subject of the scanning may contain highly sensitive information. Privileged access authorization to selected system components facilitates thorough vulnerability scanning and protects the sensitive nature of such scanning. NIST Special Publication 800-40 provides guidance on vulnerability management.

<u>3.11.3</u>	SECURITY REQUIREMENT Remediate vulnerabilities in accordance with risk assessments.
	DISCUSSION Vulnerabilities discovered, for example, via the scanning conducted in response to 3.11.2, are remediated with consideration of the related assessment of risk. The consideration of risk influences the prioritization of remediation efforts and the level of effort to be expended in the remediation for specific vulnerabilities.

TABLE F-12: DISCUSSION ON SECURITY ASSESSMENT REQUIREMENTS

<u>3.12.1</u>	SECURITY REQUIREMENT Periodically assess the security controls in organizational systems to determine if the controls are effective in their application.
	DISCUSSION <p>Organizations assess security controls in organizational systems and the environments in which those systems operate as part of the system development life cycle. Security controls are the safeguards or countermeasures organizations implement to satisfy security requirements. By assessing the implemented security controls, organizations determine if the security safeguards or countermeasures are in place and operating as intended. Security control assessments ensure that information security is built into organizational systems; identify weaknesses and deficiencies early in the development process; provide essential information needed to make risk-based decisions; and ensure compliance to vulnerability mitigation procedures. Assessments are conducted on the implemented security controls as documented in system security plans.</p> <p>Security assessment reports document assessment results in sufficient detail as deemed necessary by organizations, to determine the accuracy and completeness of the reports and whether the security controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting security requirements. Security assessment results are provided to the individuals or roles appropriate for the types of assessments being conducted.</p> <p>Organizations ensure that security assessment results are current, relevant to the determination of security control effectiveness, and obtained with the appropriate level of assessor independence. Organizations can choose to use other types of assessment activities such as vulnerability scanning and system monitoring to maintain the security posture of systems during the life cycle. NIST Special Publication 800-53A provides guidance on developing security assessment plans and for conducting assessments.</p> <p>NIST Special Publication 800-53 provides guidance on security and privacy controls for systems and organizations.</p>
<u>3.12.2</u>	SECURITY REQUIREMENT Develop and implement plans of action designed to correct deficiencies and reduce or eliminate vulnerabilities in organizational systems.
	DISCUSSION <p>The plan of action is a key document in the information security program. Organizations develop plans of action that describe how any unimplemented security requirements will be met and how any planned mitigations will be implemented. Organizations can document the system security plan and plan of action as separate or combined documents and in any chosen format.</p> <p>Federal agencies may consider the submitted system security plans and plans of action as critical inputs to an overall risk management decision to process, store, or transmit CUI on a system hosted by a nonfederal organization and whether it is advisable to pursue an agreement or contract with the nonfederal organization.</p>
<u>3.12.3</u>	SECURITY REQUIREMENT Monitor security controls on an ongoing basis to ensure the continued effectiveness of the controls.
	DISCUSSION <p>Continuous monitoring programs facilitate ongoing awareness of threats, vulnerabilities, and information security to support organizational risk management decisions. The terms <i>continuous</i> and <i>ongoing</i> imply that organizations assess and analyze security controls and information security-related risks at a frequency sufficient to support risk-based decisions. The results of continuous monitoring programs generate appropriate risk response actions by organizations. Providing access</p>

	<p>to security information on a continuing basis through reports or dashboards gives organizational officials the capability to make more effective and timely risk management decisions.</p> <p>Automation supports more frequent updates to hardware, software, firmware inventories, and other system information. Effectiveness is further enhanced when continuous monitoring outputs are formatted to provide information that is specific, measurable, actionable, relevant, and timely. Monitoring requirements, including the need for specific monitoring, may also be referenced in other requirements.</p> <p>NIST Special Publication 800-137 provides guidance on continuous monitoring.</p>
<u>3.12.4</u>	<p>SECURITY REQUIREMENT</p> <p>Develop, document, and periodically update system security plans that describe system boundaries, system environments of operation, how security requirements are implemented, and the relationships with or connections to other systems.</p>
	<p>DISCUSSION</p> <p>System security plans relate security requirements to a set of security controls. System security plans also describe, at a high level, how the security controls meet those security requirements, but do not provide detailed, technical descriptions of the specific design or implementation of the controls. Security plans contain sufficient information to enable a design and implementation that is unambiguously compliant with the intent of the plans and subsequent determinations of risk if the plan is implemented as intended. Security plans need not be single documents; the plans can be a collection of various documents including documents that already exist. Effective security plans make extensive use of references to policies, procedures, and additional documents (e.g., design and implementation specifications) where more detailed information can be obtained. This reduces the documentation requirements associated with security programs and maintains security-related information in other established management/operational areas related to enterprise architecture, system development life cycle, systems engineering, and acquisition.</p> <p>Federal agencies may consider the submitted system security plans and plans of action as critical inputs to an overall risk management decision to process, store, or transmit CUI on a system hosted by a nonfederal organization and whether it is advisable to pursue an agreement or contract with the nonfederal organization.</p> <p>NIST Special Publication 800-18 provides guidance on developing security plans.</p>

TABLE F-13: DISCUSSION ON SYSTEM AND COMMUNICATIONS PROTECTION REQUIREMENTS

<u>3.13.1</u>	SECURITY REQUIREMENT Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.
	DISCUSSION <p>Communications can be monitored, controlled, and protected at boundary components and by restricting or prohibiting interfaces in organizational systems. Boundary components include, for example, gateways, routers, firewalls, guards, network-based malicious code analysis and virtualization systems, or encrypted tunnels implemented within a system security architecture (e.g., routers protecting firewalls or application gateways residing on protected subnetworks). Restricting or prohibiting interfaces in organizational systems includes, for example, restricting external web traffic to designated web servers within managed interfaces and prohibiting external traffic that appears to be spoofing internal addresses.</p> <p>Organizations consider the shared nature of commercial telecommunications services in the implementation of security requirements associated with the use of such services. Commercial telecommunications services are commonly based on network components and consolidated management systems shared by all attached commercial customers, and may also include third party-provided access lines and other service elements. Such transmission services may represent sources of increased risk despite contract security provisions. NIST Special Publication 800-41 provides guidance on firewalls and firewall policy.</p> <p>NIST Special Publication 800-125 provides guidance on security for virtualization technologies.</p>
<u>3.13.2</u>	SECURITY REQUIREMENT Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.
	DISCUSSION <p>Organizations apply systems security engineering principles to new development systems or systems undergoing major upgrades. For legacy systems, organizations apply systems security engineering principles to system upgrades and modifications to the extent feasible, given the current state of hardware, software, and firmware components within those systems. The application of systems security engineering concepts and principles helps to develop trustworthy, secure, and resilient systems and system components and reduce the susceptibility of organizations to disruptions, hazards, and threats. Examples of these concepts and principles include developing layered protections; establishing security policies, architecture, and controls as the foundation for design; incorporating security requirements into the system development life cycle; delineating physical and logical security boundaries; ensuring that developers are trained on how to build secure software; and performing threat modeling to identify use cases, threat agents, attack vectors and patterns, design patterns, and compensating controls needed to mitigate risk. Organizations that apply security engineering concepts and principles can facilitate the development of trustworthy, secure systems, system components, and system services; reduce risk to acceptable levels; and make informed risk-management decisions.</p> <p>NIST Special Publication 800-160 provides guidance on systems security engineering.</p>
<u>3.13.3</u>	SECURITY REQUIREMENT Separate user functionality from system management functionality.
	DISCUSSION <p>System management functionality includes, for example, functions necessary to administer databases, network components, workstations, or servers, and typically requires privileged user access. The separation of user functionality from system management functionality is physical or</p>

	logical. Organizations can implement separation of system management functionality from user functionality by using different computers, different central processing units, different instances of operating systems, or different network addresses; virtualization techniques; or combinations of these or other methods, as appropriate. This type of separation includes, for example, web administrative interfaces that use separate authentication methods for users of any other system resources. Separation of system and user functionality may include isolating administrative interfaces on different domains and with additional access controls.
<u>3.13.4</u>	SECURITY REQUIREMENT Prevent unauthorized and unintended information transfer via shared system resources.
	DISCUSSION The control of information in shared system resources (e.g., registers, cache memory, main memory, hard disks) is also commonly referred to as object reuse and residual information protection. This requirement prevents information produced by the actions of prior users or roles (or the actions of processes acting on behalf of prior users or roles) from being available to any current users or roles (or current processes acting on behalf of current users or roles) that obtain access to shared system resources after those resources have been released back to the system. This requirement also applies to encrypted representations of information. This requirement does not address information remanence, which refers to residual representation of data that has been nominally deleted; covert channels (including storage or timing channels) where shared resources are manipulated to violate information flow restrictions; or components within systems for which there are only single users or roles.
<u>3.13.5</u>	SECURITY REQUIREMENT Implement subnetworks for publicly accessible system components that are physically or logically separated from internal networks.
	DISCUSSION Subnetworks that are physically or logically separated from internal networks are referred to as demilitarized zones (DMZs). DMZs are typically implemented with boundary control devices and techniques that include, for example, routers, gateways, firewalls, virtualization, or cloud-based technologies. NIST Special Publication 800-41 provides guidance on firewalls and firewall policy. NIST Special Publication 800-125 provides guidance on security for virtualization technologies.
<u>3.13.6</u>	SECURITY REQUIREMENT Deny network communications traffic by default and allow network communications traffic by exception (i.e., deny all, permit by exception).
	DISCUSSION This requirement applies to inbound and outbound network communications traffic, both at the system boundary and at identified points within the system. A deny-all, permit-by-exception network communications traffic policy ensures that only those connections which are essential and approved are allowed.
<u>3.13.7</u>	SECURITY REQUIREMENT Prevent remote devices from simultaneously establishing non-remote connections with organizational systems and communicating via some other connection to resources in external networks (i.e., split tunneling).
	DISCUSSION Split tunneling might be desirable by remote users to communicate with local system resources such as printers or file servers. However, split tunneling would allow unauthorized external connections, making the system more vulnerable to attack and to exfiltration of organizational information. This requirement is implemented in remote devices (e.g., notebook computers,

	tablets) through configuration settings to disable split tunneling in those devices, and by preventing configuration settings from being readily configurable by users. This requirement is implemented in the system by the detection of split tunneling (or of configuration settings that allow split tunneling) in the remote device, and by prohibiting the connection if the remote device is using split tunneling.
3.13.8	SECURITY REQUIREMENT Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.
	DISCUSSION This requirement applies to internal and external networks and any system components that can transmit information including, for example, servers, notebook computers, desktop computers, mobile devices, printers, copiers, scanners, and facsimile machines. Communication paths outside the physical protection of a controlled boundary are susceptible to interception and modification. Organizations relying on commercial providers offering transmission services as commodity services rather than as fully dedicated services (i.e., services which can be highly specialized to individual customer needs), may find it difficult to obtain the necessary assurances regarding the implementation of needed safeguards for transmission confidentiality. In such situations, organizations determine what types of confidentiality services are available in standard, commercial telecommunication service packages. If it is infeasible or impractical to obtain the necessary safeguards and assurances of the effectiveness of the safeguards through appropriate contracting vehicles, organizations implement compensating safeguards or explicitly accept the additional risk. An example of an alternative physical safeguard is a protected distribution system (PDS) where the distribution medium is protected against electronic or physical intercept, thereby ensuring the confidentiality of the information being transmitted. See NIST Cryptographic Standards .
3.13.9	SECURITY REQUIREMENT Terminate network connections associated with communications sessions at the end of the sessions or after a defined period of inactivity.
	DISCUSSION This requirement applies to internal and external networks. Terminating network connections associated with communications sessions include, for example, de-allocating associated TCP/IP address or port pairs at the operating system level, or de-allocating networking assignments at the application level if multiple application sessions are using a single, operating system-level network connection. Time periods of user inactivity may be established by organizations and include, for example, time periods by type of network access or for specific network accesses.
3.13.10	SECURITY REQUIREMENT Establish and manage cryptographic keys for cryptography employed in organizational systems.
	DISCUSSION Cryptographic key management and establishment can be performed using manual procedures or mechanisms supported by manual procedures. Organizations define key management requirements in accordance with applicable federal laws, Executive Orders, directives, regulations, policies, and standards, specifying appropriate options, levels, and parameters. NIST Special Publications 800-56 and 800-57 provide guidance on cryptographic key maintenance.

<u>3.13.11</u>	SECURITY REQUIREMENT Employ FIPS-validated cryptography when used to protect the confidentiality of CUI.
	DISCUSSION <p>Cryptography can be employed to support many security solutions including, for example, the protection of controlled unclassified information, the provision of digital signatures, and the enforcement of information separation when authorized individuals have the necessary clearances for such information but lack the necessary formal access approvals. Cryptography can also be used to support random number generation and hash generation. Generally applicable cryptographic standards include FIPS-validated cryptography and NSA-approved cryptography. This control does not impose any requirements on organizations to use cryptography. However, if cryptography is required based on other security requirements, organizations define each type of cryptographic use and the type of cryptography required (e.g., FIPS-validated cryptography).</p> <p>See NIST Cryptographic Standards; NIST Cryptographic Module Validation Program; NIST Cryptographic Algorithm Validation Program.</p>
<u>3.13.12</u>	SECURITY REQUIREMENT Prohibit remote activation of collaborative computing devices and provide indication of devices in use to users present at the device.
	DISCUSSION <p>Collaborative computing devices include, for example, networked white boards, cameras, and microphones. Indication of use includes, for example, signals to users when collaborative computing devices are activated. Dedicated video conferencing systems, which rely on one of the participants calling or connecting to the other party to activate the video conference, are excluded.</p>
<u>3.13.13</u>	SECURITY REQUIREMENT Control and monitor the use of mobile code.
	DISCUSSION <p>Mobile code technologies include, for example, Java, JavaScript, ActiveX, Postscript, PDF, Shockwave movies, Flash animations, and VBScript. Decisions regarding the use of mobile code in organizational systems are based on the potential for the code to cause damage to the systems if used maliciously. Usage restrictions and implementation guidance apply to the selection and use of mobile code installed on servers and mobile code downloaded and executed on individual workstations, notebook computers, and devices (e.g., smart phones). Mobile code policy and procedures address controlling or preventing the development, acquisition, or introduction of unacceptable mobile code in systems, including, for example, requiring mobile code to be digitally signed by a trusted source.</p> <p>NIST Special Publication 800-28 provides guidance on mobile code.</p>
<u>3.13.14</u>	SECURITY REQUIREMENT Control and monitor the use of Voice over Internet Protocol (VoIP) technologies.
	DISCUSSION <p>VoIP has different requirements, features, functionality, availability, and service limitations when compared with Plain Old Telephone Service (POTS) (i.e., the standard telephone service that most homes use). In contrast, other telephone services are based on high-speed, digital communications lines, such as Integrated Services Digital Network (ISDN) and Fiber Distributed Data Interface (FDDI). The main distinctions between POTS and non-POTS services are speed and bandwidth. To address the threats associated with VoIP, usage restrictions and implementation guidelines are based on the potential for the VoIP technology to cause damage to the system if it is used maliciously. Threats to VoIP are similar to those inherent with any Internet-based application.</p>

	NIST Special Publication 800-58 provides guidance on Voice Over IP Systems.
3.13.15	SECURITY REQUIREMENT Protect the authenticity of communications sessions.
	DISCUSSION Authenticity protection includes, for example, protecting against man-in-the-middle attacks, session hijacking, and the insertion of false information into communications sessions. This requirement addresses communications protection at the session versus packet level (e.g., sessions in service-oriented architectures providing web-based services) and establishes grounds for confidence at both ends of communications sessions in ongoing identities of other parties and in the validity of information transmitted. NIST Special Publications 800-52, 800-77, 800-95, and 800-113 provide guidance on secure communications sessions.
3.13.16	SECURITY REQUIREMENT Protect the confidentiality of CUI at rest.
	DISCUSSION Information at rest refers to the state of information when it is not in process or in transit and is located on storage devices as specific components of systems. The focus of protection at rest is not on the type of storage device or the frequency of access but rather the state of the information. Organizations can use different mechanisms to achieve confidentiality protections, including the use of cryptographic mechanisms and file share scanning. Organizations may also employ other safeguards including, for example, secure off-line storage in lieu of online storage when adequate protection of information at rest cannot otherwise be achieved or continuous monitoring to identify malicious code at rest. See NIST Cryptographic Standards .

TABLE F-14: DISCUSSION ON SYSTEM AND INFORMATION INTEGRITY REQUIREMENTS

<u>3.14.1</u>	SECURITY REQUIREMENT Identify, report, and correct system flaws in a timely manner.
	DISCUSSION <p>Organizations identify systems that are affected by announced software and firmware flaws including potential vulnerabilities resulting from those flaws, and report this information to designated personnel with information security responsibilities. Security-relevant updates include, for example, patches, service packs, hot fixes, and anti-virus signatures. Organizations also address flaws discovered during security assessments, continuous monitoring, incident response activities, and system error handling. Organizations can take advantage of available resources such as the Common Weakness Enumeration (CWE) or Common Vulnerabilities and Exposures (CVE) databases in remediating flaws discovered in organizational systems.</p> <p>Organization-defined time periods for updating security-relevant software and firmware may vary based on a variety of factors including, for example, the criticality of the update (i.e., severity of the vulnerability related to the discovered flaw). Some types of flaw remediation may require more testing than other types of remediation. NIST Special Publication 800-40 provides guidance on patch management technologies.</p>
<u>3.14.2</u>	SECURITY REQUIREMENT Provide protection from malicious code at designated locations within organizational systems.
	DISCUSSION <p>Designated locations include system entry and exit points which may include, for example, firewalls, remote-access servers, workstations, electronic mail servers, web servers, proxy servers, notebook computers, and mobile devices. Malicious code includes, for example, viruses, worms, Trojan horses, and spyware. Malicious code can be encoded in various formats (e.g., UUENCODE, Unicode), contained within compressed or hidden files, or hidden in files using techniques such as steganography. Malicious code can be inserted into systems in a variety of ways including, for example, web accesses, electronic mail, electronic mail attachments, and portable storage devices. Malicious code insertions occur through the exploitation of system vulnerabilities.</p> <p>Malicious code protection mechanisms include, for example, anti-virus signature definitions and reputation-based technologies. A variety of technologies and methods exist to limit or eliminate the effects of malicious code. Pervasive configuration management and comprehensive software integrity controls may be effective in preventing execution of unauthorized code. In addition to commercial off-the-shelf software, malicious code may also be present in custom-built software. This could include, for example, logic bombs, back doors, and other types of cyber-attacks that could affect organizational missions/business functions. Traditional malicious code protection mechanisms cannot always detect such code. In these situations, organizations rely instead on other safeguards including, for example, secure coding practices, configuration management and control, trusted procurement processes, and monitoring practices to help ensure that software does not perform functions other than the functions intended.</p> <p>NIST Special Publication 800-83 provides guidance on malware incident prevention.</p>
<u>3.14.3</u>	SECURITY REQUIREMENT Monitor system security alerts and advisories and take action in response.
	DISCUSSION <p>There are many publicly available sources of system security alerts and advisories. The United States Computer Emergency Readiness Team (US-CERT) generates security alerts and advisories to maintain situational awareness across the federal government and in nonfederal organizations. Software vendors, subscription services, and relevant industry information sharing and analysis centers (ISACs) may also provide security alerts and advisories. Examples of response actions</p>

	include notifying relevant external organizations, for example, external mission/business partners, supply chain partners, external service providers, and peer or supporting organizations.
<u>3.14.4</u>	SECURITY REQUIREMENT Update malicious code protection mechanisms when new releases are available.
	DISCUSSION Malicious code protection mechanisms include, for example, anti-virus signature definitions and reputation-based technologies. A variety of technologies and methods exist to limit or eliminate the effects of malicious code. Pervasive configuration management and comprehensive software integrity controls may be effective in preventing execution of unauthorized code. In addition to commercial off-the-shelf software, malicious code may also be present in custom-built software. This could include, for example, logic bombs, back doors, and other types of cyber-attacks that could affect organizational missions/business functions. Traditional malicious code protection mechanisms cannot always detect such code. In these situations, organizations rely instead on other safeguards including, for example, secure coding practices, configuration management and control, trusted procurement processes, and monitoring practices to help ensure that software does not perform functions other than the functions intended.
<u>3.14.5</u>	SECURITY REQUIREMENT Perform periodic scans of organizational systems and real-time scans of files from external sources as files are downloaded, opened, or executed.
	DISCUSSION Periodic scans of organizational systems and real-time scans of files from external sources can detect malicious code. Malicious code can be encoded in various formats (e.g., UUENCODE, Unicode), contained within compressed or hidden files, or hidden in files using techniques such as steganography. Malicious code can be inserted into systems in a variety of ways including, for example, web accesses, electronic mail, electronic mail attachments, and portable storage devices. Malicious code insertions occur through the exploitation of system vulnerabilities. Malicious code protection mechanisms include, for example, anti-virus signature definitions and reputation-based technologies. Many technologies and methods exist to limit or eliminate the effects of malicious code. Pervasive configuration management and comprehensive software integrity controls may be effective in preventing execution of unauthorized code. In addition to commercial off-the-shelf software, malicious code may also be present in custom-built software. This could include, for example, logic bombs, back doors, and other types of cyber-attacks that could affect organizational missions/business functions. Traditional malicious code protection mechanisms cannot always detect such code. In these situations, organizations rely instead on other safeguards including, for example, secure coding practices, configuration management and control, trusted procurement processes, and monitoring practices to help ensure that software does not perform functions other than the functions intended.
<u>3.14.6</u>	SECURITY REQUIREMENT Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.
	DISCUSSION System monitoring includes external and internal monitoring. External monitoring includes the observation of events occurring at the system boundary (i.e., part of perimeter defense and boundary protection). Internal monitoring includes the observation of events occurring within the system. Organizations can monitor systems, for example, by observing audit record activities in real time or by observing other system aspects such as access patterns, characteristics of access, and other actions. The monitoring objectives may guide determination of the events. System monitoring capability is achieved through a variety of tools and techniques (e.g., intrusion detection systems, intrusion prevention systems, malicious code protection software, scanning tools, audit record monitoring software, network monitoring software). Strategic locations for monitoring devices

	<p>include, for example, selected perimeter locations and near server farms supporting critical applications, with such devices being employed at managed system interfaces. The granularity of monitoring information collected is based on organizational monitoring objectives and the capability of systems to support such objectives.</p> <p>System monitoring is an integral part of continuous monitoring and incident response programs. Output from system monitoring serves as input to continuous monitoring and incident response programs. A network connection is any connection with a device that communicates through a network (e.g., local area network, Internet). A remote connection is any connection with a device communicating through an external network (e.g., the Internet). Local, network, and remote connections can be either wired or wireless.</p> <p>Unusual or unauthorized activities or conditions related to inbound and outbound communications traffic include, for example, internal traffic that indicates the presence of malicious code in systems or propagating among system components, the unauthorized exporting of information, or signaling to external systems. Evidence of malicious code is used to identify potentially compromised systems or system components. System monitoring requirements, including the need for specific types of system monitoring, may be referenced in other requirements.</p> <p>NIST Special Publication 800-94 provides guidance on intrusion detection and prevention systems.</p>
<p><u>3.14.7</u></p>	<p>SECURITY REQUIREMENT</p> <p>Identify unauthorized use of organizational systems.</p>
	<p>DISCUSSION</p> <p>System monitoring can detect unauthorized use of organizational systems. System monitoring includes external and internal monitoring. System monitoring is an integral part of continuous monitoring and incident response programs; it is achieved through a variety of tools and techniques (e.g., intrusion detection systems, intrusion prevention systems, malicious code protection software, scanning tools, audit record monitoring software, network monitoring software).
